If you follow Rome’s Ancient Appian Way out of the Porta Sebastiano southeast out of the city for about 10 miles, passing through a dry land with ancient Roman gravestones lining the road, you will come to a hill on the left. At the village of Genzano, you can follow the road around the base of the hill and ascend to the settlement called Nemi. Here, classical scholars knew, from classic texts such as Strabo and Ovid, that this place long ago was a sanctuary of Diana. Now, a few remaining columns overlook a lake nestled in a volcano’s remains, called “Diana’s Mirror.” Beneath the surface of contemporary small farms of olive, grapes, and strawberries was once a sacred shrine where have been found numerous votive statuettes and an image of a goddess, including one with an inscription to Diana: “as blessing men and women with offspring, and granting expectant mothers an easy delivery” (Fraser 1990, p. 5).

With a flourish of imaginative rhetoric, Frazer undertook to explain the meaning of what he thought took place long ago on this site: a “barbaric” custom in the sacred precinct related to a goddess-queen, in which a priest-king, once a runaway slave, must constantly carry a sword and be on the lookout for attacks. Any man who can pluck a bunch of mistletoe high in the sacred tree, then kill the ruling priest-king, can assume his role, but he will then be doomed to the same fate. Frazer argued that similar rituals were practiced far and wide, expressing patterns of human

nature and society, sinister, sensuous, and bloody. His psychology was an empiricist, rationalist effort to reduce passionate themes to past nonsense, but ironically, the undertone was psychological: an unconscious collective fascination with these passions – killing the king, mating with the queen (Oedipal), and mingling with the natural world.

Frazer's thesis unfolds as he conjectures that the King of the Wood at Nemi, Virbius, was likely the mortal lover and king of the goddess Diana (Artemis in Greece), whose spirit was to be found in the tree he guarded. Comparing this pair to other moral men and goddesses such as Adonis and Venus, Hippolytus and Phaedra, and Attis and the Cybele, Frazer proposes that the ritual at Nemi recapitulates the known mythic accounts of the goddess of fertility taking a lover who dies as in the annual death of planted seeds and is magically reborn in their rebirth as new vegetation. His theory is that the ritual led to myths about the annual cycles of vegetation, its winter death and rebirth in the spring that needed to be magically helped along by bloody and erotic human rites. The sacred marriage custom of priest-kings mating with priestess-goddess figures was the ritual of ensuring the fertility of the land. Diana was not known as a goddess of fertility, however. Her predecessor in Greece, Artemis, was a virgin huntress, but other more fertility-related goddesses such as the Greek Demeter and Gaia, the Babylonian Ishtar, Egyptian goddesses, notably Isis, and others that Frazer describes, he offered as testimonies to this practice as characteristic of archaic societies.

From the writings of world travelers, Frazer assiduously tried to link all this to other strange, faraway customs, such as those described by Captain James Alexander, Fifth Duke of Hamilton, an adventurous Scottish sailor who had wandered from the Cape of Good Hope to India and Japan for 35 years. In 1728, he published his *New Account of the East Indies*, where he reported kings committing suicide before their term of rule had expired. Another king at the end of his 12-year reign would throw a jolly feast for 12 days. If any of the guests could fight their way through his thousands of guards and kill the

king in his tent, they would become the new king (Fraser 1990, pp. 50–52). This apparent parallel to the Roman conundrum excited Frazer and became one of his many examples of what he claimed to be widespread practice of slaying the king and thereby grabbing his throne (Frazer 1922, Chap. 24; Hamilton 1728). Just under the surface of the supposedly rational concern lurk psychological fascinations with fear and blood, political rule, religious sacredness, and erotic fertility.

Taboo and Totem

Frazer elaborated on the reports with the concept of taboo, the sacred or cursed thing or person, like an electric force field, for example, possessing a king that spreads from his person to whatever he touched, sending divine power that promotes the growth of life on earth (Frazer 1922, Chaps. 19–22). Taboo was a concept fascinating to nineteenth-century anthropologists that Frazer used to help unify his collection of cases of “the king must die, long live the king.” It first appeared in English in the journal of Captain Cook, who stumbled onto the exotic practice of forbidden things in the Tongatapu Islands in the South Pacific (Cook 1785, Vol. 2, pp. xi, 410). Soon “taboo” came to describe many things, found also in the Bible, that were sacred and cursed, both unclean and untouchable, strong yet vulnerable, such as kings, blood, and corpses. Taboo was expanded to explain several practices, including the biblical scapegoat (Leviticus 16), used to ritually expel threatening evils from a community.

The totem was another recently uncovered practice that fascinated Europe. In 1885, John McLennan, the Scottish author of *Patriarchal Theory*, having discovered totems “thick under the feet” in the Arabic peninsula, lectured at Cambridge. Frazer was in the audience, and he quickly integrated totemism into his theories. He saw it in various ways as this thought developed. In his “depository theory,” he interpreted totems as containers for one's soul that kept it safely separated from the body that might be killed. This was expanded into the chapter on the External Soul (Frazer 1922, Chaps. 66–67). He saw the

mistletoe, or “golden bough,” as a totem hanging high in the oak tree above the king who was defending his rule from attack. His view of the golden mistletoe as a totem he connected to the reports of the Celtic Druid priestly ritual of cutting the plant with a golden sickle. But it is an imaginative stretch to portray the same sense of mistletoe, or any mistletoe, in an Italian shrine.

Studies of the Australian Aborigines shifted the interpretation of totemism toward the idea of a totem as an image of a clan’s founding ancestral spirit. It was used in the initiation of young men into adulthood in the outback and was part of the emphasis on exogamy, where a man could only marry outside his totem’s social group. A man might say of his totem that it is his brother, meaning his eternal soul participates in the same species as that totem animal, thus defining what he can kill. Hunters are typically forbidden to kill their totem animal, since it is a relative, except for special sacred occasions, Frazer explained (Frazer 1922, p. 799).

Fertility Religion

Frazer’s vegetation deity theory agreed with that of William Robertson Smith (1846–1894), coeditor of the ninth edition of the *Encyclopedia Britannica*, who had a large impact on Frazer, and invited him to write articles for it. Smith saw primitive religions as social institutions for the preservation of society, not as individual creeds for the saving of souls. This debate between those who see myth and religion as primarily social or as more psychological continued between the anthropologists (Boas 1994) and psychologists (Jung 1979). Smith also stressed the literalism of primitive religions, where tribal beliefs believed the people to be literal descendants of a fatherly god in whose blood his descendants participated. He believed that primitives saw gods not as remote and transcendent, but as limited to specific earthly places – grand trees or mountains. Such gods need not be anthropomorphic, but could be portrayed as plants or animals. Smith envisioned religion developing from demons to totems (such as the Semitic Arabic *jinn*s), to local gods, to

national gods, to universal gods. Smith’s use of the comparative religions method was to take a specific example, such as the *jinn*s, and then draw on other, perhaps far-reaching, parallels to confirm his theory (Smith 1889/2002).

Smith saw ancient sacrifices as the food of the gods. He insisted that sacrifices are not gifts to bartering gods, but communion between people and spirit beings. Quite unlike Freud, he saw this communion unstained by notions of moral and psychological sin or guilt, but as positive relations with a spirit. Unlike Hume, Frazer, and others, Smith argued that religion is not based on psychological fear, but on a happy sharing of the sacrificial food with the spirit being and with the community. The notion of sacrifice as atonement for sins developed later, he thought, when sacrificial animals (or humans) came to be seen as property to pay a divine debt (Smith 2002).

The priest-king was a role known to classicists such as Frazer for some time. Greek kings in Homeric literature were seen as sacred or divine, Frazer says, and that the rule of a good, healthy, strong king would bring fruitfulness to the land – wheat, sheep, fish, and babies would multiply plentifully. The principle was that if a king lost his virility, became sick, or unable to father children, the land’s fertility would suffer. The next step was the belief in the need to kill a weakening king and transfer his power to a stronger successor before the power faded. Frazer believed this to be illustrated in the riddle of the priest at Nemi, anxious to protect his life from attackers (Frazer 1922, Chap. 24).

Now we approach the core of Frazer’s theory. As he expanded his research and the number of volumes of *The Golden Bough*, he increasingly strengthened his central thesis that the core of “savage” magic and religion was the obsession with assuring the continuing cycle of divine powers for the growth of vegetation and animal reproduction (Frazer 1922, Chap. 28, p. 349). His thesis was centered on a vegetation religion – not a tribal totem religion, not a spiritual, transcendent god of morality religion, but the first rituals he thought to be repeatedly enacted to assure the fruitfulness of life on earth by keeping strong the divine powers of the priest-king. Frazer amplified his argument

with similar cases worldwide, as well as the development of the sacrifice of a substitute for the king – humans, animals, plants, or other valuables. The divine energy could be shared in the people's feasts following the ritual, which came to be called sacramental meals:

The worshipful animal is killed . . . that each of his worshippers may receive a portion of the divine virtues that are supposed to emanate from the dead or dying god (Frazer 1922, p. 623).

This suggests that the “other” religions who sacrificed and ate foods such as pork, opposed by “our” religion, might give our priests a way of forbidding us from joining them by making their sacramental foods psychologically taboo for us. Thus, Jewish and Muslim taboos on eating pork, for example, may come from the priests who saw their neighboring “pagans” eating pork sacrificed to Demeter in Greece and to Baal in Canaan.

Dying and Rising Gods

Still controversial is Frazer's argument that there have been numerous examples of dying and rising gods. He had no trouble finding examples in classic studies of eastern Mediterranean cultures: Adonis, Attis, Osiris, Dionysus, Persephone, and the “Corn-Mother” or “Corn-Spirit” (corn = grain) in plants and animals worldwide. Building on Wilhelm Mannhardt's theory of the *korndämonen*, Frazer interpreted these and many others as examples of his core theory: (a) the divine force behind the planting of seeds seems to die underground, (b) the growth of the plant is a resurrection of the apparently dead divine force, and (c) the rituals and myths of the dying and rising gods and goddesses express this fervent belief:

Under the names of Osiris, Tammuz, Adonis, and Attis, the people of Egypt and Western Asia represented the yearly decay and revival of life, especially of vegetable life, which they personified as a god who annually died and rose again from the dead (Frazer 1922, p. 378).

Frazer's critics, such as Andrew Lang, rejected the centrality of the vegetation spirit practices (Lang 1901), broadly attributing illogical archaic

myth, ritual, and religion to the premodern failure to distinguish between humans and other things in the world (Lang 1887, Chap. 3). Lang and others also rejected the comparative method, saying that he glossed over too many details that make the cases different (Boas 1994), thus making the concept of dying and rising gods impossible (Jonathan Z. Smith), but others today argue that the similarities are strong enough to make the comparative method valid and the dying and rising gods a convincing concept (Mettinger 2001).

Heady Non-Psychology

Frazer sought to find an overarching logic, however mistaken, in prescientific magic and religion. He tied the vegetation spirit theme into wider practices: the expulsion of evil in the scapegoat (Frazer 1922, Chaps. 55–58), the winter solstice fire festivals in Europe (Frazer 1922, Chaps. 62–63), including burning human sacrifices or effigies, and the myth of the death of the Nordic Balder by mistletoe (Frazer 1922, Chap. 65). This heady mixture made for a sweeping theory, pulling a vast range of ritualized phenomena into his single theory of the vegetation deity's annual cycle.

Frazer's theory was daring and exciting to Europeans waiting for explanations of other cultures' strangely erotic and bloody practices. In the guise of a thoroughly pragmatic, materialist theory that assured the fertility of the crops and animals, Frazer in theory rejected any role of emotion – no social or psychological motives are necessary, Frazer thought. But then he would hint at deeply psychological motives such as fear in this frothy mixture of bloody murder, political domination, erotic rituals, and life overcoming death, all happening among the “others,” just beneath the proper surface of his Victorian consciousness. Denying psychology, he elaborated on it with a flourish.

Though he was friends with and initially inspired by Frazer, Bronislaw Malinowski became a leader of the new, more empirical, field-oriented, revealing functionalist, twentieth-century anthropology that rejected the old-style

reckless armchair comparative speculations and insisted upon careful observations of behavior, limited to the context of an observed tribal society. His ethnography in the South Pacific set a new standard because he learned the language of the natives he was studying, became friends with some, and developed the classic theory of participant observation, a new anthropological methodology (Malinowski 1948). This development soon made Frazer professionally irrelevant among anthropologists, although the themes that he explored remained fascinating to them.

The myth and ritual school, a group of classicists, also called the “Cambridge Ritualists,” was influenced by Frazer, notably in their quest for the primitive roots of classical Greek ritual, drama, literature, society, and the theory of the priority of ritual to myth. They included Jane E. Harrison, Gilbert Murray, A. B. Cook, and Frances M. Cornford (Ackerman 1991).

Sigmund Freud

Sigmund Freud soon picked up on the unconscious elements in Frazerian themes, such as totem and taboo, with his Oedipal interpretation but gave more credit to the power of unconscious incest dynamics. In *Totem and Taboo* (1913/1950), Freud saw totems as ancestral fathers. But for him, this was a continuation of the historical events in his speculative theory of the “primal horde.” The strongest male mated with as many females as desired, and as his sons grew into puberty, lacking women, they killed him and mated with his wives. Thus, they were able to become men themselves, but felt terribly guilty, so set up a sacred totem animal as a substitute to be revered for the murdered father. The guilty sons felt the need to atone and reconcile with the dead father. So the sacrifice of the totem animal expresses both sides of the ambivalent totem psychology – anger and reverence – echoing the primal murder and penance for it down the generations. The whole ritual was saturated with Oedipal guilt and is thus filled with taboos. The strongest taboos in this situation are the taboos against disrespecting the fatherly ruler and dealing

with corpses. Freud sees these taboos as Oedipal guilt aversions. This was an elaboration on Freud’s theory that unconsciously, God is nothing more than an exalted father (Freud 1913/1950, p. 147), an extension of the primal totem, and so Christian communion is an unconscious repetition of the guilty primal murder of the father. Freud’s venture into anthropology was at least as reckless as Frazer’s, both extending the daring speculations of nineteenth-century thought. Freud fares better in the realm of clinical psychology, where unconscious dynamics are openly acknowledged (Freud 1913/1950).

Carl Jung

Carl Jung’s archetypal psychology of the collective unconscious shares some themes with Frazer, such as the comparison of motifs from cultures around the world. But Jung is interested not in grand theories of history based on myth, nor in evolution, magic, or fertility, but in healing. He focuses first on the patient’s feelings and dreams, his unconscious production of images that have parallels in collective images, such as the ego, the lover (*anima/animus*), or the shadow (Jung 1979, para. 1–42). Jung’s comparative method is much more focused and disciplined than Frazer’s speculations, even when he ventures into cultural reflections. Jung developed a strong theory of archetypal images that has had a major influence (often unacknowledged) on psychotherapeutic psychology, such as his archetypal image of the introvert and extravert typology.

For Jung, the divine is not Frazer’s vegetation spirit or Freud’s exalted father, but a far more refined archetypal experience that he named the “Self” (Jung 1979, para. 43–126). Subsequent Jungian analysts refined Jung’s thought even further. Jungian feminists corrected Jung’s pre-feminist views, exploring the goddess archetypal images (Bolen 1984). James Hillman criticizes Frazerian theories that portray themselves as doing science and revisions them as imaginative mythologies. While anthropology was striving to become more factual, Hillman’s archetypal psychology revisions old nineteenth-century

concepts such as Tylor's animism and Freud's Oedipus complex into archetypal mythologies (Hillman 1975, pp. 12, 18).

The development of Frazer's theory took place in the context of the development of the rise of Protestantism's higher biblical criticism, originating in Germany. Frazer came out of the Calvinist Presbyterian and Free Church struggles in Scotland and the debates in England, where Christianity was wrestling with issues such as the importance of a state church versus the need for nonconformist independent churches. Also, the German-based free-thinking biblical criticism that was taking the Bible apart as a historical document, heavily indebted to the customs of its time and editing processes, challenged the literal readings of the Bible (Kee 1997). This was consistent with the rise of comparative religion.

A fascinating blend of highly imaginative literary speculations with a page-turning effort to plumb the depths of the mysterious practices of societies strange to proper Victorian England, *The Golden Bough* has been thoroughly deconstructed but still carries some cultural impact. The 1922 condensation has not yet gone out of print. Although (or because) Frazer never traveled beyond Greece and had no interest in actually meeting a "savage," his book resonates in the collective unconscious of Western culture. It still carries a fascination that Cambridge Classicist Mary Beard recognized as a "metaphorical voyage into the unknown, the wild, the Other" (1992, p. 221). Much of its appeal has to do with its effort to separate European knowledge from the new societies appearing in the Europe's expanding horizon and to affirm the certainty of European epistemologies by denigrating the magical and religious practices of the "savages." Its oversimplified and shocking exposés served as a reassuring effort to legitimize European imperialism (Beard 1992, p. 217). It allowed readers to fantasize scandalous, dramatic, bloody, and fantastic rituals while striving to keep them at a distance as alien superstitions, by shoving their psychology into the unconscious.

Yet Frazer's work is not just a charming, tawdry antique. It has serious implications for the

interpretation of Jesus' death and resurrection that the study of world religions inevitably brought forth. If the dying and rising god theme was indeed common in Jesus' time, this was not the only account of a god on earth who died and was resurrected. But, the argument goes, the earlier cases were strictly vegetation deities, and Christ was a moral and spiritual reformer, not an image of the life-death cycle of plants. This, of course, was not enough for church leaders, who saw his theory as an intolerable attack on traditional Christianity's view of Jesus' resurrection as unique. Though an agnostic or atheist, Frazer attended church and had an uneasy conscience and a naive sense of the powerful impact that his kind of work would have on religions. He saw himself as a scientist who must seek truth despite the social consequences or sentiment, yet he held onto a conventional Christianity (Fraser 1990, p. 134; Sharpe 1975, pp. 87–94).

Although his material and methods have stimulated many, such as Freud and Jung, Frazer's preliminary use of the comparative method has become an easy target of criticism of the comparative studies of religion in general (Boas 1994; Malinowski 1948; Smith 2005). Thus, his research provides a major locus for exploring the value of that method in the study of world religions. However, the *Golden Bough* is a monumental compendium of material, accurate and inaccurate, recklessly speculative, naively rationalistic, and blandly confident in the archetypal mythology of "progress." Not unlike Freud's achievement of revealing the unconscious in psychology, and Jung's archetypal psychology, Frazer roughly sketched in broad outline many of the deep archaic roots that trouble contemporary society, far more erotic, bloody, mysterious, religious, and fascinating than the modern rational veneer that has developed since those dark, passionate rituals flourished. Subsequent psychological interpretations of the dramas that he described take a deeper approach. How Frazer's material might help us understand "irrational" behavior in current politics, society, and personal life remains an important topic of debate. For the study of world religions using the comparative method, the question lingers whether this method will

undermine religion or generate new religions and new “ecumenical” tolerance.

In 1959, Theodor Gaster published an updated, abridged version called *The New Golden Bough*, which sought to eliminate unreliable field reports and updated others, and modified Frazer’s theory somewhat in view of recent scholarship (Gaster 1959). But it was seen as a “misguided facelift,” not the needed critique (Hyman 1959, p. 439).

Frazer inspired many artists, such as James Joyce (*Ulysses*) and T. S. Eliot (Eliot wrote that in the *Waste Land*, his reference to the Tarot’s “Hanged Man” card: “is associated in my mind with the Hanged God of Frazer.” in Abrams et al. 1968, p. 2584). Discussing Joyce, Eliot also says: “Psychology... ethnology and The Golden Bough ... make possible what was impossible even a few years ago. Instead of narrative method we may now use the mythical method.” in Abrams et al. 1968, p. 2626). In 1959, Stanley Hyman’s book *The Tangled Bank: Darwin, Marx, Frazer and Freud as Imaginative Writers* interprets Frazer’s work as literature, which Frazer himself acknowledged, while still trying to cling to a scientific method (Hyman 1959, p. 244). Hyman (1959) points to Frazer’s “vast argument from analogy” (p. 237), using root metaphors, such as cultural evolution (p. 247), the mystical communion of “savages” as philosophers sharing in the spiritual powers of nature (p. 224), the image of explosives and electricity to describe the power of a king’s tabooed energy (p. 251), nature as a machine (p. 235), and the military metaphor of the long, slow war against superstition (p. 251). Hyman also pointed out the inconsistency of Frazer’s waffling theory of myth as intellectual, historical, or ritual in origin (1959, p. 239). Frazer certainly did write in the literary style that combined what was thought of as science in his time with the flowery rhetoric of an English gentleman. He could not describe a scene without elaborating on it artistically.

Mircea Eliade later developed a more careful and refined comparative study than Frazer’s, using the newer phenomenological method, blended with more reliable anthropological and historical studies. In his *Patterns in Comparative Religion* (1958), Eliade explored “hierophanies”

or appearance of the sacred in phenomena such as the sky, sun, moon, water, stones, earth, fertility, temples, time, and myths. He echoed Frazer dimly in his studies of vegetation and rites of regeneration in agricultural fertility cults. But for Eliade, “there has never been any real vegetation cult, any religion solely built upon plants and trees” (Eliade 1958, p. 325). The cycles of death and life are evident, although rooted in sacred hierophanies, not efforts to manipulate nature, which to science is mechanical. Eliade edited the first edition of the classic *Encyclopedia of Religion* (1987, 2nd ed. 2005), now the standard encyclopedia for the study of world religions. He was criticized, mostly from the empiricist anthropological side, for overgeneralizing and lacking sufficient observed support. But, having closely studied Hindu Yoga, for example, he believed that the symbolism of experiences of the sacred is based on reality (however it may be misinterpreted), not illusion. This was offensive to critics committed to the non-spiritual, non-symbolic scientific metaphysic (Smith 2005).

The debate continues over comparative religion’s value, wrestling with these themes. On the one side, how much should scholars of world religions acknowledge the reality of the sacred for believers and how much should they find some truths in symbolic, poetic language? On the other hand, how much should they use more scientific methods that do not acknowledge the reality of the sacred, even for believers, and emphasize the higher value of detailed, logical, more literal language and anthropological studies of specific societies? This is a major hermeneutic, methodological debate in our culture. Jonathan Z. Smith’s rejection of Frazer’s category of “Dying and Rising Gods” represents those who seek a more “scientific” method for comparative religion. Kimberly Patton’s *A Magic Still Dwells* represents those who think that meaningful symbolic comparisons can be made based on authentic experiences of sacred realities which cannot so easily be discredited by the scientific hermeneutic. Even scientific and postmodern skepticism about truth claims are not neutral, she argues, since they are based on imaginative and metaphysical presuppositions [such as the human

right to dominate an alien nature], not simply evidence. Nevertheless, situating general themes in various social contexts far more carefully than Frazer did, as well as carefully examining truth claims, is essential as comparative religion continues.

Institute of Practical Theology, University of
Bern, Bern, Switzerland

A landmark experiment in the history of the psychology of religion was the 1962 “Marsh Chapel Experiment,” also known as the “Good Friday Experiment,” and popularized in the press at the time as “The Miracle in Marsh Chapel.”

Twenty Christian seminarians participated in a double-blind study of psilocybin, designed by Walter N. Pahnke, a psychiatrist and ordained minister completing his doctoral work in the History and Philosophy of Religion at Harvard. While Howard Thurman preached on the Last Words of Christ in Marsh Chapel at Boston University, the clinical study took place in a basement sanctuary, directly below the pulpit, while the audio feed of the Good Friday worship service was broadcast into the space.

Pahnke wrote that the experiment investigated “in a systematic and scientific way the similarities and differences between experiences described by mystics and those facilitated by psychedelic drugs.” The results of the study, intentionally conducted in “a religious context” with religiously inclined individuals, led Pahnke and others to find “that psilocybin (and LSD and mescaline, by analogy) are important tools for the study of the mystical state of consciousness” (Pahnke 1966).

Walter Houston Clark, a professor of the psychology of religion, helped recruit the 20 white male volunteers from the Andover Newton Theological Seminary, where he taught. Eight of the ten who received psilocybin reported dramatic mystical experiences, and some reportedly wandered about the chapel crying aloud, “God is everywhere” and “Oh, the glory!” By contrast, only one of the ten control group (who were given Nicotinic Acid as an active placebo to maximize suggestion) participants experienced elevated mystical feelings. In addition, Pahnke recruited ten additional volunteers to serve as “guides.” Timothy Leary, the Harvard faculty sponsor for Pahnke’s experiment and co-leader of the Harvard Psilocybin Project, suggested that the guides also should be included in receiving psilocybin or placebos (Doblin 1991).

For scholars of religion, perhaps the most notable of these volunteer guides was Huston Smith, the foremost twentieth-century scholar of comparative world religions, who referred to his psilocybin experience that day as his “cosmic rebirth.” For the remainder of his life, Smith wrote and spoke about the noetic quality of his mystical experience triggered by psilocybin. Emerging from the experience, he felt transformed and utterly convicted “that life really is a miracle, every moment of it, and that the only appropriate way to respond to the gift we have been given is to be mindful of that gift at every moment, and to be caring toward everyone we meet” (Horgan 2017). Smith reported a lifelong belief in and experiences of God, “[b]ut until the Good Friday Experiment, I had had no direct personal encounter with God of the sort that *bhakti yogis*, Pentecostals, and born-again Christians describe. The Good Friday

Experiment changed that, presumably because the service focused on God as incarnate in Christ” (Smith 2000, pp. 100–101).

Pahnke’s methodology included the creation of a phenomenological typology, largely based on W. T. Stace’s 1961 classic, *Mysticism and Philosophy*. Stace defined seven universal characteristics of mystical experience and set aside delineations of religion or religiousness. In Pahnke’s typology, he constructed nine categories: unity (internal and external), transcendence of time and space, deeply felt positive mood, sacredness, objectivity and reality, paradoxicality, alleged ineffability, transiency, and persisting positive changes in attitude and behavior (Pahnke 1966).

Smith described how participant accounts were gathered: “The day after the experiment we would write reports of our experiences, and Pahnke would have them scored by independent raters on a scale of from zero to three for the degree to which each subject’s experience included the seven traits of mystical experience [from Stace]. There was one borderline case, but apart from that, the experiences of those who received psilocybin were dramatically more mystical than those in the control group” (Smith 2000, p. 100). Pahnke included a 6-month follow-up questionnaire and interview as part of the experiment, which aimed to determine perceptions, positive or negative, of attitudinal or behavioral changes on the part of each participant.

Twenty-five years after the 1962 experiment, Rick Doblin conducted a “Long-Term Follow-Up and Methodological Critique,” published in *The Journal of Transpersonal Psychology* in 1991. Of the ten original volunteers who received psilocybin, seven (most of whom became ordained clergy) were eager to participate. Of the remaining three, one had since died, and one refused to be interviewed because of his misunderstanding of his pledge of confidentiality to Pahnke (who died in a scuba-diving accident in 1971). The story of the final participant, according to Huston Smith and Rick Doblin, reveals some grave omissions in Pahnke’s reporting of participant experience and methodology. The final participant, who Smith

anonymously references as “John,” had an extraordinarily negative experience, escaping the basement space and running onto Commonwealth Avenue. Smith, who first chased after John, reports that the participant was convinced that “God...had chosen him to announce to the world the dawning of the Messianic Age, a millennium of universal peace” and that he needed to reach the university dean so he might hold a press conference. Once John was sufficiently overpowered by Pahnke and his assistants and returned to the chapel, Pahnke injected Thorazine as a tranquilizer and antidote to John’s psychotic state. Though he participated in the 6-month follow-up (and reported only “slightly harmful” negative persisting effects), John refused to participate in Doblin’s 25th-year retrospective study and made clear that he had very negative feelings about the experience.

In addition to omitting his administration of Thorazine to a participant, it has been speculated that Pahnke may have minimized the reports of anxiety and other negative experiences from participant testimonials and questionnaire results. Nevertheless, Pahnke’s study made a significant contribution in demonstrating the potential of entheogens in triggering mystical experiences. It is noteworthy that despite reported difficult moments for the participants, all the subjects who participated in Doblin’s follow-up study were overwhelmingly positive and “reported a substantial amount of persisting positive effects and no significant long-term negative effects” 25 years later.

The Good Friday experiment continues to serve as a paradigmatic model of psychedelic research, though it was certainly not the only one. In the 1950s, following Albert Hofmann’s discovery of LSD, many European and American scholars and psychiatrists eagerly explored the clinical and existential potential for what might be a new “royal road to the unconscious.” In this period, more than a thousand clinical papers were produced, discussing more than 40,000 patients (Grinspoon and Bakalar 1979, p. 192) who were treated with LSD, psilocybin, and other psychedelics (also known as entheogens) for addiction, depression, autism, and schizophrenia.

After several decades of halted research, due to federal bans on psychedelic substances (even for research purposes), several aspects of the Good Friday experiment were successfully replicated (with more robust controls), and yielded similar results. Roland Griffiths, a leading researcher of drug-addiction and senior scholar in psychiatry and neuroscience, published in *Psychopharmacology* in 2006 the results of a landmark study, “Psilocybin can Occasion Mystical-Type Experiences Having Substantial and Sustained Personal Meaning and Spiritual Significance.” In Griffiths’ and related studies to follow, empirically-structured double-blind experiments were designed to prompt religious and mystical experiences for terminally ill patients experiencing “existential distress.” Results showed that 70% of research subjects named their single psilocybin-assisted therapy session as one of the five most meaningful experiences of their lives, and reported dramatic relief of previously reported distress.

The high drama of the Good Friday Experiment may be contrasted with scenes from psilocybin therapy sessions today at Johns Hopkins School of Medicine, New York University School of Medicine, and other institutions, which include a well-appointed room, decorated with books and art representing various myths and religious traditions, a comfortable couch-bed for participants, with headphones and an eye mask. On a table nearby is a ceramic chalice in which patients are given a single pill, either a placebo or dose of psilocybin. Two clinicians (usually male and female) often attend the participant for the entire 7-h session. It is a carefully curated, institutionally sanctioned experience, but from the reports of participants, the spiritual experiences are no less notable in their consistently transformative nature.

At the time of this publication, the Johns Hopkins School of Medicine was recruiting participants for a study entitled, “The Effects of Psilocybin-Facilitated Experience on the Psychology and Effectiveness of Religious Professionals,” in collaboration with New York University. Such trials are premised on the

hypothesis “that religious professionals, given their interests, training, and life experience, will be able to make nuanced discriminations of their psilocybin experiences, thus contributing to the scientific understanding of mystical-type experience” (Ross 2013). For scholars of the psychology of religion, this is a fascinating and important indication of innovative future research trajectories and methodologies.

Gorsuch, Richard L.

Ana Wong-McDonald
Los Angeles Christian Health Centers,
Los Angeles, CA, USA

A prominent researcher, speaker, author, and educator, Richard Lee Gorsuch (1937–2016) was best known for his work in the psychology of religion, statistics, and research methodology. He also published in social psychology, morality, personality, and substance abuse, as he believed that psychologists should have a broad knowledge base rather than being restricted to one area. He recognized that although specialization is needed, gaining sufficient general credentials keeps a specialty in perspective (Gorsuch 2002a). Born on May 14, 1937, in Wayne, Michigan, Gorsuch was a devout Christian, and his faith was the main catalyst for his life and career.

In 1959, he completed a Bachelor of Arts degree at Texas Christian University, with a major in psychology and a minor in religion. During his undergraduate years, Gorsuch served as a guest preacher in local churches. Though interested in religion, he followed his main academic advisors' advice to continue his studies in psychology. He went on to complete a Master of Arts in Psychology in 1962 and a Doctor of Philosophy in Personality, Social Psychology, and Sociology in 1965, both at the University of Illinois. Given his love for religious studies, he returned to school after his doctorate and completed a Master of Divinity (MDiv) at Vanderbilt University in 1968.

Generally, it was uncommon to return to school for another master's degree after attaining a doctorate. Gorsuch's decision to do so stemmed from his belief that for psychologists to truly be able to integrate spirituality with psychology, they would need training and experience, such as an MDiv degree followed by ordination and experience in ministry (Gorsuch 2002a). True to his principles, after completing an MDiv, he was ordained as a minister in the Disciples of Christ denomination in the same year.

During the mid-1960s, Gorsuch worked with Lawrence Kohlberg on the development of ethical and moral behavior and conducted research in Belize. Morality, values, and ethics were significant concerns to him. He went on to write over 20 articles in these areas. He also served as the Kennedy Chair for Ethical and Moral Development at George Peabody College for Teachers. He tied ethics and values to social science and philosophy in *The Nature of Man: A Social Psychological Perspective* (Gorsuch and Malony 1976). Moreover, in ministry work overseas, Gorsuch served on the Board of Directors for the Thai Christian Foundation. He stayed in a rural war zone with no electricity to teach stages of moral development to Burmese officers and helped the Shan generals in Burma to train military officers in ethical behavior.

During the civil rights movement, Gorsuch felt impassioned to take a moral stance. He participated in marches and demonstrations, including peaceful protests against restaurants that refused to serve African Americans. He turned down invitations to attend other prestigious divinity schools and chose to complete an MDiv at Vanderbilt, as the civil rights movement was burgeoning in Nashville. He joined the National Association for the Advancement of Colored People as a member. As a volunteer, he taught Bible classes at Fisk University and the American Baptist College to African American students who desired to enter the clergy.

Although Gorsuch did not hesitate from taking an ethical stance which might cause conflict, he preferred to "avoid conflict unless ethics and the

situation allow no other possibility.” He further advocated to “minimize [such] conflict if avoidance does not work” (Gorsuch 2002a). As a Christian, he sought to be a peacemaker. In 2005, he founded the ministry, *Group Conflict Resolution*, where he served over 16 churches and Christian organizations in mediating conflict.

During Gorsuch’s doctoral education, his major advisor was Raymond Cattell, who focused on measurement and factor analysis. Cattell’s training on factor-analytic procedures and their usefulness in theory building had a lasting impact on Gorsuch. During that era, psychology of religion was seen as superstitions of the past and rarely an accepted topic in psychology. Gorsuch speculated that its demise was due to the separation of psychology from philosophy. Religion came to be avoided by psychologists because of their desire to establish a separate identity from philosophy. He also reasoned that due to the predominance of atheists and agnostics within psychology, studies of religion were viewed as suspect (Gorsuch 1991).

To help establish psychology of religion as a legitimate field, Gorsuch believed that the methodology of psychology and sociology must be used such that its research articles would be virtually indistinguishable from those of other professional journals. To that end, he was one of two or three scholars to introduce scientific research methodology in the psychology of religion in the 1950s. He further advocated that research articles needed to be published in mainstream journals for greater visibility and to encourage psychologists to take religion seriously as a variable (Gorsuch 1991).

Gorsuch’s 1984 article “Measurement: The Boon and Bane of Investigating Religion,” was the first article in psychology of religion to appear in *American Psychologist*, the official publication of the American Psychological Association. In the article, he noted the development of psychometric scales in measuring religion. He observed that as questionnaires became the main method of inquiry, the measurement of religion had become the primary goal. He concluded that measurement should not be an end in itself but, rather, questionnaires need to relate to behaviors, and

measurement should lead to the study of religious phenomena.

Due to his expertise, Gorsuch was invited to write the section on the psychology of religion for the 1988 *Annual Review of Psychology* (Gorsuch 1988). This was the first time that such a section was included in the *Annual Review* since the early twentieth century. As a prolific researcher in the psychology of religion, he wrote and contributed to over 20 volumes and 130 professional articles, among which are the following: “Religious Aspects of Substance Abuse and Recovery” (Gorsuch 1995), “Moral Obligation and Attitudes: Their Relation to Behavioral Intentions” (Gorsuch and Ortberg 1983), “Attributions of Responsibility to God: A Function of Religious Beliefs” (Gorsuch and Smith 1983), and “Trait Anxiety and Intrinsic-Extrinsic Religiousness” (Baker and Gorsuch 1982; Malony 1991).

Another area of concern to Gorsuch was the application of multivariate models and factor analysis with less understanding than they merited. To remedy the situation, he wrote two editions of what became classic texts in factor analysis (Gorsuch 1974, 1983). In another effort to contribute to statistical understanding and greater comprehension of newer models, he developed the UniMult system, a statistical software, which became a commercial venture with himself as the Chief Executive Officer (Gorsuch 1990–1999). His expertise was widely recognized and he was invited to join the Society for Multivariate Experimental Psychology, which limited its elected members to 60 worldwide. He was the consulting editor for professional journals, including *Educational and Psychological Measurement* and *Multivariate Behavioral Research*. He was named as a Fellow in the American Psychological Association (APA) and the Society for the Scientific Study of Religion. The Cambridge International Biographical Center publication listed him among the 2000 “Outstanding Scholars of the 21st Century” (Hood et al. 2016; Spilka 2016).

Gorsuch presented innumerable papers, symposia, and addresses at professional conferences, and was the president of APA, Division 36, Society for the Psychology of Religion and Spirituality, where he was given the prestigious William James Award. He served as the editor for the

Journal for the Scientific Study of Religion and consulting editor for the *Review of Religious Research*. He was a coauthor of three volumes of *The Psychology of Religion: An Empirical Approach* (Hood et al. 1996; Spilka and Gorsuch 1985; Spilka et al. 2003), the foremost texts on the subject. Contributing to the discourse on the integration of religion, spirituality, and psychology, he wrote *Integrating Psychology and Spirituality?* (Gorsuch 2002a), where he invited readers to use the Bible in guiding integration.

Gorsuch defined integration as bringing psychology and religion together to bear on the same issues, such that decisions about those issues reflect the contributions of both disciplines. Integration occurs when psychology and religion are simultaneously in dialogue in addressing a question. He described two types of integration. The first type occurs at the interdisciplinary interface and is concerned with commentary of one discipline on the other. For example, religion may comment on the limits of psychology in discussing the existence of evil, and psychology may reflect on the frequent implementation of religious programs without testing first for negative side effects. The second type of integration occurs when both disciplines join together to solve a problem, such as the 12-step model of relying on a “higher power” (Gorsuch 2002a).

His model for the search for truth is summarized in his 2002 article, “The Pyramids of Sciences and of Humanities: Implications for the Search for Religious ‘Truth,’” where he explained that science provides nomothetic truth based on replication, while humanities and revelation provide idiographic truth based on unique experiences. He maintained that the two forms of truth are different but complementary as depicted in Table 1.

Both types of truth seeking begin with personal experience, though their paths differ. For the nomothetic, it becomes the search for consistencies as one’s own experience replicates what others report. For the idiographic, personal experience provides truth because it contains reasonably accurate knowledge of individualized events. Although the paradigms for knowing are fundamentally different in the two domains, they can dialogue with and complement each other. For

Gorsuch, Richard L., Table 1 The double pyramid model of disciplines

Science	Humanities
Nomothetic	Idiographic
Philosophy and theology	
Sociology	Politics
Psychology	History
Biology	Biography
Chemistry	Literature
Physics	Arts
Personal experience	
Nomothetic replication	Idiographic events

example, medicine, clinical psychology, and applied Christian ethics draw from both paradigms. Medicine brings biological data into the idiographic case, and clinical psychology applies psychological knowledge to the individual. Christian ethics applies the moral principles from God’s acts in history to individuals and society with relevant psychological and sociological knowledge. The dual pyramid model provides “bases of beliefs in truths in the sciences, including psychology, and in the humanities, including religion” (Gorsuch 2002b).

To Gorsuch, psychology was fascinating as a science, but his religious faith gave it meaning and broadened it. He saw integration between the two as a life-long task that lies at the heart of a scientist who maximizes one’s impact on the discipline for good, at the heart of a therapist who helps others, and at the heart of being an effective human being (Gorsuch 2002a). After serving on faculty at Vanderbilt University, George Peabody College for Teachers, Texas Christian University, and University of Texas at Arlington for over a decade, the passion for integrating psychology with religious faith brought him to the position of Professor of Psychology at Fuller Theological Seminary in 1979, where he was invited to develop and teach the integration of psychology and religion.

At the time of his death on February 14, 2016, he was a Senior Professor of Psychology and the Director of Research at The School of Psychology, Fuller Seminary. He taught research methodology, the psychology of religion, social psychology, and statistics for nearly four decades there. Beyond his professional accomplishments,

Gorsuch was a beloved educator and colleague. Together with his wife, Sylvia, they hosted Fuller students at their home for quarterly socials and discussions. They raised a son, Eric, a daughter, Kay, and three foster children. He was a generous mentor to all, and a champion for resolving conflicts in the local congregations and abroad. Among his many accolades, he was given the peer-chosen Weyerhaeuser Award for Excellence, the highest honor bestowed on a Fuller faculty member. As a researcher, statistician, journal editor, symposium speaker, educator, pastor, and mentor, he was a leading authority in his areas of expertise, and his contributions to the field of the psychology of religion cannot be overestimated.

Grace

Krystyna Sanderson

The Blanton-Peale Institute, New York, NY, USA

Grace seems to be a particularly Christian concept. The Incarnation itself is commonly referred to in Christian writing as an act of God’s grace. “For the law was given through Moses; grace and truth came through Jesus Christ” (John 1:17). Grace as an element of Christian faith denotes God’s unmerited favor toward all people and, though a free gift with “no strings attached,” is often linked with the human will to do good and seen as the means by which a person is

empowered to make right choices. There is however no coercion in grace: it may be accepted or rejected by the one on whom it is bestowed.

In St. Paul's commentaries on faith, the necessary exertions of the will are displaced from seeking to keep the law to accepting, through grace, the salvation that is freely given by God: "For by grace you have been saved through faith; and this is not your own doing, it is the gift of God – not because of works, lest any man should boast" (Eph. 2:8–9).

In psychological terms, grace can be seen to be the matrix within which healing energies can pass between psychotherapist and patient. It is grace that allows the patient to safely express any and all life experiences with the assurance that they will be accepted and not harshly judged. It is also grace that enables the therapist to maintain professional detachment and not become destructively involved with the patient when the patient emotionally attacks, challenges, and tests the psychotherapist in the course of transference.

Great Mother

David Waldron

Department of Social Science and the Humanities,
University of Ballarat, Ballarat, VIC, Australia

The Great Mother Archetype

From a psychoanalytical perspective, the Great Mother is the archetypal manifestation of the collective cultural experience of childhood

development. More specifically, the influences exerted on children are not so much the product of the mother herself, as an individual, but rather the product of the archetypal mother image rooted in the collective unconscious. As such, the image of the Great Mother reflects both the feelings of maternal support, comfort, and love for a child and the negative capricious experience of vulnerability, helplessness, and dependence experienced by the child in development. In this sense, the archetypal image of the mother is nurturing and loving but also capricious, mysterious, and linked to feelings of vulnerability and seduction (Jung 1968).

Thus, there is an intrinsic duality to the archetypal representation of the Great Mother. The imago of the divine feminine is paradoxical, serving as an archetypal manifestation in the collective unconscious but also, precisely because of the power of the symbol in the human psyche, as the focal point of a vast array of projections from both men and women. The Great Mother is seductive and capricious, virginal and pure, mothering and supportive yet mysterious and cruel. Jung commented on this sense of a fractured and split symbolic configuration of the Great Mother, observing that such splits are common in powerful symbolic representations and furthermore that as a fundamental part of childhood development, a child has to come to terms with their biological mother as a fully formed human being and reconcile these contradictory perceptions within the infant–mother dyad if they are to fully develop into psychological adulthood and relate to their mother as an individual rather than as a symbol. Closely linked to this experience of reconciling divergent symbolic forms associated with the archetype of the Great Mother is Jung's hypothesis that the Great Mother is experienced differently by males and females. Jung argued that the intrinsic alien qualities of femininity to a masculine psyche would lead to the representation of the Great Mother being more deeply impressed in the unconscious aspects of the psyche of a male and thus would exert a far deeper influence. Similarly, the feminine experience of the Great Mother is far more closely linked to a woman's conscious representation of the self and thus exerts less of a hold on the unconscious (Jung 1968).

It is this sense that the symbolic manifestation of the Great Mother in the form of Mother Goddesses is perhaps the most illuminating. The breadth and depth of Mother Goddess representations and worship through history and across cultures is remarkable. Mother Goddesses, as the symbolic manifestation of the Great Mother archetype, are associated with all major aspects of life such as death, birth, initiation, fertility, agriculture, warfare reproduction, and wisdom. Indeed, the sheer diversity of Mother Goddess representations closely aligns itself with Jung's paradoxical union of opposites intrinsic to the Great Mother archetype (Jung 1968).

The Great Mother in Goddess Worship

While a full discussion of the manifestation of Goddess worship or deification of the archetypal Great Mother and the complex and often controversial claims surrounding claims of Neolithic widespread Goddess worship is beyond the scope of this article, it is worth noting some common themes that resonate throughout cultural patterns of deification or sacralization of the Great Mother archetype. Sacred images of the Great Mother archetype range through the vast proliferation of the Goddesses of antiquity and contemporary Hinduism to the sacralization of the Virgin Mary in many catholic traditions to the Gnostic veneration of Sophia. Despite this proliferation, there are certain common themes and distinctions in the way the feminine imago is manifested. Typically, these themes also reflect the varied and diverse associations of a reified femininity as experienced in cultural life (James 1983).

The Great Mother and the Holy Virgin

The manifestation of the Great Mother is commonly associated with virginity. Perhaps, some of the most visible representations of this model of reified feminine sacrality are the iconic figure of the Virgin Mary in Catholicism and the Hindu Goddess Kannagi who is goddess of both chastity

and the sacredness of motherhood. Similarly, Mother Goddesses are typically associated with nurturing, protection, and healing. Overtly, this relates to the aforementioned experience of childhood and infancy combined with the socially ascribed role given to women in most cultures. However, it also relates to anthropological notions of pollution and taboo through which the purity associated with motherhood or the sacred virgin serves to purge people of corruption and contamination. Goddesses in general tend to be attributed with nurturing qualities serving as the symbolic wellspring of life. Similarly, images of the sacred feminine are commonly constructed in local mythologies as wives and consorts of gods, also linking the role of the Great Mother with established social structure and practice. Conversely, the Great Mother is also commonly associated with violence and destructive power; as illustrated by the triple aspected Morrigan of Celtic folklore, the Balinese Goddess Rangda and the Hindu Goddess, Kali. These Goddesses, while having nurturing and loving sides to their personas, are commonly represented as capricious, destructive, and cruel. This pattern closely reflects Jung's notion of the Great Mother as represented archetypally in religious forms, having a distinct duality which reflects the sense of helplessness and vulnerability experienced by infants in development and growth.

The Great Mother and the Earth Goddess

Goddesses are also commonly linked with the earth and with natural phenomena. A contemporary manifestation of this is the Earth Goddess of many neo-pagan traditions or James Lovelock's Gaia hypothesis. Developing in the nineteenth century, this notion of a universal Mother Goddess linked to the earth has become widespread in western culture (Hutton 1999). However, while Earth Mother goddesses are very common, there are numerous exceptions to this rule of feminine Mother Goddess and earth association. For example, Egyptian goddesses are rarely Earth Mothers; indeed, Sky Goddesses and Earth Gods are more common, as in the Japanese

Shinto tradition. The Venus figures found by archaeologists in the Neolithic period are often taken to represent a universal monotheistic Earth Mother religion preceding a later degeneration to patriarchal religious traditions. However, while there is evidence for this, the Paleolithic Earth Goddess hypothesis has come under severe historical critique due to the often indiscriminate manner in which various symbols were uncritically configured as intrinsically representative of an Earth Goddess while contemporary use of similar figures by indigenous peoples rarely corresponded with the Great Goddess hypothesis. That being said, many of these images and artworks clearly relate to examples of ritual use of feminine images and artwork and indicate the importance given to the sacred feminine in the ancient world (Gimbutas 1982; Hutton 1993).

The Great Mother as a Religious Manifestation

The Great Mother as a religious manifestation is demonstrated throughout history and across cultures and continues to undergo renewal and redevelopment within many new and well-established religious movements. The Mother Goddess image has played an incredibly important role in prehistory, throughout the development of agriculture and contemporary civilization and in urban life, and continues to play a significant role in all religions and cultures. Nevertheless, it is important to evaluate the significance and symbolic import of these representations within the context of the culture and society in which they operate. It is also worth noting that, from a Jungian perspective, while the Great Mother serves as the archetypal source for a host of religious representations, it is not the same as the deified images of femininity and motherhood that exist across cultures. For Jung, the fundamental nature of the mother–child dyad meant that the Great Mother as an archetype would be a universal symbol within the collective unconscious. However, this is a far cry from reifying the cultural manifestations as existent manifestations of a universal deity (Jung 1968).

Green Man

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

The Green Man (Fig. 1) is an ancient depiction of the foliate face of a man, woman, or animal with vegetative growth around the face or sprouting from the mouth. He is a personification of the transcendent power behind the growth of life and the psychology of human desire to reproduce. He was an archetypal pre-Christian vegetation god image that was then accepted in church architecture for centuries. He appears in many countries, in thousands of churches and pub names, as well as in dances, such as the English Morris Dancers, where he is a man dancing around, totally covered with leaves, chasing girls, similar to “Jack in the Green.” This expresses his embodiment of the joyous natural psychological desire to reproduce. He is often part of a dying and rising ritual,

Green Man, Fig. 1 Photo courtesy of the author; molding of original church art by oakapple designs.co.uk

expressing his personification of the winter disappearance of many plants and the spring reappearance of plants and births of new animals. He is prominent in Europe, especially in Ireland and England, in medieval churches and cathedrals, sometimes also as a woman or animal. For example, several Green Men with bright golden leaves were carved on the pulpit of Elisabethkirche in Marburg, Germany, around 1340 (Anderson 1990, p. 64).

The Green Man is a masklike version of the spirit of many ancient vegetation gods, such as Osiris, Dionysos, Tammuz, Adonis, Attis, and Cernunnos, when he was related to the Great Goddess as lover and, as a divine power of life in plants and animals, is her reborn or resurrected son (Anderson 1990, p. 21). In the days when agriculture was understood as a gift from the divine, the Green Man was thanked for the crops. When life was more subject to disease and death, people psychologically felt more reverence and thanks for the Green Man as an image of sustenance. In pre-Christian Europe, trees and groves were commonly the focus of sacred presence, and the head was also venerated as a locus of soul. Yew trees, for example, have long been felt as sacred in Ireland and the United Kingdom.

Many remain today in churchyards and cemeteries. In the USA one can feel that sacred presence in the giant redwood and Sequoia forests in California.

The Green Man was a figure in many legends, in rowdy adventures with Jack and romances with girls (Anderson 1990, p. 10ff). The Green Knight was humanized in the medieval Arthurian romantic legend *Sir Gawaine and the Green Knight* (Armitage 2007). Green Man songs and poems include clear identification with both plants and human love:

Like antler, like veins in the brain the birches
Mark patterns of mind on the red winter sky;
'I am thought of all plants,' says the Green Man,
'I am thought of all plants,' says he.

...

The alders are rattling as though ready for battle
Guarding the grove where she waits for her lover;
'I burn with desire,' says the Green Man,
'I burn with desire,' says he. (Anderson 1990, p. 12)

The power of reproduction present in plants, animals, and sexual desire was symbolized by this age-old Green Man, burning with desire to reproduce and keep life going. Ultimately, reproduction is deeper than biology, desire deeper than psychological instinct. It is also a sacred wonder, a "greenness" emerging from the ultimate reality that keeps life going on this planet. This image is a deep archetypal image that is transferable to other cultures and religions. The Hebrew Tree of Life is central to the Garden of Eden (Genesis 2:9). Jesus used a vegetative image, saying "I am the true vine. . ." (John 15:1). The medieval nun Hildegard von Bingen emphasizes the image of *viriditas* – "greenness" in her creation spirituality, God's creative power appearing in nature. She called Jesus "Greenness Incarnate" (Metzner 1999, p. 140).

From the Renaissance onward, the Green Man continued to appear in stained glass, manuscripts, and metalwork. But as the separation between humans and nature grew in the age of science, the Green Man faded from consciousness. However, he was revived in the nineteenth-century Arts and Crafts movement. The Green Man then appeared in contemporary times in

many artists' works (Araneo 2006). In 1939 Lady Raglan stirred his reawakening with her anthropological study. Many international and current appearances of this enduring vital life-energy figure have been documented (Green Man). In Kenya, Wangari Maathai, Ph.D. (1940–2011), embodied the “Green Woman” spirit. She founded the Green Belt Movement, focused on planting trees, environmental conservation, and women's rights. For this, in 2004 she became the first African woman to win the Nobel Peace Prize. The Green Man [and Woman] point through the power of plant and animal growth, down to their ontological roots. He/she can transform the psychology of desire to a deeper, much broader sense of the sacredness of reproduction. The “Green” image is now gaining a renewed power, expressing the depth of the ecological psyche in its struggle against industrial pollution.

Grief Counseling

Joan Berzoff

End-of-Life Care Certificate Program, Smith College SSW, Northampton, MA, USA

This entry begins with some of the theorists who guide grief and bereavement counseling. It then considers cross-cultural and spiritual issues in grief and bereavement. Next, it examines two modalities of grief practice, individual and group, as well as the core skills necessary for grief counseling. Finally, it raises the current controversy about the diagnosis of prolonged grief, now under consideration for the DSM-V.

Freud

Freud was one of the first to conceptualize the differences between healthy and complicated bereavement. In “Mourning and Melancholia” (1917), he wrote that grief was not itself a pathological state although it often feels that way. All grievers feel dejected, exhausted, and depleted. They are preoccupied with the lost person and withdraw their energy from the outside world while intensely holding onto memories of the deceased. They do not relinquish those memories easily, as no one ever abandons love willingly. But with time and reality checks, mourners begin to redirect their intense energy back to the world in order to love and live again. How does this occur? Through identifying with aspects of the lost person, Freud wrote that the “shadow of the object falls upon the ego,” speaking to how loss shapes the mourner's self in new ways (Freud 1917, p. 249). Thus, mourning can be seen as potentially changing the mourner's identity and even ideals (Loewald 1962).

But Freud (1917) added another dimension to grief, which he called *melancholia*, and which others have called complicated or prolonged grief. In Freud's view, when there has been a conflicted relationship with a person who has

died, unconscious anger toward that person is directed at the self, leading to a loss of self-esteem, self-criticism, self-blame, worthlessness, loss of appetite or sleep, and, in its worst, suicidality. Pathological grief does not end. It is debilitating to internalize an unresolved and conflicted relationship and difficult to treat, due to its unconscious and denied roots.

Children

Bowlby (1969, 1973, 1980) added to the discourse in his study of children's grief. He studied children who had been separated from their mothers. The babies he observed in hospitals first protested with much wailing and screaming. When that failed to restore their mothers, children wept, pined, searched, and yearned for them. When their mothers still failed to return, some infants became detached, denying their needs for emotional attachment altogether. He theorized that grieving children experience four potentially painful stages of grief including numbing, yearning and searching, disorganization, and despair. But he added the fifth stage of reorganization, suggesting the importance of resilience and the capacity to adapt to loss that many children and adults have.

Adaptation

Lindemann (1944) also defined normal and pathological grief as varying forms of adaptation. Studying those who lost loved ones in the Coconut Grove fire in Boston, Mass., he saw grief as always including physiological symptoms, preoccupations with images of the deceased, feelings related to not having done enough for the deceased, and anger at other professionals for not having saved the deceased. He saw pathological grief as symptoms resulting from unconsciously incorporating the lost person, overactivity, manic behavior, marked hostility, or self-destructiveness. He noted the value of being

able to anticipate a loss in order to prepare for and cope with it.

Kubler-Ross

While Bowlby (1969, 1973, 1980) and Lindemann (1944) suggested specific stages of grief, Kubler-Ross (1969) was even more specific in delineating specific stages of grief, seeing griever moving through linear sequences. First, mourners denied the loss; next, they felt anger, and then they tried to bargain. Next, they experienced depression and finally they moved into acceptance. In fact, we now know that no one actually grieves in such linear ways. Stroebe and Shut (1999) note that grief is always a dual process. Loss is never static but moves back and forth between expressing grief and living life.

Positive Aspects

Many contemporary grief theorists (Baker 2001; Bonnano 2004; Stroebe and Shut 1999; Worden 2009) therefore emphasize some of the positive aspects of grief. For example, most current grief theorists report that mourners never relinquish their ties to the dead, but maintain continuing bonds with those who have died; their relationships continuing to grow despite the loss. Further, loss and even traumatic loss can be occasions for growth. Calhoun and Tedeschi (2006) note that after a traumatic loss such as in combat or after tragedies such as 9/11 and in natural disasters, mourners create new meanings, even monuments, to those who have suffered, often fighting on their behalf, so others suffer less.

This view of grief sees mourners not as passive recipients of loss but as active participants in their grief, creating new narratives and meaning (Neimeyer et al. 2011) and often making profound social and political changes as a result of the loss (Berzoff 2010). For example, mothers against drunk driving, or those who testified in Congress about lax security after 9/11, or the Susan Komen

Foundation offers us a few of so many everyday examples of how mourners use their grief experience to activate social and systemic change.

Postmodern Views

A more postmodern view also deconstructs the values embedded in Western theories of mourning. In many Western cultures, the emphasis on separation and autonomy leads to the view that grief can be worked through and resolved. But in many cultures, grief is not expressed verbally but through the body: a pain in the belly, or a “wind” in the heart (Corwin 1995). For some groups who have been oppressed, death may be experienced as emancipation from suffering. Many Native American, African Indian, and even White cultures encourage contacting the dead for counsel. Most cultures see the goal of mourning as maintaining a spiritual involvement with the dead. In Hindu cultures, sacrifice is often a part of bereavement, with offerings made from birth to death to ensure the dead’s entrance into Nirvana. There are also different expressions of feelings of bereavement. The Balinese are expected to project a happy and smooth outer appearance in mourning (Wikan 1990) while African Americans and Jews consider stoicism at funerals to be pathological (Imber-Black 1991).

Groups

How do these many ideas inform grief counseling? First, counseling not only occurs in individual work but in group work as well (Silverman 1986). Groups for the bereaved can destigmatize grief; they can be ways to share resources, offer social support to mourners, normalize tragedy (Sutton and Leichy 2004), and offer spiritual connection so that loss is linked to something greater than the self. Groups can include family loss groups, children’s groups, and bereavement-specific groups (i.e., widows, adolescents, or parents who have lost a child). For many in groups,

participation is a sign that recovery has begun to occur (Silverman 2000).

Individual Counseling

In individual counseling, the emphasis is on finding both meaning to existential suffering (Neimeyer 2002) and on maintaining enduring connection to the deceased in the midst of embarking on a new life (Worden 2009). While grief counseling may focus on understanding and dissolving more pathological bonds to the deceased (Freud 1917), another part of the work is in recognizing that there will always be waves and paroxysms of grief (Didion 2005). Grievers need to tell their stories and should be encouraged to do so: through bringing in pictures, blogs, and objects of the dead, since literal objects of the dead can connect the mourner to the deceased person (Berzoff 2004; Volkan 1981). Clients should be encouraged to tell their stories again and again, reconstructing the meaning of the person’s life and death. Grief counselors should always elicit cultural practices, rituals, and prayer, which provide solace and support. Clinicians should listen for the client’s belief system, meaning-making system, and spiritual connections.

Grief Counselors

What does the grief counselor need in order to do this work? First, self-knowledge and an open heart are essential (Farber et al. 2004). Grief counselors need to know how they have faced their own losses and mortality. They must hold a clinical stance of authenticity, respect, and the capacity for surprise (Berzoff and Silverman 2004). Grief counselors need to be able to bear witness, be present to, and to tolerate suffering without undue anxiety or fear (Cassell 1982). They need to be able to elicit multiple forms of legacy building that commemorate the dead. They need to be able to attend to each individual or family’s way of

expressing grief, and to be able to bear a range of feelings including anger, sadness, and hopelessness. They also need to be able to offer hope. Grief counselors need to recognize that there is no one right way to grieve and to be aware of the values, expectations, developmental stages, strengths, and ways of coping that each mourner has used in the past (Ferris et al. 2002).

This is not work for the faint of heart. Compassion fatigue is always a risk, and so clinicians must find forms of renewal in self-care, supervision, meditation, or exercise. Sometimes self-care comes from the satisfaction of helping another; sometimes it emerges through helping others change the environments in which their loved ones died (Berzoff and Silverman 2004).

Prolonged Grief

Currently, there is a debate over whether to make “prolonged grief” a diagnostic category. Prigerson et al. (2002) have conducted research for over a decade in support of this diagnosis that includes having trouble accepting death, death interfering with life, being bothered by intrusive images, avoiding uncomfortable previously enjoyed activities, and feeling cut off from others, for more than 6 months. While the potential value of such a diagnosis may be reimbursement for grief counseling, we must ask whether these criteria do not describe every mourner, healthy and pathological? Placing a time limit of 6 months on grieving may lead to stigmatizing, problematizing, and pathologizing mourning itself. The medicalization of grief may also undermine a bereaved person’s self-esteem and even encourage dependency on a grief counselor (Parkes 2011) when there may be no need for counseling given that grief is an inevitable part of the human experience.

Group Counseling

David C. Balderston
New York, NY, USA

Group counseling is a psychological method of helping people deal with certain problems in their emotions, behavior, and relationships by meeting together regularly with several others and a leader, to share their problems and receive emotional (and sometimes practical) help from each other.

Introduction

Group counseling is one of several different types of group methods that help people by having them meet together to talk about their problems. It is situated, in terms of form and function, somewhere between support groups, twelve-step programs, and gender focused groups on the one hand, and group therapy and group analysis on the other, plus larger extended-duration groups. All these methods provide powerful benefits to group members through the sharing of their own experiences and from hearing others speak about similar problems. This group process helps to reduce individuals' feelings of helplessness and isolation. Group counseling, more than the other types, may be provided by religiously affiliated institutions and leaders.

This entry will first summarize the different types of therapeutic and helping groups. Then it will describe counseling groups and the special nature of religiously oriented counseling.

Overview of Types of Groups for Healing, Emotional Support, and Personal Change

1. Twelve-step programs, and support groups for various, usually medical, conditions
2. Gender focused

3. Extended duration
4. Psychological: counseling and therapy; secular and religious

Twelve-step programs that deal with various forms of addictions, broadly defined, are modeled after the original one, Alcoholics Anonymous, which was started in 1935. They generally include an acknowledgment of a “higher power,” with its definition left entirely up to the individual, who could be an atheist.

Support groups now exist for sufferers of many different ailments, who share with each other the unique difficulties that each disease involves. Increasingly, the non-ill family caregivers are also encouraged to meet in their own support groups, lest they eventually develop caregiver “burnout,” or compassion fatigue.

Twelve-step meetings tend not to have professional leaders, while support groups do. In support groups, members are not encouraged to focus on each other’s personalities, but on providing sympathetic support for each other’s situations and feelings. In twelve-step programs, candid sharing of experiences is encouraged, but “cross talk,” i.e., commenting on each other, is discouraged.

Beginning in the 1960s, two specialized types of self-improvement groups have flourished: encounter groups, which met in extended duration “marathons” for long hours or a weekend, and then gender-based consciousness raising (C.R.) groups. Feminists gave each other mutual support by sharing their experiences of oppression and discrimination as women, and later men’s C.R. groups met for similar sharing and bonding. These C.R. groups were leaderless, but operated with commonly agreed upon guidelines to insure participation by all attendees and to prevent interruptions.

Encounter groups, also termed “large group awareness training” (LGAT), were part of the “human potential movement” centered at Esalen Institute in Big Sur, CA, which sponsored workshops 1962–2016 on various “New Age” interests. A more academically based National Training Labs provided “sensitivity training” in T-groups. Sometimes LGATs were sponsored by

religious organizations and might be called marathons, intensives, or retreats.

Group Counseling

Psychologically focused groups for counseling, therapy, or analysis are often offered by colleges and universities and may also be sponsored by religious organizations. To oversimplify, counseling focuses on problems, while therapy focuses on personalities. This tends to make counseling more short term, while therapy tends to take longer and tries to “go deeper.” But the distinction is sometimes blurred, and counseling and therapy may overlap in practice.

Group work (counseling and therapy) has grown remarkably during the twentieth century. Psychologists and social workers are frequently the trained leaders of groups, but the umbrella organization for all professional group leaders, the American Group Psychotherapy Assn., is more interdisciplinary and includes clergy.

In group counseling members are encouraged to react to each other with constructive comments, not hostile ones. As in all other group methods, confidentiality is the rule, so that members will feel safe about discussing sensitive personal matters without fear that they will be revealed outside the group. Personality quirks and defensive patterns in members’ interaction may be discussed, but the leader’s job is to make sure that this proceeds in a nonattacking way, with no one being so threatened that he or she falls silent or leaves the group. If falling in love with or being sexually attracted to another group member occurs, then the feelings of intimacy need to be verbalized and shared with the whole group, but not acted on. The purpose of group counseling is always: how can we help each other and how can we best understand each other.

Group therapy focuses more on members’ personalities and how they affect other members, including negative reactions – in the belief that accepting honest feedback is a necessary step in trying to change. In group analysis, personal change is attempted by going as deep as possible into buried memories and feelings and by

analyzing the emotional resistances that members have to making progress. Because more upsetting things get discussed in group therapy and analysis than in group counseling, members often spend not a few weeks or months, but several years attending group meetings. Socializing with other members outside of meetings is not considered helpful.

Group counseling may have a set number of sessions, or be “open ended,” with different members joining and leaving at different dates. The size of the group may be limited to six or eight or may be more than twice that size. Generally, members stay in their seats. The exception is in group psychodrama, which involves acting out some difficult situation with other group members playing parts in the person’s life.

In all types of groups, every member should speak at every meeting at least a little, so that regular participation will promote group solidarity and a greater willingness to share sensitive material. Staying silent is a way of avoiding dealing with one’s feelings and can lead to premature exiting from the group. Spontaneous participation is usually favored over “going around the room.” Occasionally someone will talk too much (“monopolizing” – for emotional reasons that are hidden behind their many words) unless the leader or a member interrupts and inquires.

While some eating and drinking may occur in twelve-step and support group meetings, it is generally not allowed in group therapy or analysis. Since any kind of oral gratification (eating or drinking) tends to reduce anxiety, it has the effect of making one’s problems seem less urgent to talk about. Group counseling tends to frown on more than a small amount of eating or drinking in the group session, because harsh feelings (similar to sibling rivalry) are stimulated when some members are consuming and others are not.

Group counseling is often offered to a suddenly distressed community, e.g., a college or a congregation, after a shooting, suicide, or other shocking event or emergency. When persons who have broken the law and are court-mandated to attend counseling, their predictable opposition may be softened, and real progress made, when they meet with other similar offenders in group

counseling. Group counseling is often offered in situations where financial limitations will not permit individual counseling. Sometimes groups have co-leaders, usually male and female, who through their own interactions provide a model of healthy relationships and mature communication for the group members to observe and react to, especially since the leaders may be perceived as parental substitutes.

Religion-Sponsored Counseling

When group counseling has a religious affiliation, then the resources of that religion are added to the usual processes of group sharing, support, and emotional exploration. Group meetings may include prayer, scripture reading, and discussion of how the great leaders of that religion might handle a difficulty. The leader will try to maintain a balance between religious and psychological emphases. Psychologically, the triad of basic considerations – feelings, thoughts, and behaviors – is always useful. Religiously affiliated counseling, whether individual or group, provides professional psychological help with the added guarantee that a troubled person’s religious faith will not be attacked, but respected. Thus, it offers “safe” counseling to faith holders who might otherwise not seek psychological help if it were offered by a secular (“godless”) provider.

To a religious person, certain feelings may be seen as contrary to religious living and in religiously affiliated counseling will receive special consideration, as will certain thoughts and behaviors. One sympathetic approach is as follows: some emotions seem to emerge into consciousness spontaneously and unbidden and hence they may be considered “natural,” reflecting the way we humans were made by God, with an inborn capacity to experience the full range of human emotions, and thus all feelings are basically God-given. But some feelings can still be very troubling, especially sexual, angry, or envious emotional reactions, as well as feelings of worthlessness, inferiority, and lack of hope. What does it mean when such “bad” feelings occur spontaneously? What is our God-given emotional

system trying to tell us? Here, the leader's training and presence is important, to provide religious sanction to explore and discuss all such troubling feelings, in a religious context that provides both an ethical standard and a compassionate environment that does not rush to judgment or rejection, but allows members the time and space to struggle for improvement. It is helpful to distinguish between the initial unbidden upsurge of a feeling, and then the temptation to dwell on it, creating a fantasy of forbidden behavior that one indulges in to prolong the pleasure. So it may be possible to sense when a "natural" feeling is becoming a sinful choice. Group members need to have the freedom to discuss such matters from different points of view, lest the meetings become occasions of religious indoctrination and no longer counseling.

The principle of individual differences, found in both psychology and religion (the individual soul), provides a useful perspective on the varying degrees of group members' tolerance for the emotional stress that is inevitable in group counseling. Some people can change faster than others, whose slower progress may elicit either sympathy or frustration from other group members. The well-trained leader will protect those who induce negative reactions in other members, responding sensitively to the emotional undercurrents in the room to prevent a destructive group reaction.

Concluding Remarks

In general, psychological counseling will aim to loosen the rigidities of either/or (good/bad) thinking and promote a greater acceptance of both/and thinking (which increases one's range of options for constructive choice and action). But whenever beliefs are deeply held, especially religious ones, the consideration of new viewpoints (not necessarily antireligious or unethical, but still unfamiliar) can be threatening, requiring a delicate and sometimes lengthy counseling process.

In conclusion, group counseling is a well-proven and widely used method of helping people with their problems by their meeting regularly

with a trained leader in small groups, where members discuss their difficulties and thereby gain emotional strength and clarity – while a religious dimension in the group can add spiritual help.

Guanyin

Minqin (敏) Wang (王)¹ and Lee W. Bailey²

¹College of Foreign Languages and International Studies, Hunan University, Changsha, China

²Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Guanyin is one of the most popular deities of East Asia. In China she is known as *Guanyin* (also Kuan Yin or Kwan Yin). She is a Bodhisattva also called *GuanShiYin* (观世音), *Guan Zi Zai* (观自在), or *GuangShiYin* (光世音), meaning "She who hears the voices in the world crying for help." Cantonese variations are *Kwoon Yam*, *Kwoon Sai Yam*, or *Kwoon Chi Choi*. In Japan she is known as *Kwannon Bosatsu* or *Kwannon Sama*, in Vietnam as *Quan Am*, and in Korea as *Kwan Seum Bosal*. In *Daoism*, *Guanyin* is called "Ci Hang Zhen Ren" (慈航真人) "Immortal of the Benevolent Ship," "*Guanyin Da Shi*" (观音大士), or

“*Ancient Buddha of the Southern Sea*” (南海古佛). The male Bodhisattva *Avalokiteshvara* was brought from India to China, and his name was translated to the Chinese as *Guanyin*. Then it was slowly blended with uniquely indigenous Chinese elements. Although often oversimplified as simply an emanation of *Avalokiteshvara*, *Guanyin* is actually a uniquely Chinese goddess who synthesizes Buddhist, Daoist, Confucian, and indigenous shamanic elements.

History

Buddhism was first introduced to China during the Han Dynasty (206–220 CE), and *Guanyin* soon appeared as a male Chinese version of *Avalokiteshvara* in art as a monk with a thin mustache. Then, over the next several centuries, *Guanyin* was widely transformed into a woman. As early as 483–493 CE, an emperor had a vision of a feminine *Guanyin* (Stein 1986, p. 23). This presents a problem: some scholars cannot explain why the masculine changed into the extremely popular feminine *Guanyin* in China. This feminine transformation must have come from somewhere with good reasons. The answer has historical grounds and psychological, social, and spiritual reasons among the people who made her so popular. Of all the imported Buddhist deities, *Guanyin* was the only one to become a genuine Chinese figure. Many Chinese are not even aware of her Buddhist roots (Yu 2001, p. 223).

Although *Guanyin* is now commonly regarded as a female deity, she may still appear as a man or a woman. For example, the current Dalai Lama is said to be an incarnation of *Guanyin*. In Buddhism today, when a person becomes enlightened, they may become a Buddha, no matter whether the person is a man or woman. Similarly, when a Buddhist swears to serve people heart and soul without any selfish desires, the person becomes a Bodhisattva, regardless of their gender, because ultimately the Buddha mind is beyond gender, although humans connect to the transcendent strongly through gender characteristics.

One historical reason for her popularity is that during the fourth through the sixth centuries, invaders from the north (“*caitiffs*”) invaded China and forced the government south into the Yangtze River valley. Amid this chaos, when traditional Confucianism struggled to maintain order and civility, people likely welcomed the warm, compassionate, saving spirit of *Guanyin*, who was portrayed as responding immediately to sincere cries for help from people in desperate situations. *Guanyin* miracle tales spread, telling of her saving people from warriors, drowning, sickness, and infertility, often stressing a conversion experience (Campy 1996).

Psychologically and socially, *Guanyin*’s modern Buddhist egalitarianism goes against the ancient Confucian views of women as inferior, even polluted. Chinese goddesses helped remove women’s supposed pollution related to reproduction. Their followers might seek purity by resisting marriage, not consummating their marriage, living in celibate women’s communities, or providing their husbands with a concubine. Belief in goddesses still supports mothers and sisters who want to reduce family conflicts, such as paternal domination. The more inclusive goddesses also help unite various village territorial groups (Sangren 1983, pp. 11–17). These important social and psychological functions of goddesses like *Guanyin* give many women a countercultural social group and goals outside family.

Spirituality

The Buddha told Inexhaustible Intention Bodhisattva, “Good man, if any of the limitless hundreds of thousands of myriads of *Kotis* of living beings who are undergoing all kinds of suffering hear of Guanshiyin Bodhisattva and recite his name single-mindedly, Guanshiyin Bodhisattva will immediately hear their voices and rescue them” (Kuo-lin 1977). This is different from the traditions emphasizing study or meditation. This also goes against the ancient hierarchical traditions of Asia, in which the high gods were allied primarily with royalty. While celestial, *Guanyin* is

also very close to people. *Guanyin* and the Bodhisattva *Da Shi Zhi* (大勢至) are two important assistants of Amita Buddha. The three are called “Three Saints in the Western Paradise.”

For Chinese Buddhists, Buddhas and Bodhisattvas do not only exist in the spiritual world. Nor are they just the statues in the temples or pictures in the altars. Some old gods were deified government officials exercising imperial territorial rule. But Buddhist deities are universal and “present” among the common people in daily life and emphasize individual salvation. But unlike some Buddhist practices that suppress the senses, *Guanyin* is more Tantric, appearing in sensation, sight, touch, hearing, and fragrances. *Guanyin* was the first Chinese deity to leave heaven and appear with saving powers when people were in crisis (Campany 1996, p. 256) (Fig. 1).

Buddhas and Bodhisattvas have many forms, including appearing as common people, giving spiritual guidance, and performing miracles

(including resurrections) (Yu 2001, pp. 190–191). Accounts of miracles and divine wonders were well known in China before *Guanyin*, but many of hers contained the new Buddhist psychological emphasis on conversion to a new Buddhist life. The first known compiler of eyewitness accounts of *Guanyin* miracles was Fu Liang (374–426).

Iconography

Guanyin is said to have 32 forms. Some of these were imported with *Avalokiteshvara* (such as the thousand-armed image), and some were indigenous Chinese images (such as giving a child):

1. The oldest known indigenous Chinese image is of the “Water Moon *Guan Yin*,” white-robed with a large moon halo (Yu 2001, p. 184).
2. *Guanyin* holding a willow branch and a narrow vase of her “sweet dew” of compassion and healing.
3. *Guanyin* with a fish basket, indicating *Guanyin* saving people in ocean storms (and in life).
4. *Guanyin* with a lotus flower (a traditional Indian image of beautiful new life on water, growing from mud [life’s messes] yet remaining pure) indicating that she always helps people to become enlightened.
5. *Guanyin* in white (pure) clothes, indicating *Guanyin* going to the secular world to help people.
6. *Guanyin* in red clothes, indicating *Guanyin* staying in the temples to help people.
7. *Guanyin* with four arms or eleven faces on her crown or one thousand hands and eyes, indicating her many powers (a traditional Indian image).
8. *Guanyin* standing on a dragon (a traditional Chinese image), indicating her great powers to redeem sea animals.
9. *Guanyin* with a horse’s head, indicating her going to the animal world to redeem animals.
10. *Guanyin* with a child, indicating her sending children to infertile women.

Guanyin, Fig. 1 Retrieved from “Forum/bbs” at <http://qiankunzhiyi.aa.topzj.com/forum-3926-1.html>

11. *Guanyin* seated in the casual “Royal Ease” pose, with legs apart and one arm resting on a knee raised high (like Hindu royal images).

But *Guanyin*’s forms are countless. That is why there is a saying “If you be humble and modest, you will meet *Guanyin* everywhere.” You can see *Guanyin* even in an oyster. In ancient times, there was a king who was very cruel and killed a lot of people and animals. He liked to eat oysters very much. In order to persuade him to love others, *Guanyin* made his/her image into all the oysters he got. So when he opened every oyster, he found the image of *Guanyin*. Then his Buddha nature was evoked and he realized *Guanyin*’s intention, so later he became a very good king.

Festivals and Pilgrimages

There are three annual *Guanyin* festivals. In the Chinese lunar calendar, February 19th is *Guanyin*’s birthday, June 19th is her day of receiving *Dao* (becoming enlightened), and September 19th is her day of achieving *Dao* (having the ability to apply the *Dao* perfectly to help others). Celebrations are held in each temple, and monks or nuns lead ceremonies such as singing “Praising Incense,” reading the names of many Buddhas, reading “Da Bei Zhou” (大悲咒) (Mantra of Great Sympathy), singing “Praising of *Guanyin Da Shi*,” reading “Poems of Bodhisattva *Guanyin*,” and returning the benefits of prayers to Buddhas and Bodhisattvas and to parents, children, relatives, friends, and even one’s enemies in previous and present lives. *Guanyin*’s Ritual of Repentance and Forgiveness is also popular (Yu 2001, pp. 263–265).

Guanyin’s *Dao Chang* (道场) (main place of spreading the *Dao*) is on *Pu-tuo* mountain in Ningbo, Zhejiang province, in the bay south of Shanghai. *Pu-Tuo* was a Daoist haven from the first century BCE Han period. It has been destroyed by wars and pirates and rebuilt repeatedly. It became Buddhist by the eleventh century. It is a busy pilgrimage island where people seek blessings and visions at temples, monasteries, rocks, and caves full of surging waves. It is one

of the traditional four major holy mountains in China. It is part of *Guanyin*’s connection to China’s South Sea, where miracle stories tell of her appearing in light or floating on a cloud to save drowning sailors.

Hang Zhou has also been a major *Guanyin* pilgrimage site. In 1987 an estimated two million pilgrims went there for her birthday. At such temples, pilgrims typically light incense and candles, chant and pray, burn spirit money to ancestors, and incubate dreams to be interpreted by monks. Pilgrims may beat on a hollow wooden “fish” and chant a *dharani* such as *Na Mo Da Ci Da Bei GuanShiYin Pu Sha* (Homage to the greatly compassionate, greatly merciful GuanShiYin Bodhisattva) (Blofeld 1977, p. 26).

Texts

There are numerous *Guanyin* texts, notably “The Universal Gateway,” which is the 25th chapter of the *Lotus Sutra*. The oldest version we have of this was translated by Dharmaraksa in 286 CE (Yu 2001, p. 161). Later it was translated from the Sanskrit into Chinese by Kumarajiva. It stresses how that people in need can call the name of *Guanyin* and they will be assisted immediately. It promises deliverance from swords, chains, demons, and bandits and offers sons to women who call out to her. There is some debate about her name’s translation from the Sanskrit to the Chinese, but this is traditionally the text where the name for *Avalokiteshvara* was translated to *GuanShiYin*, meaning “Lord who perceives the cries of the world.”

Early texts were found in a sealed cave at Dunhuang in northwestern China – wall paintings and banners of *Guanyin* saving people from distress, 1,048 copies of the *Lotus Sutra*, and almost 200 separate copies of the *Guanyin Sutra* (Campany 1996, p. 83). Another cave at Fangshan, near Beijing, revealed a treasure of hidden texts, stone slabs, and art about *Guanyin* (Yu 2001, p. 111). They showed that ancient kings often had *dharani* (invocations) carved on stone steles with sculptures, erected them around the country, and ordered monastics to memorize

and chant them, seated in front of a *Guanyin* image.

A very popular text is the Ming Dynasty (1368–1644) novel called *The Journey to the West*. This long, multivolume, historically based legend blends a Buddhist picture of *Guanyin* with indigenous Chinese local gods, Daoist *Xian* spirits, and various folklore scenes of dragons and monsters. The novel is based on the journey of the historical Tang (618–907) monk *Xuanzang*. His autobiography records a 17-year round-trip journey along the Silk Road from China to India to get the Dharma in sutras to take back to China. In the Ming novel he is called “Tripitaka,” which is an honorary title for a monk. The story was made into a popular 1979 Chinese television series. *Guanyin* plays a major role in the tale. First she is sent by the Buddha to China to find a suitable messenger to come and get the Dharma. She chooses Monkey (symbol of ego), who struggles on his way with various monsters (shadow beasts). *Guanyin* graciously appears and converts each one – Sandy, Pigsy, and Dragon – with forgiveness for their sins and their vows to behave and help along the journey. The highly allegorical and action-filled adventure shows *Guanyin*’s refined Buddhist theme of psychological conversion.

A famous ancient *Guanyin* text was inscribed on King Kao’s *Guan-Shih-Yin Sutra* stone votive stele (550–577), now in the Asian Art Museum in San Francisco (Yu 2001, p. 110). *Lu Kao’s More Records of Kuan-shih-yin’s Responsive Manifestations* (in Chinese) is a typical collection of miracle stories (Yu 2001, p. 579). A series of *Guanyin* poems are used in divination, such as this one telling of her role since the beginning:

From the beginning of Creation, everything had meaning:
The lucky day brings everything fruiting to ripeness...
Then revelation comes – and don’t take it lightly –.
The pure-hearted will be graced by the Divine One.
(Palmer et al. 1999).

Background

Guanyin’s background is multifaceted. The Buddhist tradition of the shift from a male to a female

divinity needs historical and psychological explanations. *Guanyin* traditions are clearly rooted in Buddhist goddesses such as Tara, archaic shamanic Chinese goddesses such as The Queen Mother of the West, and Daoist goddess such as *Ma Tzu*; in these historical roots and current practices are several psychological factors, such as women’s pollution relief.

The representations of *Guanyin* holding a child are rooted in the archetypal maternal desires expressed in China as early as archaic Neolithic (c. 500–2500 BCE) Chinese female figurines, called “fertility goddesses,” and temple ruins found in Mongolia, with female names on buried shamanic oracle bones and later bronze vessels. This feminine side of Chinese culture was absorbed into *Guanyin*, who is invoked to grant pregnancy and easy deliveries of both boys and girls (Yu 2001, pp. 127–140).

The popular legend of *Miao Shan* (“Wonderful Goodness”) had a powerful role in feminizing *Guanyin* (Yu 2001, p. 349). The oldest known account was carved on a stele in Honan in the eleventh century. With many variations and psychological implications, the story is that *Miao Shan* was a princess who refused her father’s command to marry (a refusal of filial piety, an Oedipal/Jocasta conflict, and a feminist assertion of Buddhist celibacy and archetypal purity). He pressured her and she retreated to a convent. He angrily burned it down and her spirit ascended above (transcendent function). Then her father fell ill (psychosomatic illness) and heard from her in disguise that the only medicine for him would come from a person who had never been angry (transformation of archetypal shadow). He sent for it and she returned him a medicine made of her arms and eyes, willingly sacrificed. When he healed and learned of her astonishing filial sacrifice (submission of ego to higher Self), he took the family to her and they all took refuge in the Buddha (submission of ego to higher Self). She was *Guanyin* in human form all along (presence of transcendent in daily life). The dominant themes of are conflicting: Buddhist celibate opposition to marriage; women’s resistance to traditional roles, yet Confucian filial piety; and her self-sacrifice to heal her father. Self-sacrifice

with a slice of flesh (*ke-ku*) to heal parents was a known practice in ancient China, although Confucians officially opposed it (Yu 2001, pp. 333–334). Pious Chinese were thereafter often named *Miao Shan* (Yu 2001, p. 303). Many Chinese deities are described like her, either as humans later deified or as deities in human disguise.

The image of *Guanyin* holding a fish basket is based on a legend also known as “Mr. Ma’s Wife.” In the Tang Dynasty (809 or 817), the story emerged that one day a lovely woman appeared in a village carrying a basket with a carp in it. She attracted many men’s marriage proposals. Her selection process was a contest – who could memorize the entire *Lotus Sutra* that she carried under the fish, in 3 days. Only a Mr. Ma could do it. But just before the wedding, she mysteriously died. They buried her and later a monk came and showed that her bones were linked by a golden chain, indicating that she was a great sage, and he carried her up to the sky, as in a resurrection. Many were converted to Buddhism and she was recognized as *Guanyin*.

The archaic Queen Mother of the West (*Xi Wang Mu*, 西王母), also known as the Eternal Mother (*Wu Sheng Shen Mu* 无生神母, *Yao Chi’ih*, *Wang Mu Niang Niang* 王母娘娘), is an ancient goddess who never appears on earth (thus remaining pure) and grants children. She was adopted by the Daoists and gives the gift of immortality and the secrets of eternal life. She is worshiped by both the elite and the masses. She was the most famous Chinese goddess before *Guanyin* and may well have been a model for *Guanyin* (Yu 2001, p. 480). She provides the best archaeological evidence of archaic goddesses – bone carvings from the Shang (1760–1122 BCE) (Despeux and Livia 2003, p. 25; Yu 2001, p. 409). During a drought in 3 BCE, she was worshiped by masses of people with straw manikins of her singing, dancing, and drumming around fires (Yu 2001, p. 410). She rules from the mythical Mt. Kunlun; she saves people and dispenses peaches of immortality, notably to emperors. Her cult involves ecstatic spirit possession. The Queen Mother is the essence of cosmic and bodily *Yin* and teaches

how to balance *Yin* and *Yang* in life, including sex, and thus live a long life and become enlightened (Despeux and Livia 2003, pp. 25–47).

An important Daoist goddess is *Ma Zu* (*Ma Tsu P’o*, *Mazipo*), a fisherman’s daughter from Fujian (Perkins 1999, pp. 319–320). She refused marriage and developed herself spirituality until she was able to project herself and influence nature. She used her powers to rescue her brothers and father, who almost drowned. She died early but continued to safeguard fishermen and traveling traders. She is also known for granting children and is very popular in Taiwan (Sangren 1983, p. 8). Integrated into the Daoist pantheon in the fifteenth century, she is still a popular deity in southern China. Like *Guanyin*, she remained celibate and made a vow to rescue all, and in her immortal form she responds to the sincere chanting of her name (Despeux and Livia 2003, p. 65).

Tara (“eye”), originally a Hindu goddess, in south Asian Buddhism is one of the primary emanations of *Avalokiteshvara*, born from his tears or a ray of light from his eye. The white *Tara* reveals her compassionate side. Whether called a Bodhisattva, Buddha, or deity, she is a savior who hears the cries of those suffering in *samsara*. Tara appears in art at the side of *Avalokiteshvara*, and *Tara* and *Guanyin* are also called “sisters of *Amitabha*” (Stein 1986, p. 35). The eye appears in *Guanyin* art also. John Blofeld sees *Tara*, who comes to the aid of needy mortals, and *Guanyin* as identical, although *Tara* is not well known in China (Blofeld 1977, pp. 53–64, 40–41). Many important themes from her predecessors were woven into *Guanyin*’s tradition.

Psychology

Exploring why *Guanyin* became feminine, we must look at traditional Chinese gender relations. Does *Guanyin* offer a psychologically tame balance for the ancient traditional role of women as subservient, portrayed in the saying “I was born a woman because of evil karma in a previous life” and the scornful relegation of women to an impure role in life due to their reproductive functions

(“The Blood Bowl Sutra” – 1194 CE)? Women were taught to detest their bodies and could only hope to escape Hell by being reborn as a man (male repression of shadow by projection onto women).

Or does *Guanyin* function as a more bold, compassionate, saving contrast to that repression, even a feminist opponent to that? The answer is that both themes are offered, as in the story of *Miao Shan*, who rebels against women’s subordinate position in marriage demanded by Confucian filial piety, by seeking to become a nun, but then sacrifices her own flesh to save her father, which shows loyalty to filial piety, as well as her Buddhist role as savior (Boucher 1999).

Daoism also views the feminine in an ambivalent way. It sees the *Yin* energy as a positive cosmic force in women but in contrast with a strongly patriarchal view of *Yang* from the Confucian tradition that suppresses women and sees them as polluted by their reproductive functions. The strong Confucian preference for a son to carry on the family name is a social denigration of girls not easily overcome by a Daoist balance of *Yin* and *Yang*.

Male-dominated Han Dynasty (206 BCE–220 CE) rulers and their formal heavenly gods pushed aside the goddesses and subordinated women, so, despite women’s stronger roles in Daoism and ancient traditions such as the Queen Mother of the West, their needs went largely unmet until they were filled by *Guanyin*. The personal and more inclusive needs of men and women of all classes were also met by *Guanyin* (Yu 2001, pp. 412–416). Goddesses cannot assure the political empowerment of women in a patriarchal society, but they can provide deep-seated spiritual guidance, comfort, and some amelioration of patriarchal authority. The Maoist revolution did free women from much ancient oppression, and now religions in China are expanding.

Avalokiteshvara is primarily a Bodhisattva of compassion and a cosmic savior from perils but was also commonly identified with royalty in Southeast Asia and Tibet. In imperial China the emperor was legitimized by the Confucian “Mandate of Heaven.” By contrast, *Guanyin* was not

identified with any kings or queens, although she does appear in a royal court in the novel *The Journey to the West*. People of all social classes, especially women, and even great sinners knew *Guanyin* more for her mercy and kindness. No one native Chinese goddess before *Guanyin* had all of her qualities (Yu 2001, p. 5).

Chinese spirituality is highly syncretic and unique and spread across East Asia. Sometimes people do not even realize that they are blending Buddhist meditation, Confucian filial piety, Daoist Yin-Yang exercises, and archaic ancestor or *Xian* worship. Therefore, it is not surprising the *Guanyin* is a syncretic blend.

Guanyin is a strong goddess who helps balance ancient patriarchal traditions, providing women with access to divine power, giving them pride (ego strength), and counteracting patriarchal assertions of pollution (shadow projection). She provides a more egalitarian alternative to Confucian hierarchical class traditions. She helps women wrestle with ancient Chinese versions of Freudian family dynamics (filial piety and conflict). She helps people of all parts of society transform their shadow archetypal patterns (monsters, tyrants) into higher spiritual devotions to the Buddha. She is a warm, maternal spirit of divine compassion.

Unlike remote divinities or sages who appeared long ago, *Guanyin* is very “present,” in methods of bringing the unconscious depths to the surface through ritual and spontaneous altered states – chanting, singing, fasting, dream interpretation, and visions. The numerous reports of her saving miracles continuing into the present show an active openness to numinous powers available at any time. This contrasts with the “disenchantment” of industrial societies that seeks to strip the world of transcendent wonder. Accounts of her conversions emphasize not just her overwhelming power, but people making decisions to change their lives, which in Western Jungian terms maintains free will as the divine savior archetypal image transforms the ego. *Guanyin* follows the ancient Asian Tantric pattern of Kundalini as she transforms the shadowy effects of the lower chakras by moving them upward, as in the “Monkey” conversions of dragons and monsters into

devoted seekers of the Dharma and in the lotus image. *Guanyin* is a widespread, uniquely Chinese goddess with a Buddhist core and background of Daoist and indigenous goddesses.

Gurdjieff, George

Sheldon Brown¹, Patricia Hemminger² and Jonathan Pepper³

¹Pleasantville, NY, USA

²Sparta, NJ, USA

³New York, NY, USA

A century has passed since George Ivanovich Gurdjieff, born in Armenia (1866–1949), offered an esoteric teaching based on knowledge and methods of “awakening” long forgotten in the West. His mystical teaching focused on self-awareness, as is shown by the title of his book *Life is Real Only Then, When ‘I Am’* (1999). The outer form and character of his teaching changed considerably during Gurdjieff’s lifetime in response to changing external conditions, to the needs and understandings of his pupils, and to make possible the continued transmission of his life’s work. The record of accounts by his pupils, the growing influence of his writings, and the living legacy of centers established throughout the world attest to the remarkable scale encompassed by his vision.

History

George Ivanovich Gurdjieff was born in Alexandropol (now Gyumri, Armenia) on the Russian side of the Russo-Turkish border, probably in 1866. We know of his early life from his own account in *Meetings with Remarkable Men* (Gurdjieff 1963/1975/1985). Gurdjieff was deeply influenced by his Greek father, an *ashokh* or storyteller with an encyclopedic knowledge of traditional songs and folklore, who exemplified

qualities of integrity, honesty, conscientiousness, impartiality, and inner detachment despite external misfortune. Gurdjieff was also influenced by his tutor, Dean Borsch, a member of the Russian Orthodox Church, who introduced him to such perennial questions as how to conceive of God, the nature of the soul, and the basis for objective morality. A third influence was the extraordinary paranormal phenomena that Gurdjieff witnessed as a boy, which neither his studies nor his teachers could explain.

As a young man, Gurdjieff moved to Tiflis (now Tbilisi, capital of Georgia, east of the Black Sea) and became an interpreter for the Transcaucasian Railway Company. His burning question became a search to understand the meaning and aim of existence. He expressed this as “an irrepressible striving to understand clearly the precise significance, in general, of the life processes on earth of all the outward forms of breathing creatures and, in particular, of the aim of human life in the light of this interpretation” (Gurdjieff 1933–1974). Convinced that transmission of forgotten knowledge must still occur, for more than 20 years, Gurdjieff embarked on wide-ranging journeys from North Africa and the Middle East to Tibet. These travels led to intimate acquaintance with schools of esoteric knowledge from sources including esoteric Christianity, Muslim Dervish orders, and Buddhism.

In 1912 Gurdjieff began to assemble pupils in Moscow and St. Petersburg and offered the comprehensive teaching that he had so painstakingly sought, drawing from diverse religious, philosophical, psychological, and cultural (folk wisdom) sources. He soon attracted a number of prominent pupils, including P.D. Ouspensky, a Russian journalist and author of several books on spiritual search, the Russian composer Thomas de Hartmann, and his wife, Olga.

It appears that Gurdjieff planned to establish an institute where his teaching could be studied and put into practice. However, the Russian revolution made it necessary for him and his pupils to move, first to Essentuki in the Caucasus, then by an arduous mountain journey on foot to Tiflis, then to Constantinople, Berlin, Dresden, and eventually to France where he was at last able to establish

an institute in secure conditions. Throughout this period of emigration, the published record of his pupils attests to intense training designed to educate and harmonize all parts of a human being and to correct the lopsided development resulting from contemporary culture and education (de Hartmann and de Hartmann 1964; Ouspensky 1949–2001). It was during this time that Gurdjieff met the artist and theater designer Alexandre de Salzmann and his wife, Jeanne, a Dalcroze-trained dancer. Jeanne became his foremost pupil and worked to spread his teaching after his death.

In 1922, Gurdjieff opened the Institute for the Harmonious Development of Man at the Prieuré in Fontainebleau-Avon, outside of Paris. Leading intellectuals and artists, among them A.R. Orage, editor of the British periodical, *The New Age*, from 1907 to 1922, and mentor of an entire generation of notable authors, were among those attending the Institute. The regimen included vigorous physical work, evening lectures, and practice in the Sacred Dances. In a unique collaboration, Thomas de Hartmann converted often complex melodies, presented briefly by Gurdjieff, into complete piano compositions that were then played for the assembled community. In the daily life of the Institute, Gurdjieff used methods, both challenging and often remarkably compassionate, for helping his pupils to work on themselves and bring the three parts of a human being – head, feelings, and body – into a state of balanced awareness. This first awakening opened a new possibility of consciousness necessary to become what Gurdjieff called “a man without quotation marks” (Gurdjieff 1973–1991, p. 91).

Public demonstrations of the Sacred Dances, also called Movements, and meetings took place in Paris, New York, and other cities in 1923–1924. Groups formed in New York and continued to meet with Orage until 1930. In July 1924, a car accident not far from the Institute left Gurdjieff in critical condition for several months. As he recovered, he began delineating his ideas in a series of three books: *All and Everything: Beelzebub's Tales to His Grandson* (1950/1963/1992), *Meetings with Remarkable Men* (1963/1975/1985), and *Life is Real Only Then, When 'I Am'* (1974/1978/1999).

Until the early 1930s, when the Institute closed owing to the worldwide Depression, students from Britain and the United States would go to the Institute to work directly with Gurdjieff, and he established a pattern of frequent travel to the United States to work with his pupils. They were the first to hear his still evolving literary works, characteristically read aloud in small circles. During the Nazi Occupation, Gurdjieff continued to meet at his apartment in Paris with small groups of mainly French pupils.

After the war Gurdjieff traveled to the USA again, and many of his older pupils, with their own students and children, returned to work with him in France during the last years of his life. In his cramped Paris apartment, he hosted elaborate lunches and dinners, remarkable teaching occasions often ending with Gurdjieff's own music, which he played on a harmonium. In these conditions and in the presence of Gurdjieff, many students, by their own accounts, experienced moments of intense self-discovery. Gurdjieff died in Paris in October 1949.

Gurdjieff's Ideas

Gurdjieff offered a comprehensive framework for inner development in the context of a cosmology. The Gurdjieff Work, his method and ideas, are commonly referred to as the Fourth Way. He taught that the other three ways – the way of the yogi, the fakir, and the monk – focus on one or another of the parts of a human being (mind, body, feeling) and often call for a retreat from life. Gurdjieff believed it to be essential to address all three parts at the same time in the midst of life. The Institute for the Harmonious Development of Man was the blueprint for what is practiced at Gurdjieff centers today, which includes practical work, sacred dances, meditation, and the study of ideas. The aim was to help the three centers of an individual function in harmony, removing barriers to inner development and deepening receptivity to more subtle influences than ordinarily perceived. The essential step in the Gurdjieff Work is to sincerely face one's actual situation, in this moment, now.

Gurdjieff taught that our psychological and spiritual development is ordinarily incomplete and imbalanced. For human beings four states of consciousness are possible – sleep, the waking state, self-consciousness, and objective consciousness – but we ordinarily live only in the first two. Human beings must “work on themselves” in order to realize their full capacity and manifest their true nature. However, as we ordinarily are, we are incapable of maintaining the psychological effort necessary for self-knowledge and inner transformation. A common analogy is that we are “asleep” or “in prison” – slaves to the domination of an associative mind that fosters an illusory self-image and obscures a truer vision of what we are. Gurdjieff asserted that the knowledge required to correct these distortions and to enter the path of self-transformation exists and has been passed down to the present time. He often referred to fragments of this knowledge remaining evident in religion, art, music, folklore, and science.

In order to begin the process of inner development, Gurdjieff believed that we need to see our situation as it truly is. A human being's three aspects – mind, body, and emotions – do not work cooperatively but interfere with each other, causing a loss of the energy that is needed to become more deeply aware of our being and purpose. Through what he called “self-observation” and “self-remembering,” Gurdjieff indicated that we could begin to have a true sense of our situation, which is that we are not fully present or aware, but are instead lost in imagination. We begin to see the false sense of unity, our multiple “I's” that vie for supremacy, chronic tensions, identifications, unfounded reactions, and judgments of ourselves and others. It becomes evident that we do not direct our lives, although we imagine that we do. These insights resonate with Freud's and Jung's psychological views of the therapeutic power of becoming aware of one's unconscious as well as the Buddhist view of the need to “awaken.” But what is missing from modern psychological theories, unless they are informed by some spiritual influence, is the idea of other levels of consciousness beyond our ordinary waking state and of the

efforts required to reach or maintain these (Skeynner 1996, p. 136).

With this understanding of our true situation comes a feeling of something missing, an emergent intuition that our participation in our lives is a shadow of what it could be. Rather than seeking to escape this feeling of lack by ignoring it or blindly trying to overcome it, Gurdjieff taught that the effort to continuously observe this situation allows us to open to a finer level of experience than ordinarily perceived. It is from these impressions that a new sense of oneself and one's place in life can arise.

Only through sincere acceptance of our situation can we begin to live our birthright as human beings and manifest our true potential, living in touch with objective conscience and with our three parts in harmony. And only by the practice of "self-observation" and "self-remembering" can we rediscover that we are composed of two natures: an ordinary nature necessary for functioning in life and an inner nature through which we can be connected to more subtle influences.

Gurdjieff Work Today

Today, more than 60 years since the death of Gurdjieff, the Gurdjieff Work is active and thriving in groups around the world. Before his death in 1949, Gurdjieff entrusted Jeanne de Salzmann and other close pupils to help continue to transmit his teaching. Major centers were created in New York, Paris, London, and Caracas and more in many other cities.

Methods

While the specifics may vary, all groups related to the four main centers engage in the following forms of work:

- *Group Meetings:* Most groups have weekly meetings as peers or facilitated by more experienced students, where pupils explore their understanding gained through study of Gurdjieff's ideas, from the experience of exercises, and from the effort to face one's situation while being in the present moment.

- *Movements:* Gurdjieff left a great many Sacred Dances or Movements derived from his encounters with esoteric and religious cultures in which sacred dance remained a living vehicle for self-study. The Movements are a precise series of positions, often complex and beautiful, accompanied by Gurdjieff's and de Hartmann's piano music.
- *Meditation:* Most groups have a regular sitting practice, which serves as a support for individual and collective inner search.
- *Practical Work:* Preparation for "work in life" is explored as a community during intensive periods, from one to ten days, with activities such as cooking, crafts, and carpentry combined with study, Movements, and sittings.

A large volume of literature, music, film, and other material exists from and about the Work. However, it should be noted that the Work is an oral tradition. While the materials can be inspirational, thought-provoking, and supportive, the actual transmission of the teaching can only occur directly through what is today called "the work together" – and not only by reading or conventional study or thought. The Work is a living teaching, now in its third and fourth generations.

H

Hafiz

Ali Ayten

Department of Psychology of Religion, Marmara University, Istanbul, Turkey

It is an Arabic word used to identify the one who entirely memorizes and recites the Qur'an, the holy book of Muslims, which is over 600 pages with more than 6,000 verses. The word *hafiz* is also used for those who memorize the sayings of Prophet Muhammad in certain numbers, but these are rare.

The first to memorize the Qur'an was naturally Prophet Muhammad as the Qur'an was revealed to him. Given that the Prophet was an unlettered man, his early followers eagerly recorded and memorized each new revelation as it was revealed. By the time the Prophet passed away, many had memorized its entirety. This custom has been kept up throughout the Muslim world, and hundreds of thousands have memorized it. Although the number of those who endeavor to memorize the whole Qur'an seems to have been decreasing in the age of computerization, it is still one of the highest goals in Muslim life to become a human repository of the Qur'an. Being hafiz is

still one of the most rewarded honorifics in Muslim society. The *hafiz* feels a psychological pressure on himself/herself to be a committed, decent, and virtuous member of the society as she/he is believed to bear a sacred trust in his/her mind.

Prophet Muhammad encouraged his followers to read and recite the Qur'an, if not to memorize its entirety, and cherished such followers. In the first centuries of Islam, mosques were used to memorize the Qur'an, but later, special courses in *madrasas* (Islamic school) or a special school called school of memorizers (*dar al-huffaz*) were opened. In the beginning, teachers developed various techniques of their own, but these have been evolved into specific methods over time. Some asked students to memorize verses in fives first before going into the next ten. Some favored memorizing page by page to repeat the already memorized page the following day. Students begin memorizing the Qur'an at very early ages and many memorize the whole Qur'an before adolescence.

Hajj

Ali Ayten

Department of Psychology of Religion, Marmara University, Istanbul, Turkey

Hajj is an Arabic word meaning to face and visit a sacred place. It is one of the five pillars of Islam. The *Ka'bah*, in the city of Mecca, Saudi Arabia, the house of God (Allah) built by Prophet Abraham and his son Ishmael, is the only pilgrimage site in Islam. It is a duty of Muslims to visit the Ka'bah once in a lifetime if one can afford it financially and physically. Currently, three million Muslims make hajj every year.

The ritual of hajj is performed on certain days of the year, the first days of the twelfth month (*Dhul-Hijjah*) of Islamic calendar, followed by the Festival of Sacrifice. Visits to the Ka'bah at other times are called *umrah*. The obligatory rituals in *hajj* are to circumambulate the Ka'bah for at least seven times and stay at the hill of Arafat, not too far from the Ka'bah, for some time on the 9th day of the twelfth month. Other rituals include symbolic pebble throwing at an effigy of Satan as well as walking quickly between two locations called *Safa* and *Marwa*, also in Mecca, between which Hagar, the wife of Prophet Abraham, searched for drinking water for her son Ishmael. One who performs the hajj is called "*haji*" (pilgrim), a highly respected title in the Islamic world, which encourages one to live a moral and religious life by keeping away from sinful acts. All pilgrims are supposed to wear white garments (a pilgrim's special dress called *ihram*) during *hajj* which represents the fraternity of all races and nations.

The ritual of hajj is supposed to affect the pilgrim deeply and transform him/her spiritually. It covers many symbolic and sentimental acts. The white gown, having no other belongings, represents physical and spiritual purity to make the pilgrim feel humble and that she/he is nothing but an ordinary being ever dependent on the Lord. It also symbolizes that the person is bereft of worldly desires and ready to return to the

Creator as she/he was born. Millions from every color, race, and nation meet around the Ka'bah to feel united in a spiritual ambiance leaving all differences behind. Pilgrims place their hands on the black stone (*Hajar al-Aswad*), which is believed to have descended from heavens, located on the corner of the Ka'bah, at every turn of circumambulation to renew their submission. Pilgrims walk in patience between the hills of Safa and Marwa renouncing unwanted habits. By throwing pebbles at an effigy of Satan, they symbolically remove themselves from Satan, who endeavors to lead humans astray. And they finally slaughter an animal to show that they are ready to sacrifice what they have for the sake of their Lord. Hajj, more than anything, is a practice for the Day of Judgment with millions of people from all over the world gathering around the house of God. Pilgrims therefore feel the imminence of the Day of Judgment when they will account for their acts in this world.

Hallucinations

Nicholas Grant Boeving

Rice University, Houston, TX, USA

Numerous theories have been put forward to account for the origin and persistence of hallucinations among the human species. Historically, endogenously arising hallucinations were seen as evidence of either divine or demonic possession – usually the latter. Orthodox psychodynamic theories view hallucinations as unconscious projections of neurotic conflicts or as externalized wish-fulfillment fantasies, while biologically

situated theories interpret them as dysfunctions of the brain – typically involving the neurotransmitter dopamine. Hallucinations may occur in any sensory modality – visual, auditory, olfactory, gustatory, tactile, etc. – with auditory and visual being the most frequent and the most frequently associated with psychotic disorders such as schizophrenia.

Hallucinations may be stimulated exogenously with the imbibition of certain psychoactive substances. Pharmacologically classified as hallucinogens, these substances would come to be known in common culture as psychedelics (mind-manifesting) and later as entheogens (god-manifesting). Regardless of moniker, the constellation of effects produced by compounds belonging to this group includes altered perceptions of reality and self, intensifications of mood, visual and/or auditory hallucinations, distorted sense of time and space, and an enhanced sense of meaningfulness. Modern pharmacology distinguishes psychedelic agents from other classes of drugs in their unusual ability to produce the aforementioned effects that are known only to occur in dreams or “times of religious exaltation.” Prevalent medical models reductively view hallucinations as the result of disrupted information processing in cortico-striato-thalamo-cortical feedback loops that facilitate the filtering of external stimuli.

Entheogens maintain an important, albeit controversial, place in the history of religions. There is ample evidence to suggest that mind-altering compounds have been used since remotest antiquity by virtually all peoples of the Earth to induce altered states of consciousness. Particularly important in the shamanic context, the ritual consumption of substances (ayahuasca, peyote, mescaline, *Salvia divinorum*, etc. – all plants and plant extracts which generate powerful hallucinations) extends across all cultures and throughout all times, including Siberia, Asia, Europe, and North and South America. Approximately 150 psychoactive plants have been identified in recent ethnographic research as still being used in indigenous religious customs today.

As the academic study of religion began to develop at the dawn of the twentieth century,

efforts were redoubled to apprehend the historical opacity of religious texts and to link the mythic places and potions of the past with physical locations, actual plants, and historical people.

The amateur ethnomycologist R. Gordon Wasson is perhaps best known for his work on the ancient Vedic god Soma. In a book as internationally reviled as it was universally lauded, he put forth the theory that Soma was one in the same with the fungus known as *Amanita muscaria* – or the fly agaric – which, once imbibed by the officiating priests, was then passed through the body and voided by the bladder only to be drunk again, the process resulting in dramatically altered states of awareness. He theorized that the entirety of Eastern religion owes its modern philosophical orientation to the ecstatic visionary states that Soma produced once consumed.

In a later work written in conjunction with Albert Hoffman, discoverer of LSD, he put forth the theory that the beverage known as *kykeon*, an intoxicating brew central to the rites of the Eleusinian Mysteries, was, in fact, a fermented derivative of barley containing ergoline alkaloids from the ergot fungus, from which LSD was originally synthesized.

In a similar vein, the Pythia of Delphi is believed by some to have entered states of ecstatic trance after inhaling the noxious and hallucinatory fumes rising from the fissures of her subterranean abode before offering oracular advice. The alleged identities of these vapors have spanned the entire spectrum of hydrocarbon gases, but most authorities agree that ethylene, which has been empirically confirmed as producing trance-like states in persons exposed to sufficient quantities and concentrations, is the most likely candidate. These are but three of many such theories attempting to link the intoxicants of antiquity with known mind-altering compounds of the present.

The post-Enlightenment lenticular structures of the modern age have been brought to bear on the issues of entheogens. Inquiries from fields as disparate as psychology, neurology, theology, and medicine have all made significant impacts in advancing our collective understanding of these perplexing substances and their even more perplexing effects. Beginning in the 1950s,

government sponsored research projects on psychedelics ranged from efforts to “cure” schizophrenia (as the effects were seen to temporally mimic psychotic states) to the treatment of alcoholism. More existentially oriented projects such as psychedelics’ effects on quality of life as well as exploration into how transcendent states are neurochemically mediated were soon to ensue.

Psychologists were quick to take note of the transformative potential of psychedelics, particularly of how a confrontation with death in a ritual context could lead to a reduction in the fear of mortality. Timothy Leary, Ralph Metzner, and Richard Alpert (1995), all on faculty at Harvard, began a series of experiments investigating the effects of LSD on initiating transcendent mystical experiences. This psychologization of spirituality would prove to be inextricable from the transmission of Eastern religious traditions to the West, although this indebtedness to entheogenic sources would remain infrequently acknowledged.

Research was to effectively cease in 1963, when access to these substance became restricted, making them nearly impossible to procure. Due to the incendiary rhetoric surrounding the dangers to both society and self that hallucinations purportedly posed, public interest soon subsided along with the Academy.

Commentary

Presently, entheogenic research is enjoying a scientific recrudescence. Experimental treatments for addiction using ayahuasca, psilocybin, and ibogaine have already been met with impressive success. New research on ketamine and the inducement of near-death experiences (NDEs) holds much promise for the continued unlocking of the mysteries of the mind. Perhaps the most beguiling question of all becomes then: how can we understand alleged alterations of consciousness without first understanding consciousness itself? This crucial question is central to the concerns of both psychology *and* religion and will continue to unveil progressively deeper accounts

of these mysteries as inquiries of this nature continue to unfold within the fields of psychology, religion, and the meeting of the two.

Hanging and Hanging God

John Eric Killinger
The Intermundia Press, LLC, Warrenton,
VA, USA

Deriving from two Old English words *hangian* and *hon*, and supported by the Old Norse *hengja/hanga*, “to be suspended,” *hanging* is also influenced by the Sanskrit *sankata*, “hesitate,” and the Latin *cunctari*, “to delay, defer, suspend.” Despite the fact that the terminology “hanged” is usually reserved for legal language, the word has also extended into metaphoric usage (e.g., *I’ll be hanged*, *hang-up*, and *hanging out*). There are affinities in Hebrew (תָּלָה, *tālā*, “hang up, let down, dangle, put to death by hanging,” Genesis 40:22, 2 Samuel 21:12; Esther 9:14) and Greek *kremamai* and *kremannymi* (κρέμαμαι in the LXX (Septuagint), but seven times as κρεμάννυμι in New Testament, referring to dependence on the

entire law and the prophets (Matthew 22:40), execution of the two crucified with Jesus (Luke 21:39), and specifically to “crucifixion” in Galatians 3:13, even though it is derived from the Deuteronomic code (תלייה, *tālā ’al* in Hebrew for “hanging after execution”). With the prepositions *around* and *on*, this Greek usage also literally meant hang, as in the millstone hung around one’s neck (Matthew 18:6) and the snake that bit Paul on the hand (Acts 28:4), respectively. Hanging upside down, as St. Peter reputedly suffered, is a mark of humiliation and derision, a reversal of what the person stood for prior to being hanged. Such a method of hanging was called “baffling” (Spenser 1978, p. 956).

Hanging was, according to the Old Testament, allowed but seems to have occurred *after* a person was executed. In compliance with Deuteronomic law, the body was to be removed before nightfall so as not to pollute the land given by God as an allotment. Even as early as the story of Joseph in Egypt, hanging consisted primarily of beheading followed by the displaying of the decedent’s head on a pike. King David’s eldest son Absalom caught the long locks of his hair in the low branches of an oak tree during his flight and was left hanging “between heaven and earth.” Disregarding the order to spare the king’s son, Joab, David’s chief general, kills Absalom with three spears to the heart (2 Samuel 18:9–15).

A liminal feature occurs in hanging. This is particularly true with regard to hanging gods such as Jesus the Nazorean who claims oneness with God, Odin the Norse All-father, Attis, and Osiris, who prior to his Dionysian dismemberment hung like Jesus for 3 days. According to Frazer (1914/1936, 1922/1996), the Phrygian satyr of Lydia, Marsyas, along with Adonis, Artemis, and even the fair Helen, ought to be included in this list of hanging gods. We might ourselves include Herman Melville’s Captain Ahab who had a crucifixion in his face (Melville 1967, p. 111) and the twelfth card of the Major Arcana in Tarot known as the Hanged Man. This liminal feature is *intermundia*, a state of being suspended between worlds suffused with death and rebirth – it is the

presence of the absence of *ananke*, or necessity. It is not-space space and not-temporal temporality in much the same way as the alchemists called the *lapis philosophorum* the not-stone stone, or *lithos ou lithos* (λίθος οὐ λίθος). Cicero (2000), in his *De natura deorum*, translates Epicurus’ term *intermundia* as *metakosmios* (μετακόσμιος), the place wherein he consigns the Greek pantheon. *Metakosmios* is derived from the verb *metakosmeō* (μετακοσμέω), *rearrange*, *modify*, and *changed in aspect*. Metaphorically it is a new arrangement, a change of condition, even a change of character, indicating its transformative aspect.

Hanging, this pathos of the god, even human hanging, often occurs outside the city wall. Jesus was crucified on the green hill of Golgotha outside of Jerusalem. Odin underwent hanging on the windswept World Ash Tree, Yggdrasil, away from human and divine contact, yet rooted to all and none. Osiris was encased in Set/Typhon’s beautifully wrought sarcophagus that became hung up and further entombed in the trunk of a tamarisk tree after floating down the Nile, which is also “up” as it would be northward, for as above, so below. Attis, who in alchemy is synonymous with the Egyptian god Osiris, performs his self-mutilation under a sacred pine tree and, in accordance with later ritual, is portrayed in effigy and hung on the pine tree as the officiating leader of the Attis-Cybele rite sheds his own blood to promote the fertility of the crops for the coming year. The Attis-Cybele myth is linked to the Artemis-Actaeon myth (and that of Isis-Osiris) and those of the respective fragmentations of Dionysus and Orpheus, whose misogynistic “madness” causes the Thracian maenads to tear him apart. The spirit of union not yet extracted is still part of the greatest dilemma of human beings today, according to Schwartz-Salant (1995). This is the “conclusion” to the problem and recognition that fragmentation, rather than repression, has a greater significance for development and pathology. Thus, being wounded to the point where one is branded a heretic or even an apostate necessarily moves the soul to action.

Prayers and other cultic acts carried out in the hope of fertile land and crop abundance occur in the rites of Tammuz. Ezekiel 8:14 refers to the lamentation of the women over the death of Tammuz (תַּמְּזֻז, Θάμμουζ) as an abomination to the Lord in the kingdom of Judah. Tammuz, or Dumuzi (whose name means “proper son [or child]”), was the Sumerian shepherd who married Inana, died, and was resurrected by her. Even Inana must be executed and hung like a piece of rotting meat in the underworld. When she ascends, she gives up Tammuz in her place. He escapes, then is captured, only to be freed by the love of Inana. Like Persephone, Tammuz is to spend half the year in the underworld, the other half upon the earth. The mythology of Inana-Tammuz is reckoned to date back to 3000 BCE and encroached upon ancient Palestine, being given some recognition in various circles of the culture of Jerusalem. Ezekiel’s astonishment is at seeing the lamentations of the Tammuz cult infringe upon the sacred center of Jewish religion. Despite such lamentations being viewed as supplementary to the worship of YHWH, the abomination of it lies in its being an insult to the “living God” and nothing short of apostasy.

Tammuz is related to Osiris and also to the mythology of the Phoenician Adonis, whose origins are not of the Greek classical period but semitic. According to Zimmerli (1969/1979), the lament of the death of Adonis (the Phoenician vegetation god type) is also attested in the Septuagint versions of 1 Kings 14:13 and Jeremiah 22:18 (242). Adonis’ name derives from *adon* (אדון), meaning “master, ruler, lord.” *Adōn* is the aleph and tav, alpha and omega, the one who was, is, and *is to come*. The Masoretic text of the Hebrew Bible (Old Testament) uses *Adonai* to refer to the tetragrammaton YHWH, and this would connect Tammuz/Adonis/Osiris with Jesus in this respect. Not only this, it freightes the reading of Ezekiel 8:14 with difficulty, imbuing it with a kind of fundamentalist repression, for example, “If you are not with me, you are against me.”

The liminal state involved in hanging may be long or short. The unusual swiftness of Jesus’

execution, which only lasted a matter of hours, comes as both a surprise and astonishment. Performed as a deterrent against rebelliousness, many Roman crucifixions lasted as long as 3 days. Jesus was forced to carry the *patibulum*, or cross-beam (also “dungeon,” “torture”), probably several hundred meters to the execution site where the seven-foot-tall stipes (vertical beam) would have been erected and awaiting him. Curiously, the vertical pole, called *stipes* in Latin, means both “tree trunk” and “instrument of torture.”

The chronicling of Osiris the great Egyptian god of resurrection, found primarily in Plutarch (1936), had nine watchers and nine mourners, aligning it with Odin’s nine whole nights and nine songs. Like the division of the uroboros in the *Pistis Sophia* into twelve aeons, Osiris’ night realm was divided into twelve parts. In Kabbalah, the number twelve represents the philosopher’s stone. Twelve also is represented by the Hebrew letter *lamed* (ל). Lamed is the heart and central letter of the Hebrew alphabet. Because it towers over the other letters, it represents the King of kings, an attribute also given to the Hanged Man, the twelfth trump of the Tarot’s Major Arcana. The poles of this Tarot card could refer to the Egyptian two-finger amulet that was placed either in the swaddling of the mummified remains of the deceased or loose in the coffin. These amulets represented the two fingers of the god who helps Osiris ascend the Ladder of Rē.

The Norse god Odin’s hanging lasted nine whole nights, according to the *Hávamál* of the Poetic, or Elder, Edda. Like Jesus, Odin suffered impaling with a spear, screamed as he reached for the runes, which might perhaps have been tinged with the horror of forsakenness (as he received no bread or drink-filled horn), and sacrificed himself to himself. In the process, he learned nine powerful songs. As his wisdom grew he came to know 18 powerful charms or runes, the twelfth of these, curiously, concerning the freeing of a hanged man for conversation. This death of god to become god is not unlike the death of Jesus on the cross. It is the death of God effected *in* God, the breaking of old patterns that bind, limit, or restrict one’s nature – the interface of *religare* (religion as tied

or bound back to a previous state of existence) punishing *religere* (religion as embodiment of reflection and connection) or remembering versus unforgetting, as in the alchemical representation of the winged and wingless birds forever attached to one another. Odin, like Teiresias, goes through a purgation through suffering in token of new insight. Thus the metaphor of hanging as transformative act demonstrates that the hanged god moves through a transition from knowing about to becoming being, as in the movement from knowledge/curiosity to unknowable ultimate reality (K → O).

Like Odin, the Hanged Man card of Tarot's Major Arcana is often depicted with his head deep in the earth, seeing its secrets as Odin saw the secrets of Yggdrasil. With the card turned upside down, the hanged man appears to be dancing in the abyss over which he had been suspended. This curiously links Odin with trickster associations. Connected with this is the sense of eutony (εὐτονέω, *eutoneō*), meaning "having or possessing faculties." Its shadow aspect includes the meaning "distension." Kestenburg (1978) describes eutony as a stretching out, "transsensus." Characterized as breathful flowing, eutony/transsensus is similar to the diaphragmatic breathing practiced in yoga and tai chi, as well as choral and opera singing, and the playing of wind instruments that spiral us back to the Phrygian satyr Marsyas and the vanity of his musical challenge of Apollo. As a follower and comforter of Cybele following the death of Attis, he was renowned as a flautist, and because of his fame, he provoked Apollo into a musical contest. Marsyas would have won had not Apollo dared Marsyas to play his pipes upside down. Marsyas lost the duel, with the result that Apollo hung and flailed him upon a pine tree.

Such suffering, then, is helpful to us. It can indeed, as Moltmann (1974) asserts, be spiritually healthy. Despite being vulnerable, afraid, and alone, we wait for what will come and we are on the verge of something greater than we can know or about which we can think or attain through action. That is beginning to experience a new level of consciousness without preventing

the advent of what can come, if indeed it is on its way.

Happiness as a Goal

Marta Green

New York, NY, USA

Mercury Pier Publishing, Hong Kong Special Administrative Region of the People's Republic of China, North Point, Hong Kong

Two questions require attention at the outset. First, whose goal is this? Second, what exactly constitutes a working definition of happiness? This entry does not attempt to address the second question in its short form due to the many assumptions inherent in the use of the word across all cultures and in all languages. The Chinese word for happiness, for example, is made up of two other words “open” and “heart.” As poetic and evocative as this usage may be, it does not aid in arriving at an actual definition. The term happiness must then be bracketed.

That happiness is a conscious goal at all seems to be a product of the Enlightenment. One such famous example can be found in the United States Declaration of Independence which groups the word among what modernist discourse deems to be basic rights by guaranteeing everyone in America (excluding slaves and women) the right to “life, liberty, and the pursuit of happiness.”

To begin to address the second question, a definition of happiness must be both deepened and broadened. Abraham Maslow's hierarchy of human needs provides an excellent model with which one can address the psychological experience and physiological requisites that might form such a definition. By classifying five categories of needs in ascending order (physical, security, love/relationship, esteem, and self-actualization), Maslow overlays humanist assumptions with universal needs. This parallels the generally held assumption that happiness as a goal is a universal phenomenon. Maslow goes one step further by proposing that self-actualization, the highest level in his hierarchy, is a need just like any other (water, food, sleep) but one that the individual is unlikely to address until all of the needs underlying it have been met.

Hasidism

Kate M. Loewenthal

Department of Psychology, Royal Holloway, University of London, Egham, Surrey, UK

What is Hasidism? How has it been related to psychology and to the psychology of religion?

What is Hasidism?

The term “Hasid” occurs quite widely in Jewish texts, particularly those concerned with ethics, generally referring to righteous individuals. Hasidism also refers specifically to the pietist movement which developed in eighteenth-century Ukraine under the leadership of Rabbi Israel Baal Shem Tov (literally “master of the good name,” sometimes abbreviated to BeShT). Hasidism raised morale after the ills of the seventeenth century: the 1648 Chmielnitzki pogroms, which destroyed many communities and the religious disorientation caused by the antinomian Sabbatian movement. Hasidism is often seen as an attempt to dismantle the elitism of Eastern European Jewish life, in which prestige accrued to religious study and to wealth. Hasidism asserted the spiritual worth and potential of every individual. The movement spread rapidly, as the Baal Shem Tov and his disciples traveled with the purpose of freeing poverty-stricken Jews imprisoned for debt, disseminating Jewish

teachings including the “inward” aspects, based on kabbalah (Schneerson 1980). Leadership passed to the Maggid of Mezritch and then branched out into a number of schools each headed by a Hasidic Rebbe emphasizing a particular style of divine service. In the second and third generations, the movement was opposed by the mitnaggedim (lit. “opponents”) who obtained the support of the famous Rabbi Elijah Gaon of Vilna, himself a kabbalist and a recluse. He thought Hasidism was yet another form of an antinomian movement. Around 1800 a distinction emerged between the Habad school, which emphasized the primacy of intellectual understanding in order to arouse spiritual feelings, and the so-called Hagat style, which emphasized the primacy of emotional fervor in worship. The term “Habad” is an acronym for the intellectual divine attributes: wisdom (hokhmah), understanding (binah), and knowledge (daat). “Hagat” is an acronym referring to three first of the seven emotional attributes: kindness (hesed), severity (gevurah), and beauty (also understood as mercy) (tiferet). Hasidic teachings can be seen as the latest stage of the Jewish mystical tradition (Scholem 1941).

By the late nineteenth century, it was estimated that well over half of Eastern European Jewry were identified as followers of one or other Hasidic Rebbe. Eastern European Jewry was particularly devastated by the holocaust, but post-World War II has seen the revival of Hasidic life particularly in Israel, the USA, and Europe, also in Australia and South Africa. Habad Hasidism has been particularly active in deploying emissaries to hundreds of Jewish communities worldwide, forming nuclei of outreach activity. Other schools of Hasidism live in enclave-style communities, and such communities have proliferated and enlarged in Israel, Europe, the USA, and elsewhere. Hasidism is a salient force in so-called “haredi” (strictly orthodox) Judaism, although mitnaggedic and other non-Hasidic styles of strictly orthodox Judaism are also important.

The twin themes of Hasidism are love of God and love of fellow humankind. In practice this involves scrupulous and inspired maintenance of the divine commandments (mitzvot), religious study including the “inward” aspects of Jewish

teaching (especially among Habad), and care for others. Dress is distinctive: for men, black frock coats or suits, hats, and sidelocks and, for women, modest dress including sleeves below elbows, skirts below knees, and hair covering.

Other strictly orthodox Jews adhere to a similar dress code and scrupulous observance of the commandments. What distinguishes Hasidism is the close adherence to the charismatic and inspirational leader, the Rebbe, whose advice and blessing may often be sought, which entails a close-knit social community.

As mentioned, Hasidism is informed by kabbalistically based teachings, the so-called “inward” aspects of Jewish teaching. A classic text is *Tanya* (Shneur Zalman of Liadi 1796/1973), which is of considerable interest to psychologists of religion. Features of this work include a description of the human spiritual yearning to be united with the divine, the incessant spiritual struggle between the good impulse, based on the divine soul, and the animal impulse, towards selfish comfort. Hasidic teaching is not strictly speaking ascetic: the material world is to be used appropriately, according to Jewish law, and in this way the divine sparks that are trapped in creation will be raised to Godliness. The soul has a natural desire to be united with its divine source, and this can be achieved in prayer and in right action. Particular emphasis is placed on charity and kindness to others. Hasidic psychology is thus underpinned by strong moral and spiritual themes. Human psychic structure is a microcosm of the macrocosm, which involves a progressive down-chaining of creation from its divine source, through the four “worlds” of emanation, creation, formation, and action, each comprising the ten divine attributes (wisdom, understanding, knowledge, and seven emotional attributes), until practical action is achieved. This scheme derives from Lurianic kabbalah and expounds the cosmic significance of individual actions.

Hasidic teaching is not addressed solely to Jewish audiences. Rabbi Menachem Schneerson thought that the second section of *Tanya*, which presents a system of contemplation of the spirituality of existence, has universal relevance. He taught that “right living” involves the

performance of those commandments obligatory on the particular individual, and for non-Jews this involves the seven commandments of the descendants of Noah (see Clorfene and Rogalsky 1987; Cowen 2003), including belief in the unity of God, the practice of sexual morality, honesty, and avoiding cruelty to animals.

There have been a number of attempts to apply Hasidic insights into the practice and understanding of psychology, some written for lay audiences and others for academic and professional clinical audiences. The latter genre includes Rotenberg (1995), Weiss (2005), and Berke and Schneider (2008). These authors have used and examined Hasidic and kabbalistic teachings and concepts in relation to psychological and psychoanalytic understanding of behavior and feeling. Rotenberg, for example, suggests that the kabbalistic paradigm of creation may lead to a less assertive-aggressive style of communication, sexuality, and communication compared to the Western norm.

Another genre has been the psychological study of Hasidism and its distinctive features of social organization and spirituality. Schachter-Shalomi (1991) has examined the dynamics of the relationship between the Hasidic leader (Rebbe) and the follower (Hasid) in the one-to-one encounter (sometimes known as *yechidut*) in which the Hasid seeks advice and blessing. Winston (2005) has studied young men and women who have chosen to leave the (Satmar) Hasidic lifestyle; Satmar is often said to be particularly strict in its outlook. El-Or (1994) has studied the beliefs and values of Hasidic women from the Gur group, in *Educated and Ignorant*, in which women emphasize the value they place on their role as the center and foundation of the home. Other studies of Hasidic women have often focused on the outreaching Lubavitch group, for instance, Loewenthal's (1988) study of religious development and commitment in this group and Levine and Gilligan's (2003) *Mystics, Mavericks, and Merrymakers*, a study of adolescent girls. Another important genre involves the attempt to examine the inspirational fervor of Hasidic worship and to distinguish it from psychopathological states: Idel's (1995)

work on ecstasy and magic and Mark's (2009) work on mysticism and madness in Braslav Hasidism are noteworthy examples.

A striking feature of Hasidic life is the high value placed on family size: bearing and rearing as many children as possible is a feature of strictly religious Jewish life, with an average of six children per family. Children are seen as a blessing. Family size has an impact on the well-being of the women, men, and children concerned, and this impact is often positive, as has been the impact of the value placed on marital and family stability (e.g., Frosh et al. 2005; Loewenthal and Goldblatt 1993; Loewenthal et al. 1995).

In conclusion, it may be stated that Hasidism, a pietist movement within Jewish orthodoxy, has inspired considerable interest, not only among those looking for New Age-style spirituality but among academic and professional psychologists. Its intense spirituality and kabbalistically based teachings have important psychological content, in which human psychology is depicted as driven by spiritual and moral striving. Aspects of Hasidic life have been studied by social scientists and psychologists, and there is clearly scope for further work.

Hate/Hatred

Dianne Dentice

Stephen F. Austin State University, Nacogdoches, TX, USA

The basic tenets of Christianity emphasize love and forgiveness for one's neighbor. Many people who study the *Bible* and are identified as Christian

believe the premise of equality for all God's people, no matter the race. According to Douthat (2012, p. 2), every human culture is religious, and religion informs what individuals believe about some ultimate spiritual reality. Douthat's hypothesis argues that the problem with America is neither too much nor too little religion, but rather bad religion (p. 3). He points out that many evangelical Christians believe that the United States is in decline because the nation's leaders strayed from the original covenant with God that insured a Christian nation. Other, more mainstream Christians believe that America is a product of Enlightenment secularism (Goldberg 2007, p. 27). The focus of neither religious perspective is centered on race.

Within the ideological world of Christian Identity, an extremist religion associated with the white supremacist movement, adherents argue that both traditional and evangelical Christianity overlook fundamental, immutable differences between human groups. They agree with the Christian right that America was founded as a Christian nation, and something went dreadfully wrong along the way. Less politically correct than evangelicals represented by Billy Graham, Sr. and Jr., Joel Osteen, and Pat Buchanan, Christian Identists have a convenient scapegoat for the nation's ills: non-English-speaking immigrants, other out-groups, and homosexuals. They believe that equality in all its manifestations is a myth that has been propagated by a church heavily influenced by outside forces and in denial about the existence of inherited differences, especially racial differences among human groups. In an attempt to settle the controversy and justify prejudiced attitudes aimed at nonwhite groups, Identity ministers use scripture to bolster their belief that the *Bible* does not support the essential unity of humanity. Identity practitioners argue that the most important traits are inborn and reflect psychological/behavioral differences between people. Utilizing research on intelligence and behavior produced by two controversial psychologists, Arthur R. Jensen and J. Philippe Rushton, more educated Christian Identists contend that their scientific findings confirm the inarguable fact of inherent racial differences (Duke 2000, p. 132).

Jensen, an educational psychologist, suggested that the gap in intelligence test scores between Black and White students might be rooted in genetic differences. His interest in differential psychology struck a nerve with the nature versus nurture community of scholars and human rights advocates. In an article published in the *Harvard Educational Review* in 1969, Jensen argued there are two specific types of learning ability: Level I entails the retention of facts and Level II is the equivalent of general intelligence. His study revealed, after administration of IQ tests to diverse groups, that Level I ability was fairly consistent across races. However, his examination of Level II ability varied across races with Whites scoring higher than Blacks and Asians scoring higher than both Whites and Blacks. Labeled a racist by some and a misunderstood genius by others, his work is widely cited by individuals who believe that Whites are inherently superior to other racial groups (Duke 2000, pp. 47, 60–61; Robertson 1981, pp. 18, 23).

Rushton's theory that racial group differences are influenced primarily by genes added fuel to the fire of racist interpretations of the *Bible* in Christian Identity circles and on hate-related Internet Web sites such as *Stormfront.org*. In 1985, he averaged the results of adults from 25 countries using the Eysenck Personality Questionnaire in an attempt to compare temperament and personality traits across the following three groups: Whites, Blacks, and Asians. His findings supported his theory that Blacks are more aggressive, impulsive, and excitable than Whites and Asians. With regard to sexuality, Rushton and Bogaert (1987) argued that the same patterns can be found with regard to reproductive or sexual restraint. Their study found that Blacks had more sexual partners, more permissive attitudes toward sex, and less control over sexual behavior than did Whites and Asians. Additionally, Rushton (1990) found that from 1983 to 1986, Eastern and European countries reported less incidences of rape, murder, and assault than did African and Caribbean countries. These findings inform much of the racist rhetoric employed by adherents of Christian Identity theology (Ostendorf 2001/2002, p. 26).

Christian Identity: A Racist Religion

Wesley Swift, a significant figure during the 1940s and 1950s in America, combined British Israelism and political extremism which produced an early version of Christian Identity ideology. He founded his own church, the Church of Jesus Christ Christian, and used radio to broadcast his sermons to audiences throughout the western region of the United States. Swift argued that God's chosen people are Whites whose rightful legacy was stolen with the seduction of Eve by Satan in the Garden of Eden. Swift and his mentor, Gerald L. K. Smith, warned their followers that mainstream Christian ministers were false prophets because of their support for religious revivalism and unification following World War II. Christian Identity theology contains no central orthodoxy, and Identity ministers offer widely divergent doctrines that are all based on individualistic approaches to interpretation of the *Bible*. They do agree that Whites are superior to all other races; therefore, they are the only group that can achieve eternal salvation. Rushton's and Jensen's work on intelligence and race differences marked both men unwitting contributors to the continuing evolution of the Christian Identity movement as it attracts a new generation of believers.

While Swift wrote before Jensen's and Rushton's time, his message was consistently anti-Semitic and racist. He is author of a version of the two-seed theory that traces the evolution of human groups from the Garden of Eden. He argues that the Fall was brought about by an unholy sexual union between Satan and Eve (*Genesis* 3:1). Also known as Lucifer or the "serpent," he appeared to Eve and convinced her to go against God's command regarding the Tree of Knowledge of Good and Evil (*Genesis* 3:3). Swift explains that when Eve was exposed for her sin, she told God that the "serpent" beguiled her (*Genesis* 3:13). According to Swift's interpretation, Eve sinned by having illicit sex with Satan and then she somehow convinced Adam to have sex with a dark woman from a pre-Adamic race living outside the Garden (*Genesis* 3:15). Out of these unholy unions were born Cain, the son of Satan, and Abel, the son of Adam (*Genesis* 4:1). As the story goes, Cain kills Abel and becomes

estranged from Adam and Eve. Eventually, Jesus proclaims that Satan is not only the biological father of the hell-bound race of dark-skinned pre-Adamic people but also of the Jews (*John* 8:44).

There are other Identist interpretations of the *Bible* and original sin as well. The late Identity minister Dan Gayman lived and worked during the 1980s and 1990s. More contemporary than Swift, he also cites *Genesis* 1:38, 2:15–17, and 3:17–19 in his explanation of the Fall. God created Adam in his image and instructed him not to eat of the Tree of Knowledge. Adam did not listen, sinned by eating the apple, and subsequently became estranged from God. Gayman contends that the ability to know, understand, and walk in obedience to the laws of God belonged to Adam and not to other races. Adam represents the history of the White race, and God's covenant begins with him and extends to the twelve lost tribes of Israel. Gayman's ministry was based on the doctrine that there is no unity of races in the *Bible* primarily because nonwhite races did not descend from Adam and Eve but from others living outside the Garden of Eden. According to a consensus among Christian Identists, Adam was created in the image of God, and Jesus and his disciples were white Israelites, not Jews (White 1989, p. 12). Swift's and Gayman's theological perspectives are two examples of ways in which Christian Identity dogma justifies separation of races based on intractable inherent differences.

Race Science and Heresy: An Unholy Alliance

In his pamphlet *God's Call to Race*, Wesley Swift predicted that the return of Jesus would occur before the 1000-year epoch. Subsequent premillennialist Identity preachers influenced by his teachings count on the final battle (in the guise of a race war) to be waged in North America. According to this worldview, the second coming of Christ will be preceded by a period of tribulations that will usher in a 1000 years of peace and harmony (Ostendorf 2001/2002, p. 41). In contemporary Identity circles, both Swift's and Gayman's legacies continue and are supported

by anti-Semitic, racially biased books, pamphlets, audio, and video tapes that serve up interpretations of the *Bible* that deviate from Christian beliefs about the sanctity of human life, no matter the race. Leaders in Identist circles also call on other sources to explain Black on White crime rates, the moral degeneration of the American society, and the innate intellectual inferiority of African-Americans specifically (Herrnstein and Murray 1994, pp. 241–251, 319–320, 330–331; Taylor 1992, pp. 36–37, 294–295).

Thanks to the Internet and social media, a new generation of potential believers is learning about the Racial Holy War and its soldiers (Brown 2009, p. 189). The category of other is positioned within *Stormfront.org* discussions as a conspiratorial alliance between Jews and Blacks in their collective efforts to malign and destroy Anglo-Saxon culture (Meddaugh and Kay 2009, p. 259). Discussants sometimes cite scholarly sources such as the one started by Olympus on August 8, 2015. The thread titled “Scientific arguments that destroy the ‘race is a social construct’ mantra” contained a variety of posts soliciting scientific opinions negating the anthropological argument that human races do not really exist (<https://www.stormfront.org/forum/t1114187/>). The discussion also contained a YouTube video of a lecture Rushton gave to an audience at a conference hosted by the New Century Foundation, an organization founded in 1994 by Jared Taylor to study immigration and race relations and the consequences of America's increasing diversity. Another thread started by Saxon Assassin on April 4, 2014, titled “The g Factor, reviews?” promoted Jensen's book, *The g Factor: The Science of Mental Ability* (<https://www.stormfront.org/forum/t1033639/>).

The work of Jensen and Rushton has elicited criticism within the scientific community for years. C. Loring Brace of the Museum of Anthropology, University of Michigan, had strong words for Jensen in his review of *The g Factor*:

Races may themselves be social constructs, but since people believe in them, they live on as entities to be invested with varying amounts of “g”. . . . not only do races have no biological coherence, but an assessment of the millions of years of hominid prehistory leads to the null hypothesis that there should be no difference in mental capability between any human groups. . . .

Assumptions to the contrary qualify as racialism and actions based on those assumptions qualify as racism.

Rushton never veers from his claims that there is a highly consistent pattern of average differences among the three major races and that these differences cannot be explained away by environment. Gottfredson (1996) suggests that even with all the debate surrounding his theory of evolutionary divergence of the races, no one has succeeded in demolishing it. With that said, the subject of race continues to be a difficult and polarizing topic of discussion in contemporary American society. Christian Identists and rank and file members of the broader white supremacist movement stubbornly refuse to acknowledge the unity of humankind regardless of race. They reframe *Biblical* texts to suit their own racist purposes and buttress their beliefs with scientific data that, supporters of both Jensen and Rushton argue, was not meant to ignite fears and reproduce negative attitudes about nonwhite groups.

Hawaiian Religion

Regina Pfeiffer

Religious Studies, Chaminade University,
Honolulu, HI, USA

Sacred Spaces

Near the sandy shores of the Hawaiian Islands and up in their fragrant mountains exist remnants or restorations of ancient Hawaiian temples, *heiau*,

of which there were several types. Larger, sacrificial ones were known as *heiau-luakini*, dedicated to the god *Kū* (Malo 1951), the god of war. These could only be erected by a king or *mo'i* of an island and were the only ones at which a human sacrifice could be made (Mitchell 1992). A chief, *ali'i*, could erect a *heiau mapele*, dedicated to the god of agriculture *Lono* (Malo 1951). A third type, *heiau ho'ola*, was a healing site and was located in each district (Mitchell 1992). Although the Hawaiian religion officially was abolished by the monarchy in 1819, these various *heiau*, dedicated to a particular god, goddess, or purpose, still engender awe and respect from the Hawaiians who step lightly into their confines.

For the Hawaiians, though, sacred places included not only the *heiau* and *luakini* but also other significant locations that related to the religious and social system of the people. Among some of these sacred sites included Halema'uma'u Crater on the island of Hawaii where the goddess *Pele* dwelt; the birthing stones at Kukaniloko on Oahu where *ali'i*, royalty, had been born; and the places of refuge *pu'uhonua*, such as the one at Hōnaunau on Hawaii island where violators of the law or defeated warriors could seek sanctuary. The Hawaiian religious system not only consisted of beliefs in multiple and powerful gods and goddesses but also regulated the social system of the people that guided the customs and actions of the people. Sacred spaces are not so much architectural as natural, since Hawaiian religion is so much a part of soul in the natural world.

Kapu

Many aspects of the Hawaiians' lives were based upon the religious beliefs and system. "Every aspect of life was carried out in accordance with deeply implanted religious beliefs" (Mitchell 1992, p. 70). Fishing, planting, eating, healing, and playing were all aspects that connected directly to the gods and *kanāwai*, laws that governed the people. This system commonly has been referred to as the *kapu* system. *Kapu* means sacred or forbidden. Hence, the system identified

those aspects of life that were sacred, including persons, places, and events. Briefly, the foundation of the *kapu* system lay within the religious beliefs of the community, with its poly- and pantheistic focus that incorporated animistic tendencies that believed in the habitation of gods and goddesses in the natural surroundings. The *kapu* system first and foremost honored the gods and goddesses. It also kept the presence of the divine in the psyche. For example, since the *ali'i* (chiefs and chiefesses) not only represented but also were descendants of the divine, their persons and personal effects were guarded closely to maintain the *kapu*, the sacredness of the gods within them. Also, as the *ali'i* walked abroad, *māka'ainānā* (commoners) prostrated themselves and could not be close enough to be touched even by the shadow. Psychologically, the divine is present in the *kapu* and its *mana* (spiritual power) required boundaries.

Major Gods

All Hawaiians, whether chief or common people, worshipped four major gods: *Kū*, *Kane*, *Lono*, and *Kanaloa* (Malo 1951). *Kū*, as mentioned previously, was the god of war and also represented "the male generating power" (Mitchell 1992, p. 72). In addition, the rising sun was called *Kū*, and the third to sixth nights of the lunar calendar were named and sacred to him as well (Mitchell 1992). The second god in this pantheon was *Kane*, which means male. *Kane* was the creator of the world, according to Kepelino (2007). One of the names associated with *Kane* was that of *Kane* of the long night, *Kane-i-ka-pōloa*, because he dwelt alone in the darkness and created it (Kepelino 2007). From *Kane* also came light, heaven, and earth (Kepelino 2007). The third god in the pantheon was *Lono*, whose primary concerns were agriculture, fertility, and peace (Mitchell 1992). One major annual festival, *Makahiki*, was dedicated to *Lono*. Lasting for about four lunar months, beginning about mid-October, the *Makahiki* season was a time of rest for all Hawaiians. During this time, no work could be done; no war could be waged; regular religious

Kamapua'a](http://en.wikipedia.org/wiki/Kamapua'a)%27a

observances were suspended (Malo 1951). *Kanaloa*, the last of these four gods, was associated with the ocean and ocean winds and was also credited as being the god of the octopus (Mitchell 1992). “In the *Kumulipo*, *Kanaloa* is ‘Kahe’ehaunawela,’ the evil smelling octopus” (Mitchell 1992, p. 74). *Kamapua’a* (“hog child”) (Fig. 1) was fertility-god of agriculture associated with *Lono*. He was a trickster who pursued the goddess *Pele* persistently. His persistence transforms her hot lava into fertile soil (*Kamapua’a*).

Cosmic Genealogy

The *Kumulipo* was one of the many genealogical and cosmological chants of the Hawaiians. Hawaiians, like other Polynesian groups, had several cosmology stories. They had the narrative of *Papa* as Earth Mother and *Wakea* as Sky Father, but their version did not contain the Maori’s forceful separation of the primal parents. As with other Polynesian stories, Hawaiian cosmogony narratives did begin in darkness. Within the first few

lines of the *Kumulipo*, darkness, or night as it is translated, is the source of life. Psychologically this suggests an emergence of identity and awareness from the dark unconsciousness. As a religious image, the darkness from which life emerges indicates the vast cosmic depth of divine powers and the coming of human awareness:

Hanau ka pō – Did night give birth.

Hanau Kumulipo i ka pō, he kāne; Born was Kumulipo in the night, a male

Hanau Po’ele i ka pō, he wahine; born was Po’ele in the night, a female (Johnson 1981, p. 3)

This genealogical chant of more than 2,000 lines followed with a description of how the sea, its creatures, the rest of the natural world, and the human family began.

From the Ground

Still another Hawaiian cosmogony narrative recorded by Kepelino (2007) also begins in a darkness of deep intense night, when only the gods dwelt at this period, the gods of *Kāne*,

Kanaloa, and *Lono*. Furthermore, these mythic stories also included a symbolic growth of life, including human life, as emanating from the ground up. This is an image of identity and life coming from the sacred foundation of existence. A Hawaiian story from the *Naua* tradition related that *Wakea* had a child by *Ho'ohokulani* who was born not as a human being but as a *Lauloa* taro taproot. As the taro grew, *Wakea* named the stalk *ha loa* "long footstalk" (Kepelino 2007, p. 192). Later, when a child is born to them, the child is named *Haloa*. Kepelino (2007) wrote, "Now you must understand that the children born from *Haloa*, these are yourselves" (p. 192). The taro plant itself represented, therefore, each person's connection to the ancestors from below as the deep roots, the grandparents as the corn, the parents as stem, and the children as the leaves. As individuals grow older, their life cycle changes to grow downward to generativity as the major role to fulfill. Thus, psychologically, one's soul emerges from the ancestors underground and emerges from the ground up into a human body.

Care

Thus, the cosmogony myths provided a sense of identity and location in that the peoples themselves are directly descended from the gods who formed them and also provided the land itself. Because of this direct connection to the gods, the rest of human life was governed by a psychic relationship to the gods, the land, and each other. This psychic relationship was lived by maintaining proper relationships not only with the gods and goddesses but also among the people themselves. There existed a reciprocal relationship built upon a common understanding of the nature of the gods, goddesses, humanity, and the natural world lived as rooted in the land engendering a positive attitude that *mālama*, *care*, existed at all levels of the social structure and within one's personal life. Who one was and one's connection to others and the land depended psychically on this social system. Hence, a psychosocial understanding of human life was rooted

in religious beliefs, and its primary feeling is personal and social care.

Classes and *Mana*

The social system consisted several strata or classes of human existence, with the *ali'i*, the chiefs and chiefesses, as the highest stratum. They were believed to be descended directly from *na akua*, the gods, and had the greatest *mana* or spiritual power as a result. The direct descent from the gods meant that an *ali'i's mana*, if sustained, was *kapu* and sacred. Being near an *ali'i* meant being close to *na akua*, so much so that a safe physical distance was maintained.

The next stratum, the *kahuna* (plural form), was in charge of the religious life of the people and conducted the major religious ceremonies associated with various aspects of life, not just sacrifices to the gods. *Kāhuna* were experts in their particular fields, whether it was offering *pule*, prayers, to *na akua*, healing the sick, or selecting the best koa tree for building. Since the religious life was inseparable from daily life, the *kāhuna* offered the proper *pule*, prayers that were associated with an activity, often at the aforementioned *heiau* sites.

However, one kind of *kahuna* (singular form) instilled fear within the people. That was the individual *kahuna* '*anā* '*anā* who had the power to pray people to death. People believed in the *mana*, spiritual power, that this kind of *kahuna* possessed and carefully guarded their personal items, including fingernails and hair, so that the *kahuna* '*anā* '*anā* would not be able to pray them to death. This kind of *kahuna* was utilized to bring death to one's rival or enemy and psychologically was the archetypal shadow or the theological source of evil.

The largest stratum, the *maka'āinana*, was the laborer of fishing, planting, and building. While the people in this stratum outnumbered the *ali'i*, their fear of the retribution of the gods and goddesses in any breaking of a *kanāwai* and *kapu*, their recognition of the strength of the *ali'i's mana*, and their reliance on the knowledge and *pule* of the *kahuna* maintained the position in society to which the *maka'āinana* adhered. Even

after the influx of Westerners and later Christianity, the *makaʻāinana* would continue to show deference to the monarchs who led them.

‘Ohana

All these various social strata knew what their individual responsibilities were in regard to working with one another. A clear demarcation of life and duties with reciprocal responsibilities sustained the social system and provided persons with a sense of their identity in the overall culture. While later immigrants would consider Hawaiians to be lazy, “Hawaiians seek to nurture human relationships rather than to accumulate material wealth. Commitments to relatives and friends take precedence” (Linnekin and Poyer, p. 44). The religious and social system provided the foundation and basis for relationships that still exist for Hawaiians today, with their emphasis on *‘ohana*, family. Among Hawaiians, individualism and materialism were not the values consistent with the religious understanding of interconnectedness of humanity to one another and to the natural world. Hawaiians realized their personal identity only as part of the *‘ohana* that stems from the gods and goddesses themselves. Furthermore, this sense of interconnectedness extended to the ancestors. Even to this day although the *heiau* are not used as places of worship as before, offerings are left at *heiau* in honor and tribute to the ancestors who once believed in the gods and goddesses.

Healing

Thomas St. James O’Connor
Waterloo Lutheran Seminary, Waterloo, ON,
Canada

Introduction

Healing is a concept and experience that is used by many world religions and professional disciplines including medicine, psychotherapy, pastoral counseling, and family therapy. Parsons (2002) defines healing as the “restoration to wholeness.” Graham (1990) includes body, emotions, mental functioning, family and social relationships, and spiritual life in this restoration to wholeness. In the Hebrew Scriptures, healing is related to *shalom* (peace) and results from righteous living in accordance with the covenant (Graham 1990). Healing is linked to salvation. God is the author of all healing. Often sin is linked to illness and healing of illness occurs when there is reconciliation with God. The *Book of Job* in the Hebrew Scriptures is the exception to the notion of illness as a result of sin.

Some Religions and Healing

Within Islam, healing is based on the Qurʻan and is holistic, i.e., involves the whole person and includes the moral aspects of living (Isgandarova

2005). Muslim physicians were highly trained in the art and science of medicine and included the spiritual in their care for the patient. Avicenna (980–1037 CE) is one such doctor. The traditions (*hadiths*) of the Prophet Muhammad required the building of hospitals and care of the sick. Prayer and reading from the Qur'an are important Islamic practices of healing. In Hinduism, healing is seen as the restoration of balance. The science of medicine is known as the “science of longevity” (*ayurveda*). Illness occurs when the different elements of the body and one's life get out of balance. Healing is achieved through restoring balance involving the use of herbs and other remedies. In Taoism, illness is connected to the context and healing requires the achievement of integration both internally and externally.

In the Christian Bible, the ministry of Jesus involves healing. Many healing miracles stories are presented in the gospels. Pilch (1998), however, challenges the view that the healing miracles of Jesus are about cure. He argues that these healings are about new meaning and restoration of the ill person to the community. Healing in the Christian context involves the whole person as well as relationships in the community. Christians in the early centuries established hospices to care for the sick and pray for miracles. The focus was not on cure but on care. There is the belief that sin brings illness. Dedication to God and keeping the commandments brings health. However, there is also the notion that sickness could be part of God's plan and the ill were urged to offer their trials for their own sanctification and the sanctification of others. Some Christian denominations such as Roman Catholic and Anglican developed sacraments of healing (Sacrament of the Sick) to heal the sick both physically and spiritually.

Medicine and Family Therapy

As medicine developed in the Enlightenment period, a split took place between body and soul based on the philosophy of Descartes and Newton. Medicine addressed the body and religion addressed the soul and both sought healing. The

physician brought the cure of the body and the priest the cure of the soul. Clebsch and Jaekle (1967) note that healing is an important function of pastoral care and counseling within the Christian church. In modern medicine with the advance of antibiotics and other medical interventions, healing became synonymous with cure. The dualism of body and soul began to break down. Medicine became interested in the whole person and the view developed that the emotions, mind, and spirit are all integrated in the human person and could influence the health of the body. Sagar (2005) and Koenig et al. (2001) see religion/spirituality as offering healing to the body and mind. O'Connor and Meakes (2005) document an explosion of research and publication on the relationship between spirituality and health in healthcare journals. Medical research agrees that religion/spirituality can be an excellent coping mechanism for challenging health conditions. The more controversial issue is whether religion/spirituality can be a determinant of health and bring healing.

In family therapy, healing is viewed as restoring family relationships. Family therapy emphasizes a systems approach which sees the human person as part of a vast web of relationships. The focus is not so much on the individual but on the relational. Abuse, addictions, violence, disrespect can damage the web of relationships. Healing in these family relationships means striving to facilitate the I-Thou articulated by Martin Buber. Healing involves listening to each other, not being reactive, seeking the good of each other and forgiving. Strength-based and solution-focused approaches assume that there is a healing process within families that is part of their experience (Walsh 1998). Spirituality is one means to facilitate such healing (Walsh 2009). Rovers (2005) uses the theory of Bowen and Bowlby to heal the wounds between couples, and spirituality plays an important role.

Childhood Pain and Healing

There is some skepticism about healing the wounds that are experienced in childhood.

Therapy and life experience can uncover these wounds. The therapeutic relationship is one way of healing the pain and hurt. Bowen and Bowlby addressed the deficits in childhood that resulted from family relationships. Both thought therapy could be helpful but did not believe in total healing. The goal is to manage the pain and seek to develop better relationships as an adult. Pargament (1997) uses the term coping instead of healing in describing the impact of religion on challenging experiences. Coping involves conservation of one's identity and transformation of identity. In psychiatry, the development of new drugs has helped persons cope with depression, schizophrenia, mood disorders, etc. This biological approach is not viewed as healing the illness but rather helping the person manage and function with the illness.

In our post modern era, healing is experienced in multiple ways: psychotherapy, medical interventions, meditation, walking the labyrinth, prayer, reading sacred texts, talking to friends, exercise, rituals, family therapy, diet, using alternative medicines, silence, belonging to a community, etc. One of the challenges of our age is healing the animosity between groups. Religion and spirituality can work effectively with psychology and science in facilitating the restoration to wholeness (healing).

Heaven and Hell

Morgan Stebbins

Faculty of the New York C.G. Jung Foundation,
New York, NY, USA

Heaven and hell seem, at first glance, to be ubiquitous to religious systems. However, there are many ancestor- and spirit-based religions in which there is no such term and in which there is no concern for what happens after death or as a reward or punishment (Boyer 2001). However, in the major religious traditions with developed cosmologies, heaven and hell are described as both cosmological regions (the heavens, the abode of God) and representative of religious consequences. Psychologically heaven and hell refer to experiential states and can be found in common sayings such as “war is hell.”

Although the description and function of heaven and hell vary widely with religious

tradition, heaven is usually thought of as peace, bliss, or happiness and hell of course with suffering and punishment.

In the Hebrew Bible, the closest thing to a reference to hell (heb. *Sheol*) can be found in Isaiah (38:18), the Psalms, and Job (7:7), although since there was no concomitant conception of heaven (apart from as an abode of God and the heavenly beings), and since *Sheol* can well be translated as grave, there was not a highly differentiated idea of heaven and hell.

In the Hebrew bible, ideas of heaven and hell developed only very late, finding final form only in the Book of Daniel. Early on, Job comments scornfully that the dead “lie down alike in the dust” (21:26), indicating that it’s all the same after death. This conception changes slowly, until Psalm 73 identifies moral categories: the false are dispatched “far from thee” and the loyal “near God.” Finally in Daniel we find the introduction of the resurrection (12:20) and differential consequences – the good enjoy everlasting life, while evildoers suffer everlasting defeat. This all changes with medieval Jewish mystical speculation, especially in the Zohar. With the introduction of Kabbalistic traditions, we find a complex system of multiple heavens and their attendant angels.

By the time of the New Testament, however, Zoroastrian speculation had changed the vocabulary of heaven quite a bit. Not only that, very different types of places or experiences are implied by the different usages. For example, in the Gospels heaven is referred to in different places as “the great reward,” the “abode of the Father,” “life everlasting,” “paradise,” “the city of God,” “the kingdom of God (or Christ, or heaven),” and “the joy of God.” We can see in this a huge variety of meanings, especially when Jesus alternately refers to this state as “within you,” “among you,” and “according to your deeds” (cf. the kingdom of heaven (Matthew 5:3), ...of the Father (Matthew 13:43), life (Matthew 7:14), life everlasting (Matthew 19:16), the joy of the Lord (Matthew 25:21), great reward (Matthew 5:12), the kingdom of God (Mark 9:45), the kingdom of Christ (Luke 22:30), the house of the Father (John 14:2), city of

God (Heb. 12)). From a psychological point of view, we see the beginning of great differentiation of inner states which finds its apex in Dante’s *Divine Comedy*. In this work, Dante is concerned not so much with punishment but the mystery of how we injure ourselves (this is also the psychological meaning of sin). A saying in the Talmud runs, “The evils others do to me are as nothing compared to the evils I do to myself” (Blumenthal 2009). From this perspective hell is the experience of betraying one’s self and the price that is paid in the moment, not at some future point.

Other major religious traditions have very developed ideas about heaven and hell as well. There is a huge geography of heavens in Buddhist tradition. The *Vinaya* sutra describes seven hells and 26 heavens, each specific to a type of karma (not unlike Dante’s formulation). A central Buddhist concept (illustrated by the Bhavacakra mandala) involves the six worlds of rebirth – each represents the results of karmic past and run from the horrific world of hungry ghosts to that of demons, animals, humans, titans, and gods. Although being reborn as a human is not the highest karmic reward, it is the only realm from which one can attain nirvana (Webb 1975). This implies, psychologically, that being fully human is the optimum place from which to grow – regardless of idealizations or collective values.

In Chinese mythology, the concept of heaven was understood on one hand as a synonym of *Shangdi* (supreme deity) and on the other hand as a synonym for nature, especially the sky. Heaven was a state both attainable and manifested in the world and its rulers. The Chinese word for heaven, *Tian*, is a cognate of the name of the supreme deity, and Confucian theorists such as Mozi understood that while heaven is the divine ruler, the son of heaven (the King of Zhou) is the earthly ruler. In fact, heaven would be manifest on earth to the extent that the ruler lived according to the *Tao*.

The Qur’an explains that good deeds lead to an afterlife in Eden. Heaven itself is described in the Qur’an in verse 35 of Surah Al-Ra’d: “The parable of the Garden which the righteous are promised! Beneath it flow rivers. Perpetual is the fruits thereof and the shade therein. Such is the End of

the Righteous; and the end of the unbelievers is the Fire.” Since Islam rejects the concept of original sin, Muslims believe that all human beings are born pure. In Islam, therefore, a child who dies automatically goes to heaven, regardless of the religion of his or her parents. Furthermore, anyone who has worshipped no other god but Allah will go to heaven, thus including all Christians and Jews. However, there are many levels of paradise depending on how righteous a person is on Earth. The highest level that all Muslims are encouraged to ask for is *Jannatul Firdaus* (*The Belief in Heaven in Islam*).

The collective projection of what human behaviors lead to suffering changes over time and is always developing. The Vatican recently clarified the gender difference in the experience of heaven and hell. Men, apparently, will go to hell for the sin of lust and will suffer from burning brimstone. Women, on the other hand, will go to hell for the sin of pride and will be broken on the wheel.

In all of these traditions, we find a veritable taxonomy of psychological experience as well as a prognostic system: some hells are harder to recover from, some people are less likely to develop in this life, or will not develop at all. The question to ask is why these nearly ubiquitous other realms have been so widespread. There may have been a time when people genuinely feared the threat of eternal damnation, but a psychological view would look toward a combination of the world-shaping power of the imagination and the innate dissociability of the psyche as the factors which allow human beings to experience and describe very subtle or vague aspects of mind and to offer them in salient, that is, usually concrete form. This also explains why there is no end to metaphysical speculation, since there appear to be an ongoing (and so far untapped) geography of inner states.

Martin Heidegger (1889–1976) is considered by many as the founder of existential or hermeneutical phenomenology. Heidegger’s work has been a meeting place at the interstices between Daseinsanalysis (Binswanger 1967; Boss 1963, 1979), continental philosophy of religion (Caputo 1978; Crowe 2006), and existential theology (Tillich 1966; Bultmann 1953; Macquarrie 1999). Given how his work provides the convergence of these disciplines that result in an existential approach to psychology and religion, it behooves us to attune to Heidegger’s influence and inspiration for this field of study. What is more, Heidegger’s work is thoroughly inspired by his life story, a story that is a tapestry of religious moments and happenings that belie presumptions of his apparent atheism. Martin Heidegger’s place in the field of psychology and religion may surprise others who are more

likely to consider him as a continental philosopher.

Martin Heidegger was born in Messkirch, Germany, and raised as a Roman Catholic. His father was a sexton in the local parish. He studied theology at a Jesuit seminary in Austria and then at the University in Freiburg. Putting together his foundation in theological reflection with the genesis of his commitment to phenomenology as it relates to philosophical psychology, Heidegger wrote his dissertation, entitled *The Doctrine of Judgment in Psychology*, and later finished a thesis on Duns Scotus.

Although presumed to be an atheist, religiosity as a phenomenological experience was central to Heidegger's entire being and works. John Caputo (1978), John Macquarrie (1999), and more recently Benjamin Crowe (2006) have all written extensively on the mystical and religious elements in Heidegger's thought, as a biography about his life that also highlights this religious dimension for Heidegger appropriated titled, *Martin Heidegger: Between Good and Evil* (Safranski 1999).

The relation of Heidegger's work to other religious traditions beyond Christianity may also be surprising. Heidegger contributed to the translation of the Tao Te Ching, and much has been written about Heidegger's work in relation to Buddhism, Taoism, Hinduism, Christianity, and Judaism (Caputo 1978; Crowe 2006). Heidegger's contextual understanding of both situations or events and human existence was ripe for these kinds of comparisons between Heidegger's thought and the deep richness of the world religions. It was out of his religious interest that he came to philosophical psychology and the philosophy of existence, and it can be soundly argued that his religious interests never dissipated; they only morphed over his life as he continually tried to clarify them. His journey was his own variance of faith seeking understanding, but not a faith in propositional or doctrinal beliefs. Heidegger's faith was awaiting for the gift of Being's disclosure.

Much of Heidegger's work was written in his small hut lodged on the hillside of Todtnauberg in Germany's Schwarzwald. There, Heidegger grew more and more appreciative of, and adopted, the

simplicity of a peasant's lifestyle. He wore peasant clothing, cut his own wood, and believed the lack of distractions provided the best atmosphere for doing phenomenology. Not only did he write about dwelling *as* building, he lived it. In the *habitas* of his obvious ascetic proclivities, Heidegger's radical or hermeneutical phenomenology, and its subsequent destruction of metaphysics, offers profound implications for a deeper understanding of *homo religiosus*.

Hermeneutical phenomenology, pulsating with an ability to open up experiences beyond our typical ways of seeing events and things, offers an existential transcendence from static, mundane, and profane conceptions and comportments in existence to a more open and unfolding of Being. It is not just what one discovers that is transcendent, as the very *process* of interpretation itself that discloses authentic existence, or *Dasein*. *Dasein* is the showing of Being's presence in its coming to "be there" each moment of our lives (Heidegger 1962).

Dasein is not a fixed object or thing, as the ego or self is often understood, but the process of "clearing" in which human existence is understood. *Dasein* finds its ownmost possibilities when confronting its own death. By accepting one's finitude, facticity, and what Heidegger called "thrownness," we are freed to value and respond to harkenings for us to stand out in our own specificity and uniqueness in the world. Our ways of being-in-the-world find their significance in light of the circumstantial webs of meaning in any given instance, with each subsequent happening or event carrying its ownmost possibilities for us as enframed by our ever-present and inescapable being-unto-death.

Two Swiss psychiatrists, Ludwig Binswanger (1881–1976) and Medard Boss (1903–1990), brought Heidegger's work on *Dasein* to the attention of psychiatric medicine and later to clinical, phenomenological psychology in what became known as Daseinsanalysis, or existential analysis (Binswanger 1967; Boss 1963, 1979). Daseinsanalysis is practiced around the world, and has its organizational home in the International Federation of Daseinsanalysis, that includes countries such as Brazil, Greece, Belgium, France, Hungary, Austria, Canada, England, the

Czech Republic, and, of course, Switzerland. Moreover, it is not uncommon these days to see various international conferences addressing Heidegger's thought in relation to religious phenomena.

What is even more interesting from an existential-phenomenological understanding of the psychology and religion field is Heidegger's infamous "turn" during the period of his latter thinking and writing that led him away from a focus on *Dasein* in the world toward an analysis of *Ereignis*, or happening, event, or circumstance that gives rise to *Aletheia*, or the disclosure of truth. Truth, however, for Heidegger is the very disclosure of Being itself. One can hardly ignore the similarities with theological reflection on revelation. Furthermore, Heidegger's asceticism shows itself again in his invitation toward a meditative rather than calculative approach in understanding phenomena. *Gelassenheit* is called for, or releasement, thus allowing things to unfold in their time and uniqueness.

At the same time, admittedly, an initial view of Heidegger's being-unto-death certainly seems to preclude any otherworldly understanding of spirituality as the possibilities of metaphysical entities residing in a dualistic world. Yet, hermeneutically, even reflections on otherworldliness arise from the circumstantial "thrownness" in which we come to think of such matters. Nevertheless, I do believe Heidegger opens for us another understanding of spirituality that influenced many existential theologians, including Paul Tillich (1966), Rudolf Bultmann (1884–1976), John Macquarrie (1999), and Langdon Gilkey (1976), among others.

In one, concise summation of his relationship to spirituality, Heidegger believed that it is only through an understanding of transcendence do we come to a proper experience of *Dasein* (Heidegger 1977). This conviction locates him squarely, even if unwittingly, within the field of psychology and religion, albeit altering much of what we have heretofore understood about this field. Through Heidegger, we are offered a Daseinsanalytic perspective of psychology and religion.

Commentary

Perhaps Heidegger's typical absence from historical accounts of psychology and religion, apart from his destruction and overcoming of metaphysics, may be due to a cautionary ambivalence felt by most people regarding his unfortunate membership and participation in the Nazi party during World War II. Heidegger was strangely silent on this matter both during his membership and up to his own death. Nevertheless, Heidegger's position on these matters is notoriously complicated as he had deep and committed relationships with a variety of prominent Jewish scholars during this time, for instance, Hannah Arendt, Herbert Marcuse, Karl Lowith, and Hans Jonas, and he refused to appoint Nazis officials to administrative posts while rector at the University of Freiburg and openly disagreed with Nazi ideology on racial genetics and other matters, which resulted in being monitored by the Gestapo (Burston and Frie 2006). Heidegger eventually resigned from his appointment as Rector at the University of Freiburg, and withdrew from politics and much of public life, remaining silent on the whole affair. Nevertheless, it is hard pressed to find how Heidegger's life works on how the authentic life is lived by *not* succumbing to *Das Man*, or The They, could in anyway suggest a pro-fascist position. Again, similar to how Nietzsche's *Übermensch* was grossly and tragically misunderstood as a Aryan proposal, Heidegger's disclosure of *Dasein* in the event of existence was not an inaugural trumpeting for the Third Reich, the latter movement being the opposite of *Dasein* and more ominous than Heidegger himself even foresaw.

Heidegger leaves us with the possibility of understanding the field of psychology and religion from a Daseinsanalytic perspective. Paul Tillich's (1966) use of Heidegger to shift our understanding of God as *a* being to *Being* itself need not leave us with a false dilemma of choosing theism or atheism. For Heidegger, ontotheology has long since confused the ontic with the ontological or concrete things with the life that clears space for things to be-in-the-world. His destruction of metaphysics, as Benjamin

Crowe (2006) has pointed out, may very be influenced by Martin Luther's thought, particularly after Heidegger's break from Catholicism. What is specifically significant is the influence of Luther's *destructio* both on Heidegger's insistence on humanity's "throwness" as a conditioning of freedom and of the necessity of clearing space beyond the distractions of *Das Man*.

Finally, Heidegger shows us the inescapability of what I call our "enactments of significance" that are lived out every moment of our lives, which returns us to the hermeneutics of religiosity as well as the religiosity of hermeneutics. When we are left in situations in which Heidegger himself agreed that "only a god could save us," we can be certain that the saving god will be-in-the-world, clearing space and unburdening the heaviness of constricted existence so that we may share in *Dasein's* call toward authenticity and uniqueness.

Heresy

Clodagh Weldon

Dominican University, River Forest, IL, USA

From the Greek word *hairesis* meaning choice (and by implication that which is chosen by a faction of believers), heresy is that which emerges within the Church which is contrary to orthodox teaching as it has been revealed by God and is thus rejected by the Church as false or "heretical." Aquinas (1224–1274) describes heresy as a "species of infidelity" in which believers corrupt the dogmas of Christianity. Functioning like a gangrenous disease which infects the body, heresy subverts the faith of the Church and, from an orthodox standpoint, must be removed. Excommunication, military action, inquisitions, and burnings at the stake all feature as means of combating heresy in the history of the Church.

The New Testament exhibits a concern about emerging factionalism within the Christian movement and is replete with warnings about

“heresy.” Paul talks of divisions among early Christians in Corinth (1 Cor. 11:19) and warns the Church of Philippi “Beware of the dogs!” a reference to those who mutilate the faith. He warns believers in Jerusalem of “savage wolves,” men within their group who “will come forward perverting the truth” (Acts 20: 29–30). Peter also warns of “false teachers” who introduce “destructive heresies” and thus bring damnation upon themselves (2 Pet 2:1). In Tit 3:10, purportedly from Paul, we read of what should be done with a heretic: offer a first and second warning and then break off contact with the person. They are “perverted and sinful” and condemn themselves.

The word “heresy” gains ascendancy in the writings of the Church Fathers. In the second century, for example, Irenaeus of Lyons used the word “haireisis” to describe opponents whom he categorizes as those who did not hold to his “orthodox” beliefs.

Multiple examples of heresy emerge in the early Church, most of which focus around exaggerations of either the humanity or the divinity of Christ, the second person of the Trinity. The Docetists, condemned as heretics by Ignatius of Antioch (d.c. 107), taught that Christ was divine and only *seemed* to be human. Representing orthodoxy, Ignatius noted that if Jesus were not fully human, he would not have been able to save humanity. The Ebionites (also known as Adoptionists) taught that Jesus was the adopted Son of God. In response, Irenaeus of Lyons (d.c. 200) said that if Jesus were not “of God,” he could not have saved us. Arianism taught that Jesus is of like substance (*homoiousios*) to God the Father. The Council of Nicea (325 CE) condemned the Arian heresy and proclaimed that Jesus is of the same substance (*homoousios*) as the Father. As can be seen from these three examples, the emergence of heresy within the Church led not only to a condemnation of heretics but to a clearer articulation of Christian doctrine. This articulation finds its expression in the Creeds of the Church. An excerpt from the Nicene Creed, for example,

reads, “We believe in one Lord Jesus Christ, the only son of God, eternally begotten of the Father, God from God, light from light, one in being with the Father. . . .” The response to the heresies of Adoptionism and Arianism is clear: Jesus is not adopted, he is “eternally begotten of the Father, God from God”; he is not *like* God in substance but “one in being with the Father.”

Commentary

Freud has little to say about heresy, other than that it was condemned and punished by the Catholic Church. For Jung, on the other hand, heresy is much more important. He believed that heresy (as that which is rejected) needed to be reincorporated (“reintegrated”) in the interests of wholeness. He thought, for example, that the Christian doctrine of a Trinitarian God who is the *Summum Bonum* was deficient because it neglected the shadow side of the God image. Thus for Jung, that which had been rejected by orthodoxy as heretical because not in accord with revelation – such as the dark side of God – needed to be recovered and brought back to the whole.

Hermeneutics

Todd DuBose

The Chicago School of Professional Psychology,
Chicago, IL, USA

Hermeneutical Origins

Hermeneutics is the art and science of interpretation. Originally used to interpret texts, initially Biblical texts and then extended to other texts, hermeneutics evolved into not only a way to interpret literature but also a way to interpret any human experience. In fact, hermeneutics became known as a way to describe how existence works as a whole in that life is an undulating dance between concealment and revelation.

The etiology of the word, “hermeneutics,” is based on the mythical character, Hermes, the messenger, who delivered and interpreted messages from and between the gods. As hermeneuticists and historians Richard Palmer and Norman O. Brown have pointed out, Hermes was a trickster as well and known for his deception and thievery. Hermes stands in liminal space that is neither here nor there but a bridge between one place and another – though not identified with either one (Palmer 1969; Brown 1969). This description of Hermes is apt given the profound potential for bestowing blessings or wrecking havoc as a result of the interpretive process.

Hermeneutics, although addressed by figures as early as Plato and Aristotle, originated as a more formal practice with Rabbinic and Early Church Father concerns for how to interpret sacred scripture. Central to this debate was whether or not scripture should be interpreted literally or allegorically, particularly when application to contemporary concerns was an issue at hand. Adjudicating between conflicting allegorical understandings led to “rules” established for interpreting texts, thus leading to an exegetical approach to interpretation. Historical, contextual, literary, and grammatical frameworks became

privileged as essential contexts in which texts should be understood.

Medieval thought and debate led to the continuation of exegetical and allegorical analysis of symbolism, with annotations accompanying interpretations, thus facilitating better possibilities for lifestyle applications. During the Renaissance and Enlightenment, further exegetical tools were developed for use in interpretation, though this time expanding the purview of textual material to any secular text. Hermeneutics continued in this vein until the thought of Friedrich Schleiermacher (1768–1834). Schleiermacher saw the central task of hermeneutics as a guard against misunderstanding between the author’s intentions and the interpreter’s grasp of textual meaning. Empathy for the author’s intention, and aligning one’s own intentions and experience with that of the text, Schleiermacher thought, would lead to better understanding of the text’s meaning (Schleiermacher 1977).

Wilhelm Dilthey (1833–1911), though, proposed that understanding is best achieved when actual life situations are the focus of hermeneutical analysis. Hence, he saw hermeneutics as a method by which one could understanding the inner meanings of artifacts, actions, products, and experiences of others within human existence and, consequentially, argued that hermeneutics should be applied beyond texts to any human experience (Dilthey 1989). Dilthey also brought to our attention how mediated experience is for us and held firm to his conviction that we cannot understand inner meaning and experience related to any person, artifact, or text without moving through linguistic and cultural filters. These convictions prepared the ground for further developments in hermeneutics.

Martin Heidegger (1889–1976), one of Edmund Husserl’s (1859–1938) students, was highly influenced by Dilthey’s work, shifted the focus of hermeneutics beyond being a functional tool of interpretation, for texts or human experiences, and, instead, saw the hermeneutical process as descriptive of being itself (Heidegger 1962). The interpreter’s very existence is an enactment of

interpretation. The truth of one's existence unfolds in the interplay of call and response, of seeking to understand while also disclosing oneself to be understood. We are called to our "ownmost" possibilities and discover them only when we allow ourselves to be interpreted and delimited by our limitations, contingencies, and finitude in each moment of our lives. From the moment we rise from sleep, or even during sleep, we are perpetually interpreting experiences happening around us as well as unfolding ourselves to others in light of their inquiries and engagement with us.

Each significant piece of writing, text, expression, experience, action, or otherwise gains its disclosed meaning when seen against the backdrop of one's historicity or immediate enactment of one's life story. Moreover, Heidegger, furthering the Augustinian focus on faith seeking understanding, argued that only through our risked and invested pre-understandings within the delimitations of our horizons can we come to know anything. What can be known, though, is not something that can be isolated and held static, as being is perpetually becoming itself through the undulation of concealment and disclosure. Existence only partially discloses itself in any given moment and depends on solicitude or care and concern, to clear space for its further disclosure – which is never complete.

Hans-Georg Gadamer (1900–2002) integrated Heidegger's emphasis on the situatedness of meaning and Schleiermacher's emphasis on the importance of the interpreter's psychology for interpretation and saw the hermeneutical project as facilitating the meeting of horizons. Horizons are the capacities one has to understand, communicate, meaning make, and exist within the given historical and cultural traditions demarcating one's lived experience and perspective (Gadamer 1989). Horizons are inherently limited, thus necessitating dialog for truth to disclose itself. Hermeneutics as being, then, always and already discloses existence's inherent relationality.

Among other seminal figures in the history of hermeneutics, two other names stand out: Paul Ricoeur (1913–2005) and Jürgen Habermas (1929–). Ricoeur's utilized hermeneutics to integrate the field of semiotics with religious

experience (Ricoeur 1967). More specifically, Ricoeur sought to understand the existential modes of existence embedded in and mediated through religious symbolism, particularly symbols of sin and evil. Jürgen Habermas (1975), working from within the Frankfurt School of Critical Theory, utilized the power of hermeneutics to critique oppressed social structures and practices.

Hermeneutics in Psychology and Religion

Michel Foucault (1926–1984), Jacques Derrida (1930–2004), John Caputo (1940–), Hans Koegler, and Charles Winquist (1944–2002) have all offered various critiques and developments of hermeneutics. Foucault critiqued and reframed how power operates in discourse and relationships through genealogical and archeological analysis of various practices of control. Derrida deconstructed presumptions that discourse could fully represent meaning and experience, by exposing all that is missed in "presencing" practices (Derrida 1980). John Caputo further radicalized Derrida's deconstructive project by viewing deconstructive analysis as a type of religious experience that functions much like a type of negative theology or apophatic mysticism (Caputo 1987, 2000). Hans Koegler, a contemporary critical hermeneuticist, combines Foucaultian genealogy and Gadamerian hermeneutics to establish a critical hermeneutics that exposes oppressive power practices in relational patterning and dialogical discourse, thus allowing for horizons to meet without domination or submission. Finally, Charles Winquist established a practical hermeneutics in which he invites pastoral practices toward depth relating with others in contemporary cultural situations by allowing interpretations of story and symbol to take us toward deeper dimensions of existence (Winquist 1980).

Commentary

It is important in the field of psychology and religion that prior to hermeneutics being a way

of interpreting texts or human experiences, this art and science was, and still it, a process of “discernment” in general and a “discerning the spirits” in particular. Similarly, “diagnosis” is an art of “completely seeing through or into” another person or situation and also predates contemporary diagnostic practices by hundreds of years. Hermeneutics, therefore, is itself a sacred activity in that its very process unfolds being itself. What is often forgotten is that “divining,” from which the word “divine” arises, is an interpretive process. One could say that the divine, or sacred, is the process of hermeneutics itself. In this way, the experience of grace, then, is the experience of being truly understood.

Hermeneutics is not a mere “cognitive” activity of neocortical executive functioning, but a holistic comportment of desire that intends communion via the mutual grace of understanding and of being understood. What makes us homo religiosus is our never ceasing desire to understand, as Bernard Lonergan (1904–1984) noted, so that we can become discerning, interpreting, responsible, and loving human beings toward one another (Lonergan 1957/1992, 1973/1990).

Hermes

Lee W. Bailey
Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Hermes was a primordial Greek god, son of Zeus and Maia, a trickster and uncanny rogue, a night fellow, prince of thieves, phallic rascal, and lover

of nymphs (Ovid 1955, lines 269–290). This rogue symbolizes the clandestine violation of boundaries and laws. So he was the bad boy of proper society, the thief in the night, and the evasive sneak who bothered with no scruples. He had chthonic roots that were primitive and unheroic, known for evasion and invisibility. Yet he was also called *Argeiphontes*, a heroic “Argus slayer” for killing a monster with 100 eyes, to aid a maiden in a dispute between Jove and Juno (Ovid 1955, lines 591–780). His Greek presence was marked not by temples, but by herms, the upright phallic stone prisms marking boundaries.

He stole Apollo’s cattle but, pretending childish innocence, denied the whole thing. When Apollo caught him, he saw through his crafty lie. Yet Hermes charmed Apollo with his newly invented lyre and gave it to him, who then gave Hermes a magic golden wand and appointed him god of barter and cowherds. One of his more nurturing images is a youth carrying a ram over his shoulders. He was the guide of souls (*psychopomp*), to underworld Hades, but was also a phallic fertility figure (Homer 1976, Hymn No. 4). Rogues that both steal and bring new life still sneak about at night – that is, in dark shadowy unconsciousness.

For his clever, unscrupulous dodges with words, Hermes was also the god of psychological rhetoric, for the language of tricksters guides the wordsmiths of political speech writers inflating their client’s views, no matter how deceptive, and shooting attacks, no matter how manipulative, onto their opponents. Hermes guides public relations writers promoting a product without mentioning any flaws. He guides financiers devising deceptive schemes and all kinds of profitable trickery. And trickery is a basic part of military strategies.

Hermes, known in Rome as “Mercury” (that shiny, slippery, evasive metal), could put unsuspecting people to sleep or awaken sleepers (Ovid 1955, Pt. 2, lines 32–33). He was a bearer of dreams (Homer 1976, Pt. 4, line 14), so psychologically this evasive night fellow carries the unsuspecting sleeper down into the unconscious realm of dreams that baffle the proper Apollonian

ego-consciousness – or is he serving Apollonian consciousness?

When mythic Odysseus was on Circe’s island, she gave a potion to his sailors that turned them into swine. But Zeus sent swift Hermes to give a magic protective potion to Odysseus, to prevent him from becoming piggish. Hermes, of the golden staff [says to Odysseus]:

...your friends are here in Circe’s place, in the shape of pigs... Here, this is a good medicine [moly], take it and go into Circe’s house; it will give you power against the day of trouble. (Homer 1967, Pt. 10, line 277ff)

Here Hermes, in the magical depths of myth land, gives the lost heroic Odysseus the secret from a god of how to avoid becoming a beastly swine, under the spell of an enchantment. How many dangerous unconscious blunders could be avoided with knowledge of Hermes’ magic transforming potion? Here he serves the Apollonic divine, showing how to avoid the beast.

Hermes’ magical tricks take him across the chasm between many opposites, including life and death. At the end of the Trojan war, when the Achaians, led by Achilles, defeated the Trojans and killed Hektor, Zeus sent Hermes to soothe the enmity. Hektor’s grieving father Priam wanted to take a ransom of gold to Achilles to trade for Hektor’s body. But he dared not approach the Achaians without risking attack. So Zeus sent Hermes to work his magic and lead Priam across the boundary between the armies and ask Achilles to return his son’s defeated body. Zeus says to Hermes:

...go now on your way, and so guide Priam inside the hollow ships of the Achaians, that no man shall see him... immediately [Hermes] caught up the staff, with which he mazes the eyes of those mortals whose eyes he would maze, or wakes again the sleepers... (Homer 1951, Pt. 24, lines 335–344)

Hermes led Priam with “many treasures through the swift black night” (Homer 1951, Pt. 24, line 367) across the battlefield. He “drifted sleep on all, and quickly opened the gate ... and brought in Priam” (Homer 1951, Pt. 24, lines 445–447). Priam fell at the feet of Achilles and

both these calloused warriors wept for the immense slaughter they had inflicted (Homer 1951, line 509ff). Achilles granted Priam's wish and returned Hektor's body. Thus, Hermes brought together opposites and enabled the release and transformations of grief. Even today the urgency of returning the dead warrior's body home is still enacted in many a town's solemnly grieving ritual parades and burials of fallen warriors.

Jung (1956) saw in the trickster "the reflection of an earlier, rudimentary stage of consciousness" (p. 201). When cultures such as the Olympian Greeks reached a somewhat higher level of consciousness than the chthonic Titans that they threw into the underworld, they could tolerate the archaic trickster, and even give him a more refined, heroic place in the pantheon. But they could not eliminate his dark shadowy tendencies. He became both a bestial and divine being, bridging two collective psychic realms. He is not really evil, Jung says, but does foolish things out of unconsciousness. The trickster is a collective shadow figure that is surpassed in some ways, yet lingers in the slippery darkness of even supposedly advanced cultures. So the integration into consciousness of the rowdy, dangerous trickster shadow is a constant challenge.

Hermits

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

A hermit is a person who lives a solitary life as part of their spiritual path. The etymology comes from the Greek "eremos," meaning desert. This reflects the history of the hermit in the Christian tradition. The first Christian hermits sought out the solitude of the desert. Hermits generally live a monastic life, though not all monks are hermits. Some modern hermits in the Roman Catholic Church are lay people living solitary lives in their own apartments in the city.

Western hermits began living in desert regions in the third century of the Common Era, in Egypt and Syria. St. Anthony (251–356 CE) is among the most famous of the early desert fathers and mothers, men and women whose life of seclusion and self-denial marked the first Christian monastic tradition. Most, but not all, contemporary hermits are part of recognized monastic order in Christianity.

Judaism, with its emphasis on marriage and family life, does not have an eremitic tradition. Islam also does not have many hermits, though some Sufi mystics were known to be solitary wanderers.

In Eastern religions, there is also recognition of the value of the solitary life. Hindus have several orders of monasticism. "Sannyasa" refers to those who have taken vows to give up the secular household life and live celibately in community and sometimes in solitary states. The "sadhus" are

among the most widely known of sannyasi who often take up life as a solitary hermit. Buddhists also have monks who live off in long-term meditation retreat but are attached to the larger monastic community for their basic support. They periodically come out of retreat and engage in teaching meditation to monks in community or lay devotees. Taoism was founded by Lao Tzu who reputedly left his work, *The Tao Te Ching*, with a border guard as he walked off into the wilderness alone. So its founding figure was a hermit and through the ages others have followed his path of solitude. Confucianism, like Judaism and Islam, emphasizes the importance of family life, so it does not support a tradition of hermits.

It is difficult to live completely alone and be able to sustain oneself. Thus, most hermits are attached to either a lay community or a monastic community for sustenance and support. In the Christian tradition this is the difference between an anchorite (hermit) and a cenobite (monk living in community). St. Pachomius (292–348) is considered the founder of the communal tradition of monastic life in the Christian tradition. But as much as possible the hermit seeks solitude.

The eremitic life is a continuum of self-denial or asceticism, which can range from simple living with some comforts to strict discipline and practices involving self-mortification of the body. After practicing such harsh disciplines, Siddhartha Gautama decided that a middle way of ascetic practices was better and thus struck a new path as he became the Buddha, eschewing extreme practices but seeking simplicity and nonattachment.

The hermit was portrayed in the Rider-Waite Tarot deck as holding a lamp to illuminate his and other's paths. This symbolism affirms the primacy of the role of seeker after wisdom which is associated with gnostic traditions in the West as well as the more orthodox Christian forms of solitary life. There is a long tradition of solitary practitioners of Hermetic spirituality, including magicians, rosicrucians, and others in the Western esoteric tradition.

The “Great Man” View of History

It is commonly said that where in the twentieth-century impersonal forces were believed to make history, in the nineteenth century, heroic individuals were believed to make history. The epitome of this nineteenth-century outlook was the English man of letters Thomas Carlyle (1795–1881). Carlyle opens his *On Heroes, Hero-Worship, and the Heroic in History* (1841) with a statement that has come to epitomize the “Great Man” view of history: “For, as I take it, Universal History, the history of what man has accomplished in this world, is at bottom the History of the Great Men who have worked here” (p. 1).

Carlyle’s concern with outward accomplishment sharply distinguishes his conception of heroism from that of the German philosopher

Friedrich Nietzsche (1844–1900) in his *Thus Spoke Zarathustra* (1883–1885) (see part 1). The achievement of Nietzsche's *übermensch*, or "overman," is personal, not societal. Rather than praising the *übermensch* for changing his society, Nietzsche praises the society that produces him.

Carlyle's most vitriolic contemporary critic was the pioneering English sociologist Herbert Spencer (1820–1903), for whom the attribution of decisive events to the talents of individuals rather than to the fundamental laws of physical and social evolution is a hopelessly primitive, childish, romantic, and unscientific viewpoint. In Spencer's famous summary phrase in *The Study of Sociology* (1874), "Before he [the great man] can re-make his society, his society must make him" (p. 35).

The twentieth century has spawned still stronger skepticism toward the impact of heroes, even in the face of the seemingly all too real impact of dictators like Hitler and Stalin. Defenders of heroism nevertheless remain. Best known is the American philosopher Sidney Hook (1902–1989), author of *The Hero in History* (1943/1955). Hook argues for a sensible middle ground between crediting heroes with everything, which he assumes Carlyle to be doing, and crediting them with nothing.

Modern Heroes

Some heroes, or kinds of heroes, fit only certain periods. For example, it is hard to imagine an aristocratic hero like Don Juan surviving into the twentieth century. Other heroes do survive, either because their appeal continues or because they are protean enough to adapt to the times. Heracles, the greatest of ancient heroes, was by no means confined to the crude image of him as Rambo-like – all brawn and no brains – but on the contrary has been depicted as the embodiment of wisdom, the exemplar of virtue, a tragic hero, a glutton, and even a romantic lover.

In the twentieth century, as in prior centuries, not only have traditional heroes been transformed, but new heroes and new kinds of heroes have

emerged. If distinctively nineteenth-century heroes were the romantic hero (Byron's Childe Harold) and the bourgeois hero (Flaubert's Emma Bovary), distinctively twentieth-century heroes include the ordinary person as hero (Miller's Willy Loman), the comic hero (Roth's Alexander Portnoy), the schlemiel as hero (Singer's Gimpel the Fool), and the absurd hero (Beckett's Vladimir and Estragon). Far from divine, the contemporary hero is hopelessly human – mortal, powerless, amoral. The present-day hero is often lowly even within the human community – more the outsider than the insider, more the loser than the winner, and more the villain than the savior. The contemporary hero is not a once great figure who has fallen but a figure who never rises. Sisyphus, not Oedipus, epitomizes contemporary heroism. Yet Sisyphus is still to be commended for never giving up. Persistence replaces success; survival replaces achievement. Old-fashioned heroic virtues like courage and duty give way to new ones like irony and detachment. Today's hero is heroic in persisting without success.

Yet it would surely be going much too far to argue that traditional heroism has died out. Present-day heroes in sports, entertainment, business, and politics are admired for their success, not for their mere persistence, and the acclaim conferred on them often reaches the same divine plateau as in times past. They are "idolized" and "worshiped." At most, the notion of heroism as persistence has arisen alongside the traditional notion of heroism as success.

Hero Myths

Stories of heroes take the form of myths. The study of hero myths goes back at least to 1871, when, in *Primitive Culture*, the pioneering English anthropologist E. B. Tylor argued that many of them follow a uniform plot or pattern: the hero is exposed at birth, is saved by other humans or animals, and grows up to become a national hero. In 1928 the Russian folklorist Vladimir Propp, in *Morphology of the Folktale* (trans.

[1968] 1958), sought to demonstrate that Russian fairy tales follow a common biographical plot, in which the hero goes off on a successful adventure and upon his return marries and gains the throne. Propp's pattern skirts both the birth and the death of the hero.

Of attempts not merely to delineate patterns but also to determine the origin, function, and subject matter of hero myths, the most important have been by the Viennese psychoanalyst Otto Rank (1884–1939), the American mythographer Joseph Campbell (1904–1987), and the English folklorist Lord Raglan (1885–1964). Rank later broke irreparably with Sigmund Freud, but when he wrote *The Myth of the Birth of the Hero* (1909) [trans. 1914], he was a Freudian apostle. While Campbell was never a full-fledged Jungian, he wrote *The Hero with a Thousand Faces* (1949) as a kindred soul of C. G. Jung. Raglan wrote *The Hero* (1936) as a theoretical ally of James Frazer. Because Raglan's approach is nonpsychological and even anti-psychological, his will not be considered here.

Otto Rank

For Rank, following Freud, heroism deals with what *Jungians* call the first half of life. The first half – birth, childhood, adolescence, and young adulthood – involves the establishment of oneself as an independent person in the external world. The attainment of independence expresses itself concretely in the securing of a job and a mate. The securing of either requires both separation from one's parents and mastery of one's instincts. Freudian problems involve a lingering attachment to either parents or instincts. To depend on one's parents for the satisfaction of instincts or to satisfy instincts in antisocial ways is to be stuck, or fixated, at a childish level of psychological development.

Rank's pattern, which he applies to 30 hero myths, is limited to the first half of life. It goes from the hero's birth to his attainment of a "career":

The hero is the child of most distinguished parents, usually the son of a king. His origin is preceded by difficulties, such as continence, or prolonged barrenness, or secret intercourse of the parents due to external prohibition or obstacles. During or before the pregnancy, there is a prophecy, in the form of a dream or oracle, cautioning against his birth and usually threatening danger to the father (or his representative). As a rule, he is surrendered to the water, in a box. He is then saved by animals or by lowly people (shepherds) and is suckled by a female animal or by a humble woman. After he has grown up, he finds his distinguished parents, in a highly versatile fashion. He takes his revenge on his father, on the one hand, and is acknowledged, on the other. Finally he achieves rank and honors (Rank 1914, p. 61).

Literally, or consciously, the hero, who is always male, is a historical or legendary figure like Oedipus. The hero is heroic because he rises from obscurity to the throne. Literally, he is an innocent victim of either his parents or, ultimately, fate. While his parents have yearned for a child and abandon him only to save the father, they nevertheless do abandon him. The hero's revenge, if the parricide is even committed knowingly, is, then, understandable: who would not consider killing one's would-be killer?

Symbolically, or unconsciously, the hero is heroic not because he dares to win a throne but because he dares to kill his father. The killing is definitely intentional, and the cause is not revenge but sexual frustration. The father has refused to surrender his wife – the real object of the son's efforts. Too horrendous to face, the true meaning of the hero myth gets covered up by the concocted story. Rather than the culprit, the hero becomes an innocent victim or at worst a justified avenger. What the hero seeks gets masked as power, not incest. Most of all, who the hero is becomes some third party, a historical or legendary figure, rather than either the creator of the myth or anyone stirred by it. Identifying himself with the literal hero, the myth maker or reader vicariously revels in the hero's triumph, which in fact is his own. *He* is the real hero of the myth.

Literally, the myth culminates in the hero's attainment of a throne. Symbolically, the hero gains a mate as well. One might, then, conclude that the myth fittingly expresses the Freudian goal of the first half of life. In actuality, it expresses the opposite. The wish it fulfills is not for detachment from one's parents and from one's antisocial instincts but, on the contrary, for the most intense possible relationship to one's parents and the most antisocial of urges: parricide and incest, even rape. Taking one's father's job and one's mother's hand does not quite spell independence of them.

The myth maker or reader is an adult, but the wish vented by the myth is that of a child of three to five. The fantasy is the fulfillment of the Oedipal wish to kill one's father in order to gain access to one's mother. The myth fulfills a wish never outgrown by the adult who either invents or uses it. That adult is psychologically an eternal child. Having never developed an ego strong enough to master his instincts, he is neurotic. Since no mere child can overpower his father, the myth maker imagines being old enough to do so. In short, the myth expresses not the Freudian goal of the first half of life but the fixated childhood goal that keeps one from accomplishing it.

Joseph Campbell

Where for Freud and Rank heroism is limited to the first half of life, for Jung it involves the second half – adulthood – even more. For Freud and Rank, heroism involves relations with parents and instincts. For Jung, heroism in even the first half involves, in addition, relations with the unconscious. Heroism here means separation not only from parents and antisocial instincts but even more from the unconscious: every child's managing to forge consciousness is for Jung a supremely heroic feat.

The goal of the uniquely Jungian second half of life is likewise consciousness, but now consciousness of the Jungian unconscious rather than, as in the first half, of the external world. One must return to the unconscious, from which one has invariably become severed, but the

ultimate aim is to return in turn to the external world. The ideal is a balance between consciousness of the external world and consciousness of the unconscious. The aim of the second half of life is to supplement, not abandon, the achievements of the first half.

Just as classical Freudian problems involve the failure to establish oneself in the outer world, in the form of working and loving, so distinctively Jungian problems involve the failure to reestablish oneself in the inner world, in relation to the unconscious. Freudian problems stem from excessive attachment to the world of childhood, Jungian problems, from excessive attachment to the world one enters upon breaking free of the childhood world: the external world.

Just as Rank confines heroism to the first half of life, so Campbell restricts it to the second half. Rank's scheme begins with the hero's birth, Campbell's, with his adventure. Where Rank's scheme ends, Campbell's begins: with the adult hero ensconced at home. Rank's hero must be young enough for his father and in some cases even his grandfather still to be reigning. Campbell does not specify the age of his hero, but the hero must be no younger than the age at which Rank's hero myth therefore ends: young adulthood. While some of Campbell's own examples are of child heroes, they violate his scheme, according to which heroes must be willing to leave behind all that they have accomplished at home and violate even more his Jungian meaning, according to which heroes must be fully developed egos ready to encounter the unconscious from which they have largely become separated. Campbell's heroes should, then, be adults.

Rank's hero must be the son of royal or at least aristocratic parents. The hero of the egalitarian Campbell need not be, though often is. Where Rank's heroes must be male, Campbell's can be female as well, though Campbell inconsistently describes the hero's initiation from an exclusively male point of view. Finally, Campbell's scheme dictates human heroes, even though many of his examples are of divine heroes. Rank's pattern, by contrast, readily allows for divine as well as human heroes.

Where Rank's hero returns to his birthplace, Campbell's marches forth to a strange, new world, which the hero has never visited or even known existed. This extraordinary world is the world of the gods, and the hero must hail from the human world precisely to be able to experience the distinctiveness of the divine one. The hero has sex with the goddess and marries her – the reason the hero must here be male. He clashes with the male god and defeats him – the additional reason the hero must here be male. Yet with both gods he becomes mystically one and thereby becomes divine himself.

Where Rank's hero *returns* home to encounter his father and mother, Campbell's hero *leaves* home to encounter a male and a female god, who are neither his parents nor necessarily even a couple. Yet the two heroes' encounters are seemingly akin. But in fact they are not. Because the goddess is not the hero's mother, sex with her does not constitute incest. And the conflict with the male god is resolved.

When Campbell writes that myths "reveal the benign self-giving aspect of the *archetypal* father," he is using the term in its Jungian sense (Campbell 1949, pp. 139–140). For Freudians, gods symbolize parents. For Jungians, parents symbolize gods, who in turn symbolize father and mother archetypes, which are components of the hero's personality. A hero's relationship to these gods symbolizes not, as for Freud and Rank, a son's relationship to other persons (his parents) but the relationship of one side of a male's personality (his ego) to another side (his unconscious). The father and the mother are but two of the archetypes of which the Jungian, or collective, unconscious is composed. Archetypes are unconscious not because they have been repressed but because they have never been conscious. For Jung and Campbell, myth originates and functions not, as for Freud and Rank, to satisfy neurotic urges that cannot be manifested openly but to express normal sides of the personality that have just not had a chance at realization.

By identifying himself with the hero of a myth, Rank's myth maker or reader vicariously lives out in his mind an adventure that, if ever

directly fulfilled, would be acted out on his parents themselves. While also identifying himself – or herself – with the hero of a myth, Campbell's myth maker or reader vicariously lives out in the mind an adventure that even when directly fulfilled would still be taking place in the mind. For parts of the mind are what the myth maker or reader is really encountering.

Hero with an African Face

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Joseph Campbell's (1949–1967) classic *The Hero with a Thousand Faces* was built on Carl Jung's breakthrough theory of the collective unconscious and its mythic, psychological symbolism that appears in cultural forms such as folktales, literature, and religion and films such as *Star Wars*. Campbell inspired much popular and scholarly thinking about myth and comparative religion, and his "monomyth" theory of a single mythic overarching story has appealing echoes that link world mythic consciousness. But critics saw this theory as an insufficiently supported grab-bag of myths. Each fit into his archetypal paradigm about the ego's descent into the unconscious, encounters with various beings, notably divine, and a return to consciousness enriched with the wisdom of the collective underworld. He wrote his book during the late 1930s and published it after World War II, in 1949.

In the next decades, as world religion and myth studies expanded, partly due to his books, his earlier approach came to seem preliminary and lacking in scope. For example, he had not included the newly feminist approach to heroines and goddesses. So Maureen Murdock wrote *The Heroine's Journey* in 1990. Africana scholars called attention to more mythic themes in Africa, so Clyde W. Ford learned Swahili, travelled to Africa for extensive research, and wrote *The Hero with an African Face: Mythic Wisdom of Traditional Africa* in 1999. Ford sought to find African myths that can help heal the shadowy pain of African-American slavery. Such expansions of Campbell's theory can be seen either as the emergence into consciousness of new elements in Campbell's large archetypal theme, or alternate patterns.

Great Africa, with huge steaming jungles, thirsty deserts, and vast plains filled with exotic

plants, animals, and many kinds of people, has the distinction of being the birthplace of the human race, and thus the birthplace of many mythic heroic journeys. Most of North Africa is now primarily Muslim, and the south is a very diverse cultural region. But it can be divided into major regions by language families. The various mythologies of these regions are rich with themes such as creation, virgin birth, heroes, tricksters, magicians, death, and resurrection. These have roots going back as far as 30,000 years, deep in the human collective unconscious, far older than contemporary major religions. The regions are:

1. *The Nilo-Asiatic* region's mythology is primarily centered on Egyptian culture, especially the myths surrounding Isis and Osiris. Osiris was a dying and rising god, Isis was a wife and mother goddess who heroically retrieved Osiris from death. She is mother of Horus, Osiris' son who becomes his royal successor, despite the battle with Set, personification of evil. The Egyptian obsession with the afterworld divided the world into three realms: (a) the upper world of gods and goddesses, (b) the middle world of living beings, and (c) the underworld of departed souls, led by Osiris to their judgment and fate.
2. *The Nilo-Saharan* region, around the sources of the Nile and west of there, a high myth begins with the creation, in which Heaven and Earth were very close, connected by a rope. But humans neglected their responsibilities to the gods, so the rope was cut. This culture group has a high abstract divinity (*nihiatic* in Dinka) that envisions God far above all earthly images of divinity, as a state of being or a way.
3. *The Niger-Congo* (non-Bantu) region in the western Horn has very sophisticated and psychological mythologies of the gods. The Yoruba people have a rich pantheon of divinities (*orishas*) that express major archetypal patterns. In Bambara myth, the world emerges from and dissolves back into the root sound "Yo," similar to the Hindu "Om." The Dogon creation account emerges from a series of divine Words, and Dogon villages are laid out on a diagram of the human form, which is seen as a locale of oracles.
4. *The Niger-Congo Bantu* language region, around the Congo River and southeast, sees the sun and moon as expressions of immortality (Sun) and mortal consciousness (Moon). Their mythology is a rich collection of heroic journeys

that tell of dramatic adventures in the underworld of dead spirits, full of monsters, and the heavenly realm of divine figures.

5. *The Khoisan* region, in the southwestern Kalahari Desert, is comprised of the Khoi (Hottentots) and the San (Bushmen). In an important sacred ritual, entranced dancers report direct experiences of the divine. San rock art going back 30,000 years expresses ancient myths. Bushmen animal masters, such as the *mantis* and the *eland*, are prominent. (Ford 1999, p. xvii)

Campbell's comment, drawn from Jung's thinking that "Dream is the personalized myth, myth the depersonalized dream" (Campbell 1949–1967, p. 19), echoes the tradition of the Elgon people in central Africa. For them "little" dreams are not important, but "big" dreams require that the dreamer gather the community and tell it to them, thus opening the door to mythology (Ford 1999, p. vii). The people who live in a mythic world live in the soul's collective world. And myths often open into the realm of Being, the source of existence, as Jung showed. The symbolic language of dream and myth is many faceted and paradoxical, where numinous divinity can be expressed coming through a pond glowing with wondrous inner light or as a green tree goddess overflowing with love (Somé 1994). Myths can heal psychological and spiritual wounds such as the pains of slavery and despair. Sadly, slavery has been a terrible commonplace throughout history for conquered people, from Turkish or Chinese palace eunuchs guarding a harem to Africans picking cotton under the blazing sun, survivors of the 30–60 million slaves brought to the colonial Americans in one of the worst holocausts in history.

How can mythology help assuage the blood and grief of such slavery? The theme of a hero's journey points to the inward passage from soul-breaking misery to a heroic consciousness cultivated by stories told, sung, and danced around campfires that can conquer evil and bring hope. Myths and masks can transport and transform souls. They can teach courage and orient the soul to its higher destiny, its part in the greater mysteries of existence. Today, the BaKongo people tell stories of their ancestors captured and sold

Hero with an African Face, Fig. 1 Ritual mask. Fang people. Gabon, west-central Africa. Louvre Museum. (Photo by Marie-Lan Nguyen (2006). Public Domain (http://en.wikipedia.org/wiki/File:Fang_mask_Louvre_MH_65-104-1.jpg))

to white men in ships. It is said they were taken first to the realm of Mputu. This refers to "agitated waters," to Europeans, and to the land of the dead. It is seen as the mythic realm where heroic souls travel to battle magical beings. And they had to endure white-faced masters with whips and a male God imagined to be white. But from there each heroic soul is not lost. It is brought home and reborn in the cycles of life and death. "We're waiting for them," the BaKongo say (Ford 1999, pp. 5–6) (Fig. 1).

African Creation

The vast ancient origin of the universe hides deep in mysterious cosmic energies. Religions seek to give answers to this archetypal question beyond rational or empirical knowledge, if not literally, then as psychological and spiritual foundations of the deepest layer of life. Myths of creation are

commonly reenacted annually to keep creation going or to keep the archetypal image in consciousness. For example, annual rituals repeat a primeval myth of creation by egg, tree, or breath, returning to “yonder time” (*in illo tempore*) thus regaining and keeping that creative energy going (Eliade 1958, pp. 410–417; Ford 1999, pp. 170–191). The African Bambara of Mali commonly chant “Yo” because they believe that the universe began with this sound, this energy, and continues as the ground of existence. So to chant “Yo” is to harmonize with the deep songs of one’s being, the origin of all the planets, life-forms, and consciousness. This is a sophisticated philosophical intuition of participation in cosmic depth that gives a solid ground to the collective Bambara life journey. It also raises the psyche above the cruder aspects of its archetypal strivings up to refined presence. Primordial divinities such as the biblical God create the world by speaking words, and primordial heroes such as the Chinese “Heavenly Emperor” Fu Hsi create culture. The Hindu original and ever-present “Om” is the primordial creative word full of wisdom (Campbell 1949/1967, pp. 315–317). The Nigerian Yoruba hear the creative cosmic word as “Hoo.”

African Heroic Journeys

The patterns of African mythology often reflect themes highlighted by Campbell, but not in his “monomyth” order. His hero crosses a first threshold, with complications, such as resistance and a threshold guardian. Ordinary ego consciousness is then left behind and the soul enters a mysterious Wonderland, for “myth is the secret opening through which the inexhaustible energies of the cosmos pour into human cultural manifestation” (Campbell 1949–1967, Prologue, Part 1, “Myth and Dream,” pg. 3). The story of the South African Zulu hero Uncama begins with him crawling down a hole chasing an animal and entering an underworld symbolizing the collective unconscious *mosima*, the abyss where the dead dwell. He crosses the threshold into myth-land, where dynamic creatures come alive and guide souls.

In Angola, the Ambundu people tell of a culture hero whose father called his son Kimanaeuze to go on a journey. When he returned, all his family and property had been destroyed by an enemy, the Makishi, but his wife had survived, and they started a family again. Their first child Sudika-mbambi at birth was miraculously able to speak, saying “In the sky I set an antelope.” This miraculous birth was immediately followed by a second son, saying: “I am Kabundungulu. . . . You will see all the miraculous things that I am going to do.” And he led spirits of nature to build a new house for the family (Ford 1999, pp. 29–30). The tragic suffering of defeat and loss gives way to new beginnings with miraculous powers. This is the hope that lifts the hearts of victims, the magic of myth’s sparkling ability to raise the soul from earthly suffering to see the powerful transcendent saving “antelopes” in the sky.

The Soul’s Great Adventure

Once past the threshold and its ordeals, the heroic journey begins in the realm of the gods and mythic creatures. These may have no “objective” existence, for their enchanted realm lies below the subject-object dichotomy. But they serve to dramatize the soul’s and the culture’s need for transformation, to overcome life’s challenges, such as suffering, anxiety, or despair. Today, even apparently totally technological events, such as the journey to the outer space, have mythical purposes deeper than their rational surface ego motives, such as “progress,” technological, and national pride. The Chaga people in Tanzania tell of Kyazimba, a poor man whose life felt hopeless. He encountered an old woman who, when he told her his problem, wrapped her robe around him, soared with him above the earth to the zenith of the sun’s daily journey at midday. A brilliantly shining chief came up and prepared a feast. The old women asked for his help for Kyazimba. The chief blessed the man and sent him back to earth and a prosperous life (Ford 1999, pp. 53–54).

Another major African theme is the Sacred Union, a transcendent marriage of a mortal to a

divinity that produces a miraculous birth of a culture hero.

In Rwanda the tale is told of the wife of Kwisaba, whose husband was away at war for so long that she finally fell ill with despair and collapsed, unable even to chop firewood. She cried out for the help of someone, even the Thunder of Heaven. Suddenly her hut darkened, clouds gathered above, and in a flash of lightning appeared the Thunder of Heaven, in the likeness of a man. He chopped all her firewood in an instant, lit her fire, and said, "Now what will you give me?" She was struck silent, but soon he said, "When your girl baby is born, will you give her to me for a wife?" Trembling, she stammered "Yes!" and Thunder disappeared. Her daughter was born and named Miseke. Her human father returned home and commanded her to stay inside to avoid the return of Thunder. But she could not be restrained and played outside. Soon when she laughed, to everyone's astonishment, beautiful, valuable beads dropped from her mouth. Soon Thunder returned and claimed her for his wife and carried her above. She soon overcame her fear and loved her husband and had children. But she yearned to return to her earthly family, and Thunder granted her wish. She encountered adventures and challenges there. A friendly boy killed an ogre that had swallowed her children, and she took them back to their heavenly home, never to be seen again on Earth.

There are several important archetypal themes in Miseke's story, such as a powerful sky god, mating, divine child, soul transformations, and overcoming suffering (Campbell 1949–1967, Pt. II, Chaps. 2 and 3; Eliade 1958, Chaps. 2 and 7; Jung 1979, Vol. 16, para. 214). Her mother was saved by a transcendent figure who "cut her wood" and "lit her fire" with his "axe." She miraculously gave birth to a half-divine child when the father was away. As she grew, from her happiness emerged beautiful jewels, like little eggs. She was initiated into marriage and had heavenly children. Then she struggled with earthly troubles until rescued by a heroic boy, then returned to heaven. This myth gives mothers and girls fruitful symbolic images to prepare them for their successful heroic journey as adolescents, wives, and mothers

and in touch with their higher power, like Thunder (Ford 1999, pp. 52–59).

African Goddesses

In traditional African culture, goddesses are complex and take many forms. They are not so much carved images as powers experienced in nature – reproduction, stars, plants, rivers, or serpents. They are the transcendent power behind nature imagined as feminine, such as Gleti, a moon goddess and mother of all the stars in Dahomey tradition in Benin. In Yoruban tradition in Nigeria, Oba is the Orisha spirit of the River Oba. In South African Zulu culture, Malambo is the snake-like goddess of rivers. In Ethiopia, Buk is goddess of women's fertility, and Atete is goddess of Spring and fertility. For the Southern Nuba of Sudan, the "Great Mother" gave birth to Earth and humanity. The Fon of Dahomey envision a 4-day creation through Mawi, who had the assistance of Aido-Hwedo, the Great Serpent, who helped her and ended coiled, tail in mouth, as a carrying pad under the Earth. This circular serpent image is the widespread archetypal image of the *uroboros*, symbol of the endless round of birth, life, and death. African goddesses are often paired with male figures, such as Mwetsi, the creator figure Wahungwe people of Zimbabwe. When he touched the creatrix goddess Massassi (the morning star) with a drop of oil, she swelled and gave birth to plant life. His second wife Morongo (the evening star) coupled with Massassi and she gave birth to chickens, sheep, goats, boys, and girls. Later she gave birth to lions, leopards, snakes, and scorpions. The snake brought them trouble and death, and they returned to Disvoa, the heavenly realm (Ford 1999, pp. 114–132). Isis was the great goddess of Egypt who, with her husband Osiris and son Horus, symbolizes many archetypal themes, such as culture bringing, birth, death, and resurrection. The goddess in Africa may also appear as half of an androgynous figure.

Many other archetypal heroes with transcendent powers fill African myth, such as the sacred warrior, the master animals, and the divine self. But intuitively, many people understand that

divinity is beyond human form or gender, for it makes both. Rituals, especially initiations, shape the consciousness of traditional Africans to experience and know these many divinities (Somé 1994). The African hero is one image of the supreme power, the fathomless spirit, the ontological mystery that creates Earth and the cosmos, with their many wonders, and is present in its many guiding forms and healing dynamics.

Heroine's Journey, The

Maureen Murdock

Pacifica Graduate Institute, Carpinteria, CA, USA

In 1949 Joseph Campbell presented a model of the mythological journey of the hero in *The Hero with a Thousand Faces*, which has since been used as a template for the psycho-spiritual development of the individual. This model, rich in myths about the travails and rewards of male heroes like Gilgamesh, Odysseus, and Percival, begins with a Call to Adventure. The hero crosses the threshold into unknown realms, meets supernatural guides who assist him in his journey, and confronts adversaries or threshold guardians who try to block his progress. The hero experiences an initiation in the belly of the whale, goes through a series of trials that test his skills, and resolves before finding the boon he seeks – variously symbolized by the Grail, the Rune of Wisdom, or the Golden Fleece. He meets a mysterious partner in the form of a goddess or gods, enters into a sacred marriage, and returns across the final threshold to bring back the treasure he has found (Campbell 1949, pp. 36–37).

The hero's journey is a search for one's soul and is chronicled in mythologies and fairy tales throughout the world. This quest motif does not, however, address the archetypal journey of the heroine. For contemporary women, this involves the healing of the wounding of the feminine that exists deep within her and the culture.

In 1990, Maureen Murdock wrote *The Heroine's Journey: Woman's Quest for Wholeness* as a response to Joseph Campbell's model. Murdock, a student of Campbell's work, felt his model failed to address the specific psycho-spiritual journey of contemporary women. She developed a model describing the cyclical nature of the female experience. Campbell's response to her model was, "Women don't need to make the journey. In the whole mythological tradition the woman is *there*. All she has to do is to realize that *she's* the place that people are trying to get to" (Campbell 1981). That may be true mythologically as the hero or

Heroine's Journey, The,
Fig. 1 The Heroine's
 Journey

The heroine's journey begins with "Separation from the feminine" and ends with "Integration of masculine and feminine."

heroine seeks illumination, but psychologically, the journey of the contemporary heroine involves different stages.

The Heroine's Journey begins with an initial separation from feminine values, seeking recognition and success in a patriarchal culture, experiencing spiritual death, and turning inward to reclaim the power and spirit of the sacred feminine. The final stages involve an acknowledgment of the union and power of one's dual nature for the benefit of all humankind (Murdock 1990, pp. 4–11). Drawing upon cultural myths, Murdock illustrates an alternative journey model to that of patriarchal hegemony. It has become a template for novelists and screenwriters, shining a light on twentieth-century feminist literature.

The Heroine's Journey is based on the experience of fathers' daughters who have idealized, identified with, and allied themselves closely with their fathers or the dominant masculine culture. This comes at the cost of devaluing their personal mothers and denigrating values of the female

culture. This occurs for both men and women if not on a personal level, then certainly on a collective level. If the feminine is seen as negative, powerless, or manipulative, the child may reject those qualities she associates with the feminine, including positive qualities such as nurturing, intuition, emotional expressiveness, creativity, and spirituality. On a cultural level, the separation from the feminine results from a reaction to images of the feminine presented by the media that are impossible to identify with or because of a lack of feminine imagery in religion.

Gods and goddesses are often seen as diverse ways of being in the world and the ancient goddess Athena symbolizes the second stage of *The Heroine's Journey*. This Greek goddess of civilization sprang full grown from the head of her father, Zeus. Her mother Metis had been swallowed whole by Zeus, thus depriving Athena of a relationship with her mother. This stage involves an identification with the masculine but not one's inner personal masculinity. Rather, it is

the outer patriarchal masculine whose driving force is power. An individual in a patriarchal society is driven to seek control over themselves and others in an inhuman desire for perfection.

The young girl may see the men and the male's world as adult and becomes identified with her inner masculine voice, whether that is the voice of her father, God the Father, the professional establishment, or the church. Unfortunately, masculine consciousness often tries to help the feminine to speak; it jumps in, interrupts, and takes over, not waiting for her body to know its truth.

The next stage, like the hero's journey, is the road of trials where the focus is on the tasks necessary for ego development. In the outer world, the heroine goes through the same hoops as the hero to achieve success. Everything is geared to climbing the academic or corporate ladder, achieving prestige, position and financial equity, and feeling powerful in the world.

However, in the inner world, her task involves overcoming the myths of dependency, female inferiority or deficit thinking, and romantic love. Many females have been encouraged to be dependent, to disregard their needs for another's love, and to protect another from their success and autonomy.

We live in a society dominated by a masculine perspective where the feminine is perceived as less than the masculine. The mother tongue, the language of experience and body knowing, is not seen as valid as the father tongue, the language of analysis. In some families, cultures and religions, being born in a female body is second rate; the female child has therefore failed from the beginning and is marked psychologically as inferior solely because of her gender. In this century, the foremost moral issue, from the third world countries to the leading world powers, is the abuse and oppression of women and girls around the globe.

The myth of romantic love is that the other will complete her life whether the other is a husband, lover, son, ideology, political party, or spiritual sect. The attitude here is that the "other" will actualize her destiny. This stage is symbolized by the myth of Eros and Psyche.

The first part of *The Heroine's Journey* is propelled by the mind and the second part is in

response to the heart. The heroine has been working on the developmental tasks necessary to be an adult, to individuate from her parents, and to establish her identity in the outer world. However, even though she has achieved her hard-earned goals, she may experience a sense of spiritual aridity. Her river of creativity has dried up and she begins to ask, "What have I lost in this heroic quest?" She has achieved everything she set out to do, but it has come at great sacrifice to her soul. Her relationship with her inner world is estranged. She feels oppressed but does not understand the source of her victimization.

At this stage, she is afraid to look into the depths of herself and clings instead to past patterns of behavior, old relationships, and a familiar lifestyle. There's a fear of saying "no" and holding the tension of not knowing what's next. In *Leaving My Father's House*, Jungian analyst Marion Woodman (1992) writes,

"It takes a strong ego to hold the darkness, wait, hold the tension, waiting for we know not what. But if we can hold long enough, a tiny light is conceived in the dark unconscious, and if we can wait and hold, in its own time it will be born in its full radiance. The ego then has to be loving enough to receive the gift and nourish it with the best food that new life may eventually transform the whole personality." (p. 115)

At this point, the heroine is faced with a descent or dark night of the soul, a time of major de-structuring and dismemberment. A descent brings sadness, grief, a feeling of being unfocused and undirected. What usually throws a person into a descent is leaving home, separating from one's parents, the death of a child, lover or spouse, the loss of identity with a particular role, a serious physical or mental illness, an addiction, the midlife transition, divorce, aging, or loss of community. The descent may take weeks, month, and years and cannot be rushed because the heroine is reclaiming not only parts of herself, but also the lost soul of the culture. The task here is to reclaim the discarded parts of the self that were split off in the original separation from the feminine – parts that have been ignored, devalued, and repressed and words and feelings swallowed in her quest for success.

Dismemberment and renewal is a key feature of the ancient Sumerian myth of Inanna and Ereshkigal. Inanna, the Queen of the Great Above, journeys to the Underworld to be with her sister Ereshkigal, the Queen of the Great Below. Ereshkigal's consort has died and Inanna traverses seven thresholds and seven gates to be with her sister in her grief. At each gate, she divests herself of symbols of her power. When she reaches the Underworld, Ereshkigal fixes her with the eye of death and hangs her on a peg to rot. Inanna sacrifices herself for the earth's need for life and renewal. Her death and subsequent return to life predates Jesus Christ's crucifixion and resurrection by 3000 years.

At this stage in *The Heroine's Journey*, a woman seeks to reclaim a connection with the sacred feminine to better understand her own psyche. She may become involved in research about ancient goddess figures such as Inanna, Ereshkigal, Demeter, Persephone, Kali, or the Marian mysteries. There is an urgent yearning to reconnect with the feminine and to heal the mother/daughter split that occurred with the initial rejection of the feminine. This may or may not involve a healing with one's personal mother or daughter, but it usually involves grieving the separation from the feminine and reclaiming a connection to body wisdom, intuition, and creativity.

The next stage involves healing the unrelated or wounded aspects of her masculine nature as the heroine takes back her negative projections on the men in her life. This involves identifying the parts of herself that have ignored her health and feelings, refused to accept her limits, told her to tough it out, and never let her rest. It also involves becoming aware of the positive aspects of her masculine nature that supports her desire to bring her images into fruition, helps her to speak her truth and own her authority.

The final stage of *The Heroine's Journey* is the sacred marriage of the masculine and feminine, the *hieros gamos*. A woman remembers her true nature and accepts herself as she is, integrating both aspects of her nature. It is a moment of recognition, a kind of remembering of that which somewhere at the bottom she has always

known. The current problems are not solved, the conflicts remain, but one's suffering, as long as she does not evade it, will lead to a new life. In developing a new feminine consciousness, she has to have an equally strong masculine consciousness to get her voice out into the world. The union of masculine and feminine involves recognizing wounds, blessing them, and letting them go.

The heroine must become a spiritual warrior. This demands that she learn the delicate art of balance and have the patience for the slow, subtle integration of the feminine and masculine aspects of her nature. She first hungers to lose her feminine self and merge with the masculine, and once she has done this, she begins to realize this is neither the answer nor the objective. She must not discard nor give up what she has learned throughout her heroic quest, but view her hard-earned skills and successes not so much as the goal but as one part of the entire journey. This focus on integration and the resulting awareness of interdependence is necessary for each of us at this time as we work together to preserve the health and balance of life on earth (Murdock 1990, p. 11).

In the Navajo Creation Story, Changing Woman speaks to her consort the Sun:

Remember, as different as we are, you and I, we are of one spirit. As dissimilar as we are, you and I, we are of equal worth. As unlike as you and I are, there must always be solidarity between the two of us. Unlike each other as you and I are, there can be no harmony in the universe as long as there is no harmony between us. (Zolbrod 1984, p. 275).

Heschel, Abraham Joshua

Mark Popovsky
Department of Pastoral Care, Weill Medical
College of Cornell, New York Presbyterian
Hospital – Chaplaincy, New York, NY, USA

General

Born in Warsaw, Abraham Joshua Heschel (1907–1972) was designated from his youth as the heir to the great Hasidic court of Apt over which his father and grandfather before him had presided. Following a rigorous traditional Jewish education, Heschel enrolled at the University of Berlin in 1927 where he earned a doctorate in Bible while simultaneously studying at a liberal rabbinical college devoted to the critical study of religious texts. Heschel remained in Berlin through the 1930s writing poetry in Yiddish, publishing scholarly works in German, and teaching at a number of Jewish institutions during the rise of Nazi power. German officials deported Heschel to Poland in 1938, where he taught briefly before escaping to America via England. His mother and two sisters were killed in the Warsaw Ghetto in 1941. Heschel moved to New York in 1945 where he taught for the remainder of his life at the Jewish Theological Seminary, publishing several major works of theology both in Hebrew and English.

Theology

Heschel believed in a God intimately concerned for human beings. He rejected the Aristotelian view of God, which had entered Jewish thought through Maimonides, as a Prime Mover who himself is not moved. Instead, Heschel laid out a theology of divine pathos in which God is deeply affected by human actions. God, in Heschel's view, reaches out to form relationships with human beings, but humans often ignore God's overtures, blinded by arrogance and a fatal underestimation of our own limitations. Faith begins with humans recovering a sense of awe – an awareness that God is present around us and challenging us to appreciate the ineffable mystery of existence.

Heschel elevated theological concepts such as awe, wonder, and mystery in his writing. Consequently, he was profoundly skeptical of social sciences that selectively ignore those aspects of human life not easily quantified or described in scientific language. He criticized the psychology of his day for its “empirical intemperance” which dismissed questions about ineffable dimensions of existence. He also rejected the idea that religion reflects human beings' need to believe in God. Conversely, Heschel wrote that religious feelings arise as individuals become aware of God's need for them. Heschel consistently maintained that evil acts were rooted in human egocentricity. He accused psychology of “intellectual narcissism” to the degree that it placed ultimate confidence in the power of the mind, dismissed questions of morality, and professed that man can attain his own salvation without resort to God.

Heschel also strongly critiqued religious orthodoxies which mistakenly view ritual piety as an end in itself. While Heschel was traditionally observant in his own life and wrote several moving works about the importance of observances such as prayer and the Sabbath, he understood religious rituals as a spiritual tool to help one continuously redirect his or her attention back towards the mystery of God's presence. Heschel simultaneously argued that ritual observance itself, even in the absence of belief, can help to

open the individual's consciousness up to God's intimate love for humanity. Heschel famously wrote that Judaism does not demand a leap of faith but rather a leap of action.

Heschel refused to interpret the Bible as a document describing historical events. He wrote that scripture is not the object of divine revelation but rather a human commentary on revelation itself. The biblical text represents not what God said but rather a human effort to render into words a genuine experience of the divine which far transcends logic and language. Heschel read the prophetic message as demanding that individuals actively engage in a relationship with God by behaving morally and by developing an awareness of the sacred. In his own life, Heschel interpreted this to require his active participation in the American Civil Rights movement and his protest of the Vietnam War.

Hestia

Susan Wyatt
Antioch University, Los Angeles, CA, USA

In Greek mythology, Hestia was the firstborn of Cronus (Saturn) and Rhea. Since it had been prophesied that one of his sons would overthrow him, Cronus swallowed each of his children; first Hestia, then Demeter, Hera, Hades, and Poseidon.

When Zeus, her third son, was born, the infuriated Rhea hid him and gave Cronus a stone to swallow. When Zeus grew to manhood, he forced Cronus to disgorge his brothers and sisters. Hestia, the first to be swallowed, was the last to be released.

Hestia, like her Roman counterpart Vesta, is best known as the Goddess of the Hearth. While she was sometimes portrayed in human form, she was more often represented by images of flames or glowing coals. She had the most awesome responsibility of the Olympian gods. She became involved in none of the caprices and disputes that characterized her family because she was the one charged with keeping the flame alive, reminding us of the critical dependence of early humans on fire. It was Hestia who invented the art of building a house as a place to safeguard the flame and contain its light and warmth. She eschews the blood sacrifice; her preferred offering is sweet wine. She obviates the need for humans to steal fire because she gives it freely as a gift.

Hestia is one of the Goddesses that Jean Bolen used in her explication of archetypal feminine patterns. She represents an inward focus in a woman's psyche. Her identity is not tied to external circumstances or to outcomes. She looks inside herself to find meaning, peace, sanctuary, and the sense of being related to others in a common spiritual bond. Her focus is on the inner flame, her own values and what is personally meaningful to her. Her concern is with the spiritual, with being centered and being connected. She stays in the background, seeking anonymity, tranquility, and solitude.

As the Goddess of the Hearth, Hestia represents the relationship of women to the domestic sphere of life for whom household tasks are a central activity. She also has a social role as the hearthkeeper for the temple of the collective. Just as Hestia's flame is an image of the spirit that animates a home, it also represents the spirit that sustains the life of a culture. Her role, like that of the priestesses of Vesta in classical Rome, is to hold the soul of her culture, steadfastly to keep the flame alive whatever the turmoil of the outer world. Her inward search for meaning is not for

herself alone but to sustain the spirit that gives meaning to the culture. Sometimes this task requires her to sacrifice her tranquility and anonymity and step out of the background to remind her culture of who they are, what they value, and what they have forgotten.

As well as the flame in the domestic and communal hearths, the Homeric Hymns identify Hestia as the fire at the center of the world in Delphi. While Apollo made himself the presiding deity of the Delphic oracle, Hestia is the fire that ignites the prophecy. The flame is often used to symbolize psychic processes such as inspiration, intuition, and imagination, and Hestia represents these ways of knowing that were celebrated by Ovid in his hymn to Vesta. The story of Hestia's wooing is an image of a feminine way of balancing the tension between conscious and unconscious. She was desired by Poseidon, who as God of the Sea is often taken to represent the power of the unconscious, and by Apollo, who is an image of rational thought, art, science, and language. To keep peace in Olympus, Hestia vowed to remain a virgin. She is ever poised between the two gods and, between the rational and the irrational, yet ever complete in herself. In gratitude, Zeus declared that the first and last libations would always be hers, and, in Greek religious rituals, Hestia was always the first god to be honored.

However, Hestia lost this honor when a new god, Dionysios, was born. To make way for him among the 12 places on Mount Olympus, Hestia, weary of intrigue and arguments, gave away her position, knowing that she would be welcome wherever she chose to settle. In this ending of the myth, the Greek religion and Western culture suppressed an element of the feminine spirit and moved into the dualistic patriarchy defined by Nietzsche in terms of the polarity between Apollo and Dionysios.

Hierophany

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Hierophany is a term for manifestation of the divine. It is a broader term than the more familiar term, theophany, because it allows nonpersonal forms of the divine to become manifest. The term was popularized by the noted scholar of comparative religion, Mircea Eliade (1907–1986). His major thesis (1959) is the distinction in human experience between the sacred and the profane modes of life. Our ordinary lives are profane, but he does not use this in a pejorative sense but as simply the opposite of sacred, so a better term for contrast would be ‘mundane’. When we are in contact with the divine ground of being, we are in “sacred space and sacred time,” and when we are out of contact, we are in a profane or ordinary mode of existence. Whether it is in a formal worship service or a private experience of mystical communion with the divine, we have the capacity to enter into a new and more profound mode of being in the world. In this world of the spirit, we experience some type or degree of communion with the divine. Hierophany is the unfolding of that experience of contact, connection, or communion with a transcendent power or person.

For many people, it takes the form of a feeling of warmth, love, and connection to and receiving inspiration from a deity. For others, there is a “dark night of the soul,” a profound experience

of suffering, unworthiness, and alienation. Either the positive or negative inner and private experience we associate with mystics is what Rudolf Otto (1917/1958) referred to as the experience of the numinous. Even the relatively frequent experience the normal worshiper has of connection with the divine during the act of worship is an example of hierophany. Experience of and with the divine does not have to be dramatic and earth shattering; it can be quiet and secure. The experience of oneness with nature while in nature, likewise, can be the basis of a spiritual connection. This was articulated by such writers as the American Henry David Thoreau, whose spirituality centered on a sense of connection to the natural world.

In the Western religions, hierophany is experienced as theophany, since the divine takes on the form of a person. Buber (1958) characterizes this as an encounter of an “I” with a “Thou,” the highest quality of relationship that one can aspire to. There can be experiences which involve only part of senses, for example, ‘auditions’ or ‘locutions’ are the experiences of voices of the divine or their angelic representatives and “apparitions” are the visual manifestations of the divine or angelic beings. The many appearances of the Virgin Mary are examples of this type.

Another type of hierophany is revelation. This can be dramatic and life changing. The classic example is the experience of Saul, who on the road to Tarsus experienced an epiphany and turned from being a persecutor of Christians to become St. Paul, one of its most effective missionaries. Muhammed, likewise, experienced the dramatic visitation of an angel heralding the beginning of the revelations that became the Q’uran.

Hierosgamos

John Eric Killinger
The Intermundia Press, LLC, Warrenton, VA,
USA

Introduction

Hierosgamos is a composite of two Greek words ‘*ἱερός* (*hieros*) and *γάμος* (*gamos*), meaning “mystical marriage” or “sacred ceremony.” The word occasionally appears transliterated as two (*hieros gamos*) as it is presented in Greek. Often used interchangeably with *coniunctio*, the hierosgamos is recognized as the highest form of the union of opposites (e.g., King and Queen, Sol et Lunae) in the alchemical opus. Hierosgamos is found chiefly in the literature and theoretical work of analytical (Jungian) and archetypal psychology; nevertheless, it may possess implications for acting out of Oedipal vicissitudes observed in Freudian and psychodynamic psychology.

Hieros means “filled with or manifesting divine power, supernatural, holy.” Of this latter meaning, the word refers to the sense of being hallowed or consecrated, for example, holy scripture, even *hieroglyphics*.

Gamos, on the other hand, means “wedding,” “marriage,” and even “wedlock.” Pythagoras uses *gamos* as a name for the numeral *three*, which is masculine frequency. This would account for the motif of the divine child (produced by the union of the king and queen, Sol et Lunae, gold and silver) being usually male, e.g., Christ and Marduk. The usage of *gamos* for the number three allows for

the realization of the hierosgamos as the divine third. In this sense, it is connected with the Trinity in much of the writing of C. G. Jung.

Whereas Pythagoras designates *gamos* as three, Plutarch uses *gamos* for the number five. This immerses us into the symbolization of the marriage aspect of the 'Ihierosgamos as it is the combination of the feminine aspect (even frequency, i.e., two) and the masculine aspect (three or odd frequency). Rendering *gamos* as "five" could also refer to the alchemical *quinta essentia*, the quintessence that is the fifth element or red tincture that is indexed to the void or chaos encircled by the tail devouring serpent, or uroboros.

Further usage of *gamos* reveals it to denote the number six as used by Iamblichus (1998). In this sense, $1 + 2 + 3 = 6$, where six is viewed as a symbol of harmony or balance. It thus fits Islamic alchemist ibn Umail's projection of the *coniunctio* in his *Hallar-Rumuz*: one equals the observer of the hierosgamos, two equals the feminine aspect, and three equals the masculine aspect. For ibn Umail, six therefore symbolizes the union of polarity which thus creates balance and harmony.

The Prominence of Hierosgamos

As the highest form of the *coniunctio oppositorum*, or union of opposites, hierosgamos is the spiritual wedding of matter and psyche. We see this in the Babylonian *Enuma Elish*, wherein Âpsu and Tiâmat are not simply the ancestors of the pantheon of gods, but they are also matter and divine spirit united and coexistent.

Often used as a metaphor in reference to the union of two divinities, the hierosgamos can also refer to the union between a human being and a god or goddess, as in the Sumerian story of Tammuz (Dumuzi) and Inanna (Ishtar/Astarte), Zeus and Leda, and the Holy Spirit and Mary. Even Christian mystics such as St. Teresa of Avila and Hildegard of Bingen describe such experiences in their ecstatic visionary writings. The hierosgamos can also refer to a ritualized public sexual union

between a king and a *hierodule*, or sacred prostitute, as a reenactment of such stories as that of Tammuz and Inanna. While popularized in *The Da Vinci Code* (2003), such reenactments were believed to increase potency not only of the king but of the land's continued fertility. The alchemical text known as *Rosarium philosophorum* (Smith 2003) depicts the hierosgamos that occurs during the alchemical opus in the creation of the homunculus (little man). This homunculus is the divine child resulting from a more often than not incestual pairing within the hierosgamos. It is the potential for the hierosgamos to be incestual that leads an analytical relationship toward being inflationary (a wedding of the gods) or to sexual acting out – and that may have Oedipal ramifications.

Religious literatures are replete with the imagery of the hierosgamos. We have already noted its depiction in the Sumerian account of Tammuz and Inanna, which is wrought in erotically charged language. The hierosgamos occurs within reenactments of the Egyptian Osiris dramas of death and rebirth, which again has affinities with fertility cult rites. Union of the Kundalini (as Shakti) with Shiva is also equivalent to a hierosgamos. The Babylonian genesis account, *Enuma Elish*, presents the hierogamynous aspect in its depiction of Âpsu and Tiâmat. In Kabbalah, we find the hierosgamos in the union of Yahweh with the Shekinah, who is often portrayed as Sophia (wisdom). In *Sefer Zohar*, we find in the thought of Adam as an androgynous being that without a hierosgamos, without male and female being one, God does not place God's abode in their midst (Matt 2004, p. 314). Adam is the primordial image of the hierosgamos. Interestingly, though, Adam in the Old Testament represents the *imago Dei*, whereas the hierosgamos reflects the godhead. It is the genius of *Sefer Zohar* to point out that even the *imago Dei* is linked to the godhead, for male and female God created *them* – not *him* – and God called *them* Adam.

It is within the corpus of New Testament literature that we find more allusions to this sacred marriage. In Matthew 25:1–13 (Aland et al. 1998a, pp. 71–72), for example, we have a hint at a

hierosgamos in Jesus' parable of the wise and foolish virgins. The hierosgamos itself psychologically indicates a hostile, emotional outbreak of the divine element which destroys the world of consciousness – Jesus' coming to bring not peace but a sword is indicative of this; however, the deeper significance of the sacred marriage implicated within this parable is that the anima is made pregnant and initiates a new birth, that is, a further and more comprehensive incarnation with God. This is the psychological meaning of the need to be born from above in the exchange between Jesus and Nicodemus in John 3 (Aland et al. 1998b, pp. 252–254). It is an archetypal incest in which the god must join with the *imago Dei* in order to produce a new creation. Such an irruption of the hierosgamos and the devastation it causes is not unlike the irruption one encounters when Lacan's Real forcefully breaks into one's consciousness. Such devastating irruptions implicate the difficulty many Protestant Christians have with religious vocation, as the call to become (and be) a minister of God – let alone a religious – means at least metaphorically being wedded to the divine and not to the immediate environs or the world.

The potential unity of the cosmos is indicated in the seed motif (cf. the Christ's image of having as much faith as would fill a miniscule mustard seed in Matthew 17), but it also possesses an intrapsychic meaning as the germ of conscious realization of the self. Whereas this takes fertility rites such as those practiced in Osiris cults to deeper and higher levels – for as above, so below – such seed motifs were apparently abused. As reported by Iranaeus, the gnostic sect known as the Marcosians celebrated a hierosgamos as a sexual initiation of women into their fold, a sacred marriage both inflationary (of the gods) and incestuous in its acting out. The *Corpus Hermeticum* relates that God sows virtue, reason, and *gnosis* in the human mind, and the thirteenth treatise describes the inner rebirth of man from intelligible wisdom (Sophia) and the seed (*spermata*) of goodness that comes from God (Scott 1993).

It is in the apocalypse (Revelation) of John in which we witness more hierogamynous imagery. For example, the banquet of Christ alluded to in Revelation 3 (Aland et al. 1998c, p. 639) has been

interpreted as a hierosgamos with God. And in this sense, the celebration of the Eucharist (Lord's Supper) furthers the image of our union with God to bring about and perpetuate the vision of the new heaven, new earth, and new Jerusalem. A similar image of the banquet occurs in the pseudepigraphal *Odes of Solomon*, and its precursor is to be found in the Sumerian story of Inanna/Ishtar's descent to the underworld.

As the Sol et Lunae joining, the hierosgamos results in not just an inner reality. It is total reality according to the fifth parable of the alchemical text of the *Aurora consurgens* (von Franz 1966, attributed to St. Thomas Aquinas). The *Aurora's* vision of the union of Sol et Lunae is no doubt influenced by its appearance in Revelation 21:9 (Aland et al. 1998c, p. 676) in which the pair is joined in the image of the Sun-Moon Woman. She gives birth to the *complexio oppositorum* (complex of opposites), the uniting symbol which is a result of the union of the god and human sacred marriage. What is born is tantamount to a $\chi\rho\iota\varsigma\omicron\upsilon\chi\rho\iota\varsigma\omicron\varsigma$, a “not-Christ Christ” (not-Messiah Messiah), who not only separates/fragments, but also unites.

The phenomenal popularity of *The Da Vinci Code* (Brown 2003) has prompted much speculation and debate on the hierosgamos relationship between Jesus and Mary Magdalene, even including the grail mysteries' sexual reenactment of the hierosgamos to insure the Magdalene's rose, or blood, line. This subject has been previously broached in other texts such as Kazantzakis's *Last Temptation of Christ* (1960), not to mention the inferences contained in the gnostic texts of the Nag Hammadi, Berlin, and Tchakos codices. The question has been raised regarding the figure on Jesus' right in Leonardo's fresco of the Last Supper. Is it John who is the beloved disciple or the woman, Mary Magdalene, since she it is Jesus loves best? It is known that male youths were often painted with female attributes, perhaps as a nod to the inner feminine, and in early Christianity John was occasionally referred to as “maiden” (*parthenos*, i.e., “virgin” or “chaste man”). He is indeed Lacan's *jeune homme*, a *sinthome* – playing on the words *saint home* – possessive of rejuvenating qualities. In the gnostic Acts of Peter

and the Twelve Apostles, John is charged to be a doctor of souls, a healer of the heart (Meyer 2007, p. 365). Perhaps it is no mistake, then, that transliteration of the Greek *ἱερός γάμος* transitioned from two separate entities (*hieros* and *gamos*) to become one: *hierosgamos*.

Still, the transferential field posited by the *hierosgamos* within guided image therapy and active imagination, or even its context within the relationship between analyst and analysand or therapist and client brings to bear all the rich symbolism of this *coniunctio* or sacred marriage, awakens our awareness of the unconscious connection, and allows us to witness firsthand the numinosity of *coniunctio*. Balance and harmony must be stressed, for on the one hand, conscious evolution of the symbolism of the *hierosgamos*' numinosity can have very creative and releasing consequences; on the other hand, the shadow side of the unconscious development of this same symbolism can have deleterious and destructive consequences. The *hierosgamos* is thus linked to the uroboros as life-giving/renewing qualities as well as for its ability to take and/or destroy life.

Hijrat: The Islamic Psychology of Migration

Sajaudeen Chapparban

Centre for Diaspora Studies, Central University of Gujarat, Gandhinagar, Gujarat, India

Was not the earth of Allah wide spacious enough for you to emigrate therein? – Quran (4:97).

“Hijrat” is an Arabic word, derived from “*hijr*,” means “to depart.” It is also used for “to shift” or “abandonment.” In Islam, it generally means “to give up one’s own land” or “to migrate from one place to another place” mostly for the sake of

Deen/faith and Allah. Hijrat as a term came into prominence from the *Hijrat* (migration) of the Prophet Muhammad^{PBUH} and his followers from Mecca to the city of Medina in 622 A.D. The Islamic almanac starts from this remarkable event in the history. It counts years in “Hijri” as in Alexandrian CE/AD. Various interpretations of this term by different Islamic scholars has given multiplicity to its meanings. Enaytulla Subhani in his biography of Prophet, *Mohammad-e-Arabi* writes, “Leaving home and place for the sake of God is and settling in other place is called *Hijrat*” (translation is mine 175). Thomas Patric-Huges in his *Dictionary of Islam* writes, Hijrat means, literally, migration. He gave four other definitions of Hijrat. First one is “the departure of Muhammad from Makkah.” Second one is “the Muslim Era.” Third one is the “act of Muslim leaving a country under infidel rule” and fourth is “fleeing from sin” (174). Other scholars think that *Hijrat* must be used only for the migration which took place for the sake of God and to protect the *Din/Believe*. Jami’-at-Tirmidi writes,

Now there was no need for emigration, (from Makkah to Al-Madinah) but people moved from one place to another place for *ijajj*, *‘Umrah*, *Jihad* and the acquisition of knowledge, etc., this type of movement and *travel* is not migration. The place or country where it is not possible to protect one’s faith, and there is no other choice except emigration, then it is necessary to emigrate to a safe place. (pp. 357–358, Vol. III)

Ibn Kaseer, Allama Zamakshhiri, Allama Rashid Raza Misri, Syed Qutb, Maulan Abu Aala Maududi, Abdullah Yusuf Ali, and Maulana Amin Islahi et al. believe that the migration should take place from *Dar-al-harb* to the *Dar-al-Islam*. *Dar-al-Harb* means abode of nonbelievers and *Dar-al-Islam* means abode of believers (Muslim). But nowadays Hijrat as a term is applied to various other forms of migrations such as migration for education, job/career, exile, refugee, or the sake of God or *deen*, *tabligh*/propagation of *deen*, etc from *Dar-al-Islam* to *Dar-al-harb* too.

In Islam, interestingly, believers are asked to migrate from one place to another as a part of *Iman*/belief from uncomfortable place to the comfortable one, where one can practice and

propagate his or her *deen*/faith without any difficulty or persecution. Allah says in Quran,

And whosoever migrates in the path of Allah will find limitless refuge in the wide expanse of the earth. And whosoever flees his home, migrating for the sake of Allah and the Messenger and is overtaken by death, then, verily his reward is established before Allah. Indeed, Allah is the For-giver and Merciful. (Quran 4:100)

Earlier Prophets starting from Adam, Abraham, Loot, Jonah, Jacob, and Moses to till the Last Prophet Muhammed (Peace Be upon Them) were told to migrate from their birth places for various reasons like natural calamity, persecution, protecting faith, etc. and their migration also considered as act of Hijrat. Muslims do believe that the arrival of Adam from *Jannat*/Heaven to Earth is also a kind of Hijrat, act of migration. Therefore its understood that all human beings real home/motherland is Heaven unto which they all should return. This Islamic belief is derived from one of the sayings of the Prophet Muhammed:

The story of this saying of Prophet is narrated by one of his companions, Ibn Abbas. According to the story, Umar visited the Prophet while he was sitting on a mat, and he said to Prophet that the Prophet should have a wonderful bed instead of sleeping in a mat. The prophet responded in a following way, ‘I don’t have anything to do with this world. My story is like a rider in a desert who takes shade under a tree for a certain moment and then departs from here’. (Quoted in Sarotopark n.p.)

It means human life in this world, since birth, is also a kind of “temporary migration” from Heaven to the Earth and one-day she/he must return. Therefore, we find the Muslims believe in the life hereafter. They also long for Heaven, their real “homeland” as it is one of the characteristics of all diaspora people. This Islamic understanding can be read through David Cohen’s definition of diaspora, as he said that the “Diaspora signified a collective trauma, a banishment, where one dreamed of home but lived in exile” (Introduction ix. 1997). For all Abrahamic faiths for that matter, the banishment of Adam from Heaven is like “collective trauma”/punishment for human generation, where Muslims dream of heaven and for them living on earth is like living in exile. As William Safran says about the general

Diasporas that they “regard their ancestral homeland” as their true, ideal home and as the place to which they or their descendants would eventually return” (1991, p. 83). Likewise, in Quran we find many references about all human being’s “return.” The word ‘return’ appear nearly about 50 times in Quran, as “ancestral homeland”/“true, ideal home” for human being is *Jannah*/Paradise, on to which we all should return at the end. Here are some referential verses: “And towards Him is their *return*” (2:46) and “Then to Me you shall *return*” (Quran 3:55) [Emphasis added]. One of the *Hadiths* of Abdulla Ibn Umar^{Rz} indicates this idea of how worldly life is a temporal affair. Abdullah said,

Allah’s Messenger (ﷺ) took hold of my shoulder and said, ‘Be in this world as if you were a stranger or a traveler.’ The sub-narrator added: Ibn ‘Umar used to say, “If you survive till the evening, do not expect to be alive in the morning, and if you survive till the morning, do not expect to be alive in the evening”. (quoted in al Bukhari n.p.)

Hijrat of Muhammed and his followers from Mecca to Medina plays an important role in shaping of Muslim psychology and since then, Muslims consider migration as an attempt to liberate and empower oneself from the bad circumstances. This Hijrat helped the Prophet and his followers to strengthen themselves in every respect. In Mecca, increasing humiliation, boycott of Prophet by Quraysh, Death of Hazrat Khadija (wife of Prophet) and Abu Talib (His Uncle who used to support him), and rejection of Prophet at Taif let Prophet to think about migrating to Medina. He told his companions to migrate and he waited till the *wahi*/message came from the God. Once he received *wahi*, he also left for Medina leaving his relatives and his birth place Mecca, the city that he loved the most. *Muhajjeers*/immigrants were welcomed by the *ansars* (those who helped the *muhajjeers* in Medina). Here in Medina, people were aware of the intellectuality and leadership qualities of Muhammad^{PBUH} in Mecca. *Muhajirins* are “assimilated” in the society of Medina. They build their prayer houses as other classical Diasporas did. But this was not the case with *muhajjeers* of Mecca in Median as what

William Safran foresees in the case of other diasporas, who, “believe that they are not – and perhaps cannot be – fully accepted by their host society and, therefore, feel partly alienated and insulated from it” (Safran 83. 1991).

This *hijrat* has given a space for Muslims to empower. When Ansars declared Mohammad as not only their religious leader/preacher but also the Statesman, this boosted the development and expansion of Islam geographically, politically, and economically. Prophet’s longing for going back to the mother land/ “home land” can be seen when he found the “conditions are appropriate” (Safran 84) to return and marched to Mecca. “The Prophet entered into the city of his birth without any oppression and planted the great banner of Islam at the door of his tent. The rebellion city now lay at the feet of the abused, rejected and exiled Prophet” (Ali 64).

Hijrat is also considered as the *barakat*/auspiciousness. It is a “prelude for honor, liberty, peace, and prosperity. It means multiplicity of resources and mean of subsistence; leads from slavery to the highest altitudes of independence and self-reliance” (Rafiabadi 2). Mohammad Abdullah al-Thaman opines that, “Hijrat is the light of the path from destitute to wealth; moving forces from feebleness to strength, and a voyage from fear to peace” (qtd. in Rafiabadi 2). Hijrat is also about the great sacrifice. Those who do sacrifice for their *Deen* by leaving everything behind Allah promise them in Quran:

Behold! I do not overlook the deeds of anyone whether it is a man or a woman; (you are) one of the other. So, for those who migrated and were expelled from their homes and who were tortured in My way and fought and were killed, I will certainly remove from them (the blight of) their errors and admit them to the Gardens beneath which flow streams (of Devine grace). This is the reward from Allah. Lo! With Him are the beautiful rewards! (3:195)

Quran also questions to those who did not migrate during the time of Prophet when Prophet told the believers to migrate and lived the life under the oppression and fear. *Qurans* asks, “Was not the earth of Allah wide spacious enough for you to emigrate therein?” (4:97). And warns to those who did not migrate, “for such as these, their

destination is Hell, and a woeful destination it is.” (4:97).

The idea behind the formation of Pakistan, apart from political reasons, was also an inspiration of this Islamic psychology to be free from the Hindu majoritarianism. Muslims thought that they and their faith would be under threat and fear under the growing Hindu dominance/extremism – hence, the demand for separate nation fanned from both the sides. Their dream of creation of *dar-al-Islam* led to the millions of Muslims to leave India.

In nutshell, the idea of Hijrat/migration is perceived among the Muslims as one of the important *sunnahs* of (deeds/way of life of Prophet) Muhammed^{PBHU}, as a duty of believers to migrate from *Dar – al – Harb* to *Dar – al – Islam*, and the *barkat*/auspicious act. These notions have contributed to the shaping of the psychology of Muslims to take migration not merely as an act of moving from one place to another place but also a part of *Imaan*/belief.

Hillel

Lynn Somerstein

Institute for Expressive Analysis, New York, NY, USA

Rabbi Hillel (born in Jerusalem, traditionally c.110 BCE–10 CE) was a famous Jewish religious leader and scholar associated with the development of the Mishnah and the Talmud. He was renowned for his love of learning and his compassion.

He asked: “If I am not for myself, then who will be for me? And if I am only for myself, what am I? And if not now, when?”

Hillel’s question “If I am only for myself, what am I?” underlies individual human development – the search for the self and understanding who the self is in relation to others. Psychotherapeutic interaction concerns itself with searching deep within to find what is true for the individual and then finding ways for the individual to make contact with others, a process leading from a narcissistic engagement with the world to a fuller, open, mature being, whose everyday life embodies a full engagement with God and the world.

Hillel also said: “What is hateful to you, do not do to your fellow: this is the whole Law; the rest is the explanation; go and learn” (Shab. 31a). With these words Hillel recognized as the fundamental principle of the Jewish moral law the Biblical precept of brotherly love (Lev. xix. 18).

He is also reputed to have invented the “Hillel sandwich,” many centuries before the Earl of Sandwich, who is more commonly held responsible for that culinary morsel. The Hillel sandwich is eaten at the Passover Seder. Ashkenazi Jews eat

horseradish on matzoh as part of the Seder meal and call that the Hillel Sandwich.

Hillman, James

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

James Hillman (1926–2011) was a trickster *extraordinaire*, the radical rethinker of post-Jungian psychology who challenged many cherished assumptions of psychology and religion and pointed the way to a bold new way of seeing psychology as a variety of religious experience. Hillman studied in Paris, Dublin, and the University of Zurich, where he earned his Ph.D. in 1959. That year he became Director of Studies at the Jung Institute until 1969. In 1970 he became editor of *Spring Publications* and made it a stimulating forum for new ideas in archetypal psychology for many years. He taught at the Pacifica Graduate Institute near Santa Barbara for several years, where most of his library is archived. While he agreed with Jung on many themes, such as the centrality of archetypal images, and expanded Jung's view of the shadow, Hillman disagreed with the centrality of Jung's monotheistic central Self as the divine within, symbolized by the circle mandala, and instead stressed a polytheistic view of divinity and soul in the world. In his 1964

Suicide and the Soul, he urged therapists to stop seeing thoughts of suicide as symptoms to be cured but as symbols of philosophical life issues.

Hillman challenges psychology to expand out of its medical roots and to see its *poetic and religious depths*. He makes especial use of Greek gods and goddesses to make his point that all soul events, like therapy, are rituals of gods. For the many gods are living personifications of the depths of soul and world. They are not “in” our theoretically subjective psyche, but we are in them, like being in love is being in Aphrodite. While the theoretical ego of modernism enjoys its illusion of being in control, the gods are images of more powerful forces in us and in the world. He decenters religion into a polytheistic company, each with a shadow that cannot be ignored. Jung pushed open the door to seeing many images of divinity – stones, trees, animals, and goddesses – but still focused on one God. Hillman flung this door further open, exploring the power of many divinities.

Hillman slips out from under the moral assumptions of much psychology and shakes the reader into facing the unthought surprising turn-arounds of many concepts. Mars is active flexing his muscles in war. Dionysus dissolves our egos with ecstatic passion in the flashing lights, thundering music, and seductive dancing of night-clubs. Hillman is not interested in reviving old faiths, but in portraying gods as ever-present numinous images (Hillman 1975, pp. 35–36).

Hillman renames his jumping off from Jung as *Archetypal Psychology*, rather than Analytical Psychology or Jungian Psychology, taking the postmodern path of stressing that “archetypes” are never perceived, but are theoretical constructs behind experience. So we should never speak of substantive “archetypes” as basic forms governing the psyche, as if we could see or know them, any more than humans could perceive Platonic forms. What we can experience are archetypal images that are not contained in the mind, thus limiting psychology to individual psychoanalysis. They pervade the world, not just in the collective unconscious, but in all experience. So all soul's experience has an imaginative, fantasy element, pervading culture and cosmos:

Thus, archetypal psychology's first links are with culture and imagination rather than with medical and empirical psychology, which tend to confine psychology to the positivistic manifestations of the nineteenth-century condition of the soul (Hillman 1975, p. 48).

Hillman focuses on keeping the images in dreams central, not boxing them into a conscious theory, like an Oedipus complex or a Shadow archetype. Symbols don't stand for anything else, Hillman says they are the soul itself in its visible imagination. He developed this theme in his major *Re-Envisioning Psychology* (Hillman 1975) that was nominated for the Pulitzer Prize, encouraging "staying with the images" or "personifying." He also sees therapy not as always healing but perhaps pathologizing – staying with a pathology's falling apart long enough to see through its literalism to what the soul's images and stories cry for. Similarly, archetypal psychology is not humanistic, not staying at the human level, but seeing the gods as metaphors for "cosmic perspectives in which the soul participates" (Hillman 1975, p. 169) – personified images of lovers, warriors, tricksters, death, and life itself. Therapy is not science but hermeneutics – interpreting soul's images, not proving anything for ego's sake.

In *The Dream and the Underworld* (Hillman 1979a), Hillman says let the ego go deep into the underworld of the soul, where it is no longer in control, and listen to the mythic pattern of a dream's images, such as a serpent. In the underworld, let the images speak and bring their surprising, even shadowy revelations. A symbolic serpent's bite is poisonous not only to the ego but to the soul, it may bring transforming wisdom and intuitive insight. Listen for the opposites of what ego expects. Death may be the death of an archetypal part of the soul, outworn, painful assumptions that need to die to allow new life and soul to be born. Get out of ego's materialistic literalism and subjective humanism. Dive into the mysteries of soul and swim in its vast ocean of archetypal dramas. Ride a whale, kiss a mermaid, and dissolve yourself into the greater mysteries. It's only imagination but full of meanings.

In *Puer Papers* (Hillman 1979b) Hillman develops the themes of the archetypal, mythic Senex or Chronos, a wise old man who favors conservative, static, family history, and approaching death, like Captain Hook. Puer, like Peter Pan or Icarus, is the eternal youth, playful, creative, innocent, revolutionary, and irresponsible. These extremes pervade and overlap in every life and can capture one's ego-consciousness or be welcomed to help negotiate life's journeys, each in turn as needed.

In the challenging book *We've Had a Hundred Years of Psychotherapy and the World's Getting Worse* (Hillman and Ventura 1992), Hillman, in conversation with Michael Ventura, charges that psychotherapy has been so individual, inward, and subjective that it has stifled its ability to see soul in the world and analyze the world's cultural pathologies. Therapy has helped us work on our relationships and feelings but meanwhile has a blind spot: ignoring the world's need for psychotherapy, disintegrating in poverty, pollution, and the decline of industrial society. The sicknesses are out there – the financial institutions, the buildings, the cities, and the schools – decaying in the Cartesian dualism that sees the world out there as a dead resource bank for human power and pleasure. Archetypal psychology can restore our way of seeing soul in the world – *anima mundi*. "We are abused and victimized less by our personal lives of the past than by a present system" (Hillman and Ventura 1992, pp. 38–39). What's sick is the rigid mental dualism between inner fantasy and outer reality. "Reality is always coming to, a point of view, a language – a fantasy" (Hillman and Ventura 1992, p. 39). The self is an "interiorization of community. . . . If I am not in a psychic field with others – with people, building, animals, trees – I *am* not" (Hillman and Ventura 1992, p. 40).

This can and should open soul to ecology and social conscience, but, like all psyche, it also has a shadow. For example, feverish adolescents may be addicted to their electronic "friends" but unaware of the inner and outer soul. Still innocent and seeking acceptance by peers rather than being helped to listen to their souls, they drive recklessly while texting or sexting. New research indicates

that “stress arises largely from “the irritations of daily life,” which I take to mean again the aesthetic disorders of the environment, such as racism, noise, crowding, traffic, air quality, crime fears, . . . violence fears . . . school systems...” (Hillman and Ventura 1992, p. 81). Jung said that the collective unconscious is the world, and the psyche is not in you, but you are in the psyche (Hillman and Ventura 1992, p. 83). A city is a soul – Brooklyn’s ethnic variety or Houston’s cowboy swagger.

Materialism and its literalism, blind to its soul, is the disease of our time, so “Trying to break through to non-material experience is the real number-one crime in America today.” Despite the dangers of drugs, “the so-called drug war is a war against seeing reality in any but a strictly materialist, Puritan way” (Hillman and Ventura 1992, p. 149). Hillman agrees with others that the conventional psychology profession is so competitive, repressive, moralistic, and concerned with credentials, income, and status that it has become mediocre and oppressive, blind to fresh insights such as seeing the imaginative basis of thinking and soul in the world (Hillman and Ventura 1992, p. 155).

In his 1996 *The Soul’s Code* that became a *New York Times* best seller, Hillman challenges the psychoanalytic focus on the family drama as major shaper of character. Instead, he argues, each soul is born with a seed, like an acorn, that wants to grow in a certain direction. It may be bent by the environment, but many children have shown early tendencies that blossomed into great talents, despite parental or school disapproval. Picasso cared little for school except drawing. Such children should not be forced to stifle their inborn talents.

Hillman’s irony takes off with his 2004 *A Horrible Love of War*. He argues that war is normal, inhuman, sublime, and religious – and of course, we love it.

- *War is normal*. Hillman opens with Patton’s WWII quote, as he strode around the bloody aftermath of a battle and exclaimed: “I love it, God help me I do love it so; I love it more than my life” (Hillman 2004, p. 1). We can never

prevent war unless we explore how the soul’s mad love for war makes it interminable. Tolstoy believed that war is determined by some force beyond human will (Hillman 2004, pp. 6–7).

Americans invented the nuclear weapons that have been imitated as a sign of national pride worldwide and have raised the level of everyday anxiety. Now we just suffer the unending parade of smaller terrible wars around the world that inflict enough tragedy and risk the financial solvency of any nation like the USA that tries to put out the fires of the ones that seem to threaten its own imagined security. But during the 5600 years of recorded history, 14,600 wars have been recorded (Hillman 2004, p. 17). Hillman says: “Though saying ‘war is normal’ shocks our morality and wounds our idealism, it stands solidly as a statement of fact” (Hillman 2004, p. 21). No matter how many bodies return mangled or dead, no matter how much posttraumatic stress disorder maims the survivors, no matter how much the military budgets threaten to undermine governments, as it did in the Soviet Union, all these are outdone by the barking dogs of the next round of manic aggressiveness. Hillman admits the unvarnished dark truth that “the necessity of war is laid down in the cosmos and affects life with the unbearable, the terrible, and the uncontrollable.” So “Normalcy” must adjust (Hillman 2004, p. 41). Americans must ask, who invented the repeating gun, nuclear weapons, and all the Pentagon’s massively expensive machines of war?

- *War is inhuman*. When millions are killed annually and when normal social norms are wiped away by sanctioned rape, robbery, torture, and child abuse, these are age-old horrors of war that just won’t stop. The war god of Rome, Mars, lives on triumphant, a mythic enactment of national glory and territory, paranoid fear, and ruthless phallic domination. Like a spooked horse, wars thrive on some invisible, frenzied autonomous transcendent divine power beyond normal control (Hillman 2004, p. 77). Or is that from our ancient animal instinct? The seizure of a soldier by an animal

instinct is like the Norse “going berserk” which meant “to wear the bear coat” (Hillman 2004, p. 78). Soldiers tell of feeling immortal, untouchable by death, fearless, and wild (Hillman 2004, p. 80). Is war so untouchable that it must become a sacrament, a holy power of destruction? Do goddesses of death/life like Kali picture today’s war lust? How is the inhumanity of war sustained?

- *War is sublime.* Mars and Venus made sublime love in Roman myth, as did Ares and Aphrodite in Greek myth. The mythic Trojan war was fought over the love of Helen. A member of Gen. Patton’s staff wrote his wife that the most gorgeous sight he ever beheld was an enemy bomber smashing into flames on a mountainside (Hillman 2004, p. 116). This kind of spectacular, horrid but sublime beauty fills the souls of fighters, alongside their fear, feelings of immortality, and heroic bravado. War is a defining moment in warrior’s lives, when they face death and thus elevate bravery to a sublime moment. Glorious gods are experienced in facing death, the guns, the loyalty to comrades, and the ecstasy of combat.
- *Religion is war.* “War is a force that gives us meaning,” Hillman says, “because war raises life into *Importance*... the infinitude in the finite” (Hillman 2004, p. 178). Belief is the short fuse that sets off the explosions of war. The monotheistic religions are especially bellicose, dogmatically claiming their god is the only god, and all others are heathens and infidels (Hillman 2004, p. 185). Americans sing “God Bless America,” Enemy WWI Germans wore belt buckles inscribed “Gott Mit Uns” (God is with us). Both claimed the same God. The Jewish God is a god of war. Islam breeds a warrior spirit. Soldiers of Christ are at war with the world, the flesh and the Devil, easily projected upon other nations (Hillman 2004, p. 188). How many nations’ proclaimed religious innocence conceals such passive-aggressive hypocrisy? (Hillman 2004, p. 189). The fog of war throws together lies about enemy threats and hymns to blind patriotism. Mob hysteria takes over. Rash promises

of quick victory are believed. War is bred by pious, self-righteous religious faith.

Hillman strips off the surface reasoning of psychological and religious constructions and drags us down into the dank underworld of soul and culture, to see anew what ego has missed.

Hillman, James, and Alchemy

Stanton Marlan
Psychology, Duquesne University, Pittsburgh,
PA, USA

It has been said often that James Hillman (1926–2011) was one of the most original American psychologists of the twentieth century. He is the founder of archetypal psychology, considered by some to be an orientation or school within the

larger context of Jungian analysis and by others as a radical departure from it. In its own regard, archetypal psychology has had wide influence both in the USA and internationally and has impacted not only psychology, analysis, and religion but also the wider range of the cultural imagination as well. Hillman's work on alchemy is an important part of his overall vision and has its origins in the work of Carl Jung.

Jung's Psychology of Alchemy

Jung, too, had thought about alchemy in a way that few others before him had imagined. Rather than understanding alchemy as a protoscience of chemistry, he concluded that the alchemists were speaking in symbols about the human soul and were working as much with the imagination as with chemical materials. In short, the gold that they were trying to create was not a common gold, but an *aurum non vulgi* or *aurum philosophorum*, a philosophical gold (Jung 1963). For Jung, "alchemy represented the projection of a drama both cosmic and spiritual in laboratory terms. The opus magnum had two aims: the rescue of the human soul and the salvation of the cosmos" (Jung 1977, p. 220). This move brought our understanding of alchemy into the realm of both psychology and religion. A vital part of Jung's work soon began to address these disciplines. In and through his work on *Psychology and Alchemy* (1953/1968), his essay "Paracelsus as a Spiritual Phenomenon," and other works, Jung was led to discuss alchemy as a form of religious philosophy (Jung 1963, p. 209).

As Jung continued to grapple with his personal experience of alchemical transformation, questions continued to surface and shed light on his ongoing relation to Christianity. For Jung, Christianity was of central importance for the Western psyche, but he also felt it cast a collective shadow that needed to be addressed if it was to remain vital to the spirit of the times and relevant to modern men and women. Jung's attempt to bring analytical psychology into relation with Christianity ultimately led to the question of Christ as a psychological figure. From Jung's alchemical

view, Christianity had depreciated the body and "the feminine" and, in so doing, ultimately had devalued "nature." Alchemy, with its emphasis on matter, compensated for this lack in Christianity and thus offered the possibility of the further development of the religious psyche.

Hillman's Alchemical Psychology

While Jung critiqued Christianity via his alchemical vision, for James Hillman, Jung's psychology was still overly influenced by Christian psychology, its images, and its metaphysics. This led Hillman to make a distinction between a psychology of alchemy and an alchemical psychology, the former representing Jung's views and the latter Hillman's. For Hillman, the transformation of the psyche must be differentiated from the Christian idea of redemption. For Hillman, images speak more directly when their Christian and metaphysical coverings are set aside; then the "level of the collective consciousness can be peeled away, so that the material may speak more phenomenally. Then pagan images stand out: metals, planets, numerals, stars, plants, charms, animals, vessels, fires and specific locales" (Hillman 2003, p. 101).

In short, alchemy's curious images are valuable not so much because alchemy is a grand narrative of the stages of individuation and its conjunction of opposites, nor because of its reflection on the Christian process of redemption, but "rather because of its myriad, cryptic, arcane, paradoxical, and mainly conflicting texts [which] reveal the psyche phenomenally" (Hillman 2003, p. 103).

For Hillman, imagining alchemy within the narrations of metaphysics, Christianity, and Jung's psychology led to a "psychology of alchemy," a psychology in which the powerful images of alchemy were reduced to generalized abstractions. He, on the other hand, proposed an innovative move away from a "psychology of alchemy" to an "alchemical way of psychologizing." In so doing he hoped to restore an alchemical way of imagining (by seeing through concepts, both deliteralizing and rematerializing them, "giving them body, sense and weight") (Hillman 1980b, 1981a, pp. 37–39).

The work of soul-making requires corrosive acids, heavy earth, ascending birds; there are sweating kings, dogs, bitches, stench, urine, and blood.... I know that I am not composed of sulfur and salt, buried in horse dung, putrefying or congealing, turning white or green or yellow, encircled by a tail-biting serpent rising on wings. And yet I am! I cannot take any of this literally, even if it is all accurate descriptively true. (Hillman 1980a, p. 37, 39)

Through the use of the alchemical imagery and concrete metaphor, and by seeing through them, Hillman sought to find those qualities of human life which act on the very substance of personality.

Development of Hillman's Perspective

This move toward concreteness was present in Hillman's earliest lectures in Zurich in 1966 and continued to run through his papers beginning in 1970 with "On Senex Consciousness." In 1978, Hillman published "The Therapeutic Value of Alchemical Language," which set the stage for his continuing reflections.

What followed were a series of papers: "Silver and the White Earth, Parts I and II" (1980b, 1981a), "Alchemical Blue and the Unio Mentalis" (1981b), "The Imagination of Air and the Collapse of Alchemy" (1981c), "Salt: A Chapter on Alchemical Psychology" (1981d), "Notes on White Supremacy: The Alchemy of Racism" (1986), "The Yellowing of the Work" (1991), "Concerning the Stone: Alchemical Images of the Goal" (1990), "The Seduction of Black" (1997), and "The Azure Vault: The Caelum as Experience" (2006), which is a revision and elaboration of his paper "Alchemical Blue." Hillman's alchemical papers have been published in the Uniform Edition of the Writings of James Hillman, volume 5, entitled *Alchemical Psychology*. To his published papers to date, he added "Rudiments: Fire, Ovens, Vessels, Fuel, Glass," which completes his texts on alchemical psychology. Like alchemical texts themselves, the content of these papers is complex and difficult to summarize in any unified narrative, but if there are any themes that run through them, it is in his turn to the nuances of language and image, the importance of the imagination and attention to

alchemical aesthetics, and to color as an organizing focus for reflection.

Every year, the Dallas Institute of Humanities and Culture sponsors a Hillman Symposium at which it invites scholars from different disciplines to present a paper in which they engage with an aspect of Hillman's work. These papers are then published together in book form. Volume 3 of this series (2016) was entitled *Conversing with James Hillman: Alchemical Psychology*.

Hiltner, Seward

James G. Emerson
San Francisco, CA, USA

If one line would describe the contribution of Seward Hiltner (1910 to November 19, 1984), it would be this: he put the “theology” into practical theology. In Dr. Hiltner’s work, developed at the University of Chicago in the 1950s, the personality sciences and the theological or religious field came into dialog.

Pastoral Theology Defined

For many the phrase “practical theology” meant simply techniques of doing ministry. For some the techniques had to do more with manners than with the practice of care – proper dress and appropriate behavior rather than the “care” or “cure” for the parishioner. Seward Hiltner saw pastoral theology as the theology of the practice of ministry.

Every science has a method and the method for the personality sciences, especially when related to religion, was the “perspectival method.”

The Perspectival Method

Therefore, to understand Dr. Hiltner’s approach, one must first understand his concept of perspectives and the perspectival method. As early as the 1950s, he developed “the perspectival method” of research and evaluation. Today the perspectival method has been picked up by people such as Jerome A. Feldman (2006) in the field of cognitive theory.

For Dr. Hiltner, there were three perspectives from which to look at the total work of the pastor – the communication perspective, the organizing perspective, and the shepherding perspective. The “shepherding perspective” he identified with pastoral theology.

In his basic book, *Preface to Pastoral Theology*, Dr. Hiltner gave a review of the development of the “cure of souls” – care of souls – that preceded what became pastoral care and counseling. To develop his approach he dipped into history and the work of an Ichabod Spencer – a nineteenth-century pastor in Brooklyn who, according to Dr. Hiltner, was among the first to develop case studies of his pastoral work. It was in Spencer that Dr. Hiltner came to focus on pastoral care as the province of the shepherding perspective.

The Shepherding Perspective

The significance of this perspective lay in not identifying pastoral care just with counseling or times of calling on the sick. The perspectival approach meant that one could look at preaching, church administration, and Christian education as much from the shepherding perspective as much as the moment when someone said, “Pastor, I have a problem.”

Dr. Hiltner, therefore, identified pastoral care as related to the shepherding perspective. He saw this perspective as particularly a function of the parish minister in practice. Although his work resulted in a profession of pastoral counselors and of pastoral counseling centers, that development was never his intent. Dr. Hiltner understood this shepherding perspective as strictly part of a

pastor's pastoral ministry in the context of the parish congregation itself. The ministry was not something done outside of the parish in a context unrelated to a particular parish.

Pastoral Counseling Centers

Dr. Hiltner's approach laid a foundation for bringing science and faith together as the cornerstone of the work of the pastor. Contrary to his expectations, the clarity with which this foundation developed in Hiltner's books resulted in people who developed a specialty in such a ministry just as others developed a specialty in Christian education. As a result, this specialty soon broke out of the congregational realm and became a freestanding profession in itself. Ministers with a specialty in pastoral care and counseling soon became members of church staffs. More than that, centers of pastoral care and a profession of pastoral counselors emerged.

In some instances, these centers were adjuncts of congregations. More and more, however, the profession of pastoral counseling broke off into its own discipline with standards of practice and criteria for both certification and evaluation of pastoral counselors. In several instances around the United States, counseling centers emerged. One such example is the Lloyd Pastoral Counseling Center connected with San Francisco Theological Seminary in San Anselmo, California.

This major diversion some see as a contribution of Seward Hiltner. Yet Dr. Hiltner himself always saw pastoral care and counseling as in the context of the pastorate, not the context of a center unrelated to a congregation.

This matter of context was not just a passing interest of Seward Hiltner. In a book authored with the late Rev. Dr. Lowell Colston entitled *The Context of Pastoral Care* (Abingdon Press, Nashville, Tennessee), the picture was given of the contrast between counseling done at a Center and counseling and care in the context of a parish community. The argument was made that there is a basis for seeing the counseling done in the context of a congregation as having, for many, a

greater rate of success in healing than in a setting where there is no relation to a community of people.

The other two perspectives that Dr. Hiltner identified with the work of ministry are "organization" and "communication." Note that he did not speak of preaching, counseling, educating, or administration as perspectives. Each of those he saw as a *function* that could be viewed from the three perspectives. One could ask, "what is the shepherding dimension of preaching?" just as one could ask, "what is the communicating dimension of pastoral care?"

Seward Hiltner represented the second generation of leaders in the movement of pastoral education who related the insights of the personality sciences – especially individuals such as Freud, Jung, and Adler – to the professional practice of ministry. The fountainhead or "father" of this direction was Anton Boisen of Boston.

In the course of time, Seward Hiltner was ordained a Presbyterian Minister. He became the secretary for the department of Religion and Health of what became the National Council of Churches. His first book related to the interplay between the personality sciences and religion. He then wrote on Pastoral Counseling and *The Counselor in Counseling*. The very title of the encyclopedia in which this article appears would not exist without the pioneering work of Boisen and the key "disciples" that moved out across the United States and developed what they had learned.

In 1950, Seward Hiltner was tapped by the Divinity School of the University of Chicago to join with Dr. Ross Snyder in developing a doctoral program. No longer was pastoral care seen as a technique. The University of Chicago called the field "Religion and Personality." Because "personality" referred to personality studies such as psychology, psychiatry, sociology, and anthropology, subsequent years saw changes in the title. The breakthrough came, however, in that first program that pioneered the field of pastoral care as an academic discipline and as seen at the doctoral level.

Under Dr. Hiltner's leadership, the program involved not only the Divinity School but the Medical School of the University of Chicago

and the Counseling Center of the university established by Dr. Carl Rogers.

The impact of the program was tremendous. Of the first graduates who earned the PhD, most went to establish similar departments in divinity schools and seminaries across the United States, in Australia and New Zealand, and in the United Kingdom.

Dr. Hiltner himself wrote ten books and over 500 articles. Those who graduated from his and similar programs around the world have added much. Whole sections of libraries in both secular and theological schools now have space to hold the work of this relatively young theological discipline that relates science and theology in the academic world.

Hindu Women Gurus

Karen Pechilis

Drew University, Madison, NJ, USA

Hindu female gurus are a highly visible phenomenon in the contemporary world. Several Hindu female gurus have a high-profile existence as spiritual leaders who frequently travel across the globe for sessions with their numerous devotees; examples include Anandmurti Gurumaa, Gurumayi Chidvilasananda of Siddha Yoga, Karunamayi Ma, and Mata Amritanandamayi

(Ammachi). Distinctively, Mother Meera, who garnered initial fame by her association with the famous gurus Sri Aurobindo and the Mother, tends to remain at her ashram in a small town in Germany, where she provides her devotees with viewings (*darshan*). In a different register, Ma Jaya Sati Bhagavati, who experienced *mahasamadhi* on April 13, 2012 (in Hinduism, when a great spiritual leader passes away, this is called *mahasamadhi* or “consciously leaving the body”), received numerous awards, including the Gandhi Foundation Award in 2007, in recognition of her service in advocating for people living with HIV/AIDS including caring for infected persons at her Kashi Ashram in Sebastian, Florida. All of these gurus have official websites on the Internet. The international fame and authority of these female gurus stands in marked contrast to the long historical pattern in Hindu tradition that the role of authoritative guru who has a public presence is limited to men. The study of Hindu female gurus contributes to our understanding of the psychology of the teacher-disciple relationship and recent changes to it.

History

“Guru” is a classical term and role in Hinduism. It has several meanings including “weighty” and “dispeller of darkness” (Grimes 1989, p. 133). In the corpus of the earliest texts in Hinduism, the Vedas, the term is used in the philosophical Upanishads, where it describes a male figure who has ultimate knowledge. Teaching, knowledge, initiation, and devotion are hallmarks of the guru in these texts (for these terms as describing distinctive guru paths, see Cornille 2005). The earliest references are found in two Upanishads that probably date to about 300 BCE. In the Mundaka Upanishad, a “great householder” named Shaunaka approached the Vedic sage Angiras and asked him: “Blessed one, what must one know for [knowledge of *brahman*, the ultimate] to become known?” (MuU 1.1.3; Roebuck 2003, p. 319). The sage provided a detailed reply, which included a description of the necessity to become detached from the world and its swirl of action

through teaching by a guru who is centered in the ultimate principle, *brahman* (MuU 1.2.12; Roebuck 2003, p. 322). A second early reference is from the Shvetashvatara Upanishad, which refers to knowledge of *brahman* as a “supreme secret” that “should not be given to one who is not at peace, nor yet to one who is not a son or a student.” The text also speaks of the necessity of devotion towards both god and guru (SU 6.23; Roebuck 2003, p. 315).

Other classical texts apply these teachings to the life of an upper-caste boy. His studenthood, which transitions him from child to adult, is spent with a guru. Initiation (*upanayana*) takes place for boys of the permitted castes between the ages of 8 and 12. It is an important life cycle rite (*samskara*) that initiates the boy into three domains: human society, study of the Veda, and practice of the fire sacrifice. It transitions the boy from biological birth to social status, replacing the mother (Smith 1986, p. 67). It transforms the boy through sacred knowledge imparted by a guru, with whom the child was said to have a more intimate relationship than with his biological father (Smith 1986, pp. 73, 75–76).

Living with the guru, known as *gurukula*, highlights the seriousness of the relationship and the teaching for boys, while it indicates that this system excluded young girls. Girls only left their family homes after marriage and after puberty – marriage is the most important *samskara* for girls, and it is the counterpart to the boys’ *upanayana*. When we hear of educated women in classical Indian tradition, they are firmly located in the family context. For example, the female sage Gargi Vachaknavi, who acts as a guru to male disputants in a debate in one of the earliest Upanishads, the Brihadaranyaka (ca. 700 BCE), is not represented as having studied with a guru; rather, she is in the family line of the renowned sage Garga. Later texts in which women are explicitly portrayed as gurus, such as the *Yoga Vasistha* (YV) and the *Tripura Rahasya* (TR) (both ca. thirteenth century CE), represent them as wives who are gurus to their husbands, again joining women’s knowledge with family location.

This suggests that for women family is *gurukula* – one learns from a relative who is a sage, or one takes spiritual instruction together with one’s husband from a guru (Pechilis 2012).

These same stories reveal that female gurus added a new dimension to knowledge acquisition by joining spiritual knowledge to personal experience in the world (Pechilis 2012). Within the dominant tradition of male gurus, personal insight is valued in the context of structures such a guru lineage, received teachings, and emulation of a specific guru as practiced in the intimacy of the *gurukula* system. In contrast, a prominent theme in the tradition of female gurus is personal experience both in the sense of independent spiritual realization outside of initiation in a lineage (many female gurus are self-initiated) and a pragmatic orientation that relates experience of the world to spiritual knowledge. Personal experience was especially significant to women and served as a cornerstone of their authority since they were not originally included in the definition of guru; thus, instead of relying on the de facto qualification by gender open to men, women who wished to have the authority of a spiritual teacher (guru) innovated with what was at hand (Pechilis 2004, 2012).

Stories of historical female gurus from the sixteenth through the eighteenth centuries make it clear that for a woman to be publicly known as a guru was controversial (Pechilis 2004, 2012). This barrier was definitively breached by female gurus in the mid-twentieth century who were supported by men and became internationally famous, such as the Mother (Mirra Alfassa 1878–1983, who was the appointed successor of Sri Aurobindo) and Anandamayi Ma (1896–1982, whose husband was her disciple; see Hallstrom 1999, 2004). Contemporary female gurus have a very public presence which they enhance by a pronounced emphasis on public service (*seva*) well beyond the traditional devotional service of keeping up the ashram; female gurus today have established social service agencies such as schools for children, hospitals, food programs for the poor, and prison programs (Pechilis 2004;

Saha 2007; Warriar 2005). Spiritual growth is thus intimately linked both to personal experience in the world and public social service in the modern path of female gurus.

Psychological Aspects

For the devotee, the path is one of transformative personal experiences guided by a guru. Classically, the aim of the guru path is the breakthrough in consciousness constituted by the realization of *brahman* (ultimate reality). This may be described in diverse ways, but a common one is that the guru leads the devotee to experience the unity that underlies the multiplicity of phenomena. This path is in many ways the antithesis of individuation. The process is to restore the *citta*, “the fundamental concept in the Hindu model of the human psyche” that is “very similar to the id,” to its natural state “in which its fundamental aim of ‘I’ awareness and the non-duality of ‘I’ and ‘other’ can be realized” (Kakar 1978, p. 12):

The presence of a guru to guide and monitor this process is essential. But the guru’s function is not to help to strengthen the ego’s autonomy or to enlarge its domain through insights into the hidden reaches of the mind. Rather, given the goal of calming *chitta* and the gradual merging of the ego and the (transformed) id, the guru’s role . . . is to sanction and facilitate this process of integration while all the while keeping a watchful eye on the “patient’s” ego lest it be prematurely engulfed. The presence of the guru provides the necessary support against the danger of psychotic breakdown. Unlike the alert, sanctioning support conveyed in words in most Western psychotherapies, the guru’s support is given through “look, touch and silence” – the language of the *citta* (Kakar 1978, p. 25).

From a Jungian perspective, there is a “feminization of the psyche,” in which “the feminine is both an aspect of divinity as well as a psychological experience . . . in which human consciousness must put itself into a receptive state in order to experience the divine” (Ahmed 2002, p. 84). The guru orients the ego to the divine inner Self.

Traditionally, surrender and loyalty are due to the guru, which amplifies the vulnerability of the devotee within a relationship that is in many ways comparable to a relatively common power differential (parent–child, teacher–student, boss–worker). The female gurus offset this vulnerability by embodying the nurturing persona of mother, evident in their titles (*ma*, *amma*) and behavior (such as Ammachi’s hugging) (Charpentier 2010), and by the public dimension they cultivate, such as visibility, accessibility, service, and teachings on their websites. Controversial aspects of the 1960s popular male gurus’ paths, such as a closed and secretive residential campus, are outmoded. Still, to what extent a specific guru operates in an authoritarian mode and a specific devotee’s response to a guru renders the guru authoritarian for her or for him does need to be assessed, since there remains the potential for the devotee to be overwhelmed by the relationship (Cornille 1991, pp. 23–30; Kramer and Alstad 1993; Storr 1997).

Significantly, there has been a healthy skepticism of the guru in Indian tradition, especially on the issues of the acquisition of money and sexual exploitation. Also, it is worth remembering that, in the traditional model, study with the guru prepared a man to move into a healthy, socially meaningful life of work and marriage; it was not generally speaking an end in itself. These nuances, coupled with female gurus’ emphasis on life experiences, are now beginning to inform western reflections on experiences of the guru path. What we see emerging are personal critical reflections that more calmly and less polemically reflect on areas of disappointment in or perceived limitations of the guru, written by former devotees who reflect on their experiences with the guru in the context of a longer view of their own evolving life experiences; I have called these a “discourse of constructive disappointment” (Pechilis 2012, p. 127). Such reflections have emerged mainly around female gurus, for example, Gurumayi of Siddha Yoga (Caldwell 2001; Szabo 2009) and Gurani Anjali of Yoga Anand Ashram (Chapple 2005), although the genre includes reflections on experiences with male gurus (Gold 2012).

Hinduism

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

Hinduism has its roots in the fusion of two ancient cultures, the Aryan and the Indus Valley, resulting in the formation of the Indian civilization in the second millennium BCE. This mixture entails the inculcation of the Aryan nature deities or *devas* including Agni as fire and altar, Indra as storm and warrior, Vayu as wind, Ratri as night, and Surya as sun. These deities appear in some of the earliest hymns dating possibly to 1500 BCE. The hymns relate a mystical bond between worshiper and the natural world indwelt with spirit. The *Brahman* or supreme Godhead has special qualities as one from whom the cosmos comes forth and moves (*Katha Upanishad*, 2.3.2). His power “reverberates like thunder crashing the sky,” and those who “realize him” go beyond the sway of death (*Katha Upanishad*, 2.3.2). Priests called brahmins used hymns as part of worship and ritual sacrifice. They also produced commentaries to explain the meaning of religious rituals. Together with the hymns, they constitute the Hindu

scripture, *Veda* (Sanskrit, *vid*, “to know”), which occur in four family traditions: Rig, Sama, Yajur, and Atharva. Each of these traditions consists of two parts. The first, *karma-kanda*, contains the hymns and interpretations of the sacred rituals. The second part of each tradition, named *jnana-kanda*, contains wisdom material addressing fundamental questions about the meaning of life and the nature of the Divine. The *jnana-kanda* includes the Upanishads, which translates “sitting down” – a reference to the student sitting attentively at the foot of the illumined teacher who gives inspiration based upon personal experience. Ancient sages composed individual Upanishads, ten of which are thought to be the “principal Upanishads” according to the prominent eighth-century mystic named Shankara. The Upanishads are unique in the Vedic tradition as writings which are introspective with a focus upon human consciousness. According to the *Mandukya Upanishad*, there are four kinds of consciousness. In the first, called Vaishvanara, one lives with all the sense turned outward, “aware only of the external world” (3). In the second, Taijasa, one lives in a dreaming state with the senses turned inward to enact the “impressions of past deep and present desires” (4). In the third state of consciousness, Prajna, one exists in deep sleep of neither dreams nor desires, neither mind nor separateness (5). In the fourth state of consciousness, there is neither inward nor outward, but a beyond sense and intellect “in which there is none other than the Lord. He is the supreme goal of life. He is the infinite peace and love. Realize him!” (7). In Hinduism Aum (OM) stands for the supreme reality and occurs as a symbol for past, present, and future. It is the symbol of the Godhead, and by realizing it one finds “complete fulfillment of all one’s longings.” It is of the “greatest support to all seekers. Those in whose hearts OM reverberates/Unceasingly are indeed blessed/And deeply loved as one who is Self” (*Katha Upanishad*, 1.2.16). According to the *Aitareya Upanishad*, “the self,” which is inseparable from Aum, existed before all other things, and it is the self who creates all other things – the worlds, Purusha (God), the elements of earthly existence, and human creatures (1.1.1 f.). The self is realized through a personal desire to

know the self: “Those who long for the Self with all their heart are chosen by the Self as his own” (*Mundaka Upanishad*, 3.2.3). The self does not come through the intellect, discourse, or the study of the scriptures (*Mundaka Upanishad*, 3.2.3). To realize the self is to enter into a higher state of consciousness, breaking through “the wrong identification that you are/The body, subject to birth and death” (*Kena Upanishad*, 2.4). To see the self in all goes beyond death (*Kena Upanishad*, 2.5). The Upanishads have as their starting place mystical experience and the realization of the self comes through concentrated attention given to the meaning and significance of such experiences. The overall movement of Hinduism concentrates inwardly toward intense introspection and a heightened state of “illumination.”

Hinduism and Psychoanalysis

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

Psychology is no longer limited to the study of the conscious mental plane, but it has now moved beyond it and starts studying the activities of the subconscious state. This move is actually an indication that the activities of mind and

consciousness are too complex to be understood only through a physical scientific approach, and it entails that a holistic approach, incorporating religious and cultural studies, will further help in finding out the unanswered questions. The results of this marriage between psychology and religion are quite fruitful as they have not only cleared the misconceptions associated with religion but also paved a path for the inclusion of cultural differences in psychoanalysis. The atheists argue that religion is just organized superstition, religion is a tool to promote patriarchy, science and religion are incompatible with each other, and alike. However, there are evidences that *yoga nidra* “divine sleep” also known as “going-to-sleep stage” in Hinduism has been applied by the US Army to help soldiers to recover from post-traumatic stress disorder (Nidra 2004). The remaining chapter will discuss how religion and psychology are interconnected with each other.

Discussion

The Hindu yogic tradition provides a detailed commentary on the processing of mind and consciousness which is not only relevant to religious significance but also helpful in providing a deep insight into modern psychology. Freud, Jung, and other prominent psychologists claim that the mind is actually submerged, and most of its functioning is unknown to us. Quite often, the psychologists employ the metaphors of an iceberg and Titanic to show how powerful is hidden subconscious state of mind. Similarly, Hindu yogis call these hidden mental forces *samskaras*. Both in Hinduism and psychoanalysis, it is believed that the subconscious state is more powerful and potent than the conscious state so much so that the later one is guided and even controlled by the previous one. In Hinduism, the *rishis* “seers” and *yogis* practice to observe the untrained tendencies of the mind.

Psychoanalysis as a literary theory is employed to interpret the religious folktales and myths. The classical psychoanalytic readings of Lord Ganesha mythology inform us that the Ganesha narrative is associated with the Oedipal themes, such as castration, maternal identification, erotically charged adoration of the mother, and

subservience, and such misreadings make a generalization on the Hindus and end up making a racist comment that Hindu religious narratives are the hallmarks of the Hindu male psyche (Meckel 2009). However, Girindrasekhar Bose revised and relativized the theory of the Oedipal complex, which is supported by his theory of opposite wishes. He claims that normal male development in Indians does not produce Oedipal hatred or castration anxiety (Meckel 2009).

In the light of the hermeneutic tradition, Bose’s interpretation is an appropriation of psychoanalysis in India. He also wrote several essays on traditional Hindu psychology and published a translation of Patanjali’s *Yoga Sutras* (Meckel 2009). Following a Sanskrit phrase *Vasudhaiva Kutumbakam* “the world is one family,” of the *Maha Upanishad*, Bose sees individual in harmony with other human beings, animals, plants, and nature, and there is no conflict with the outside world. Freud once wrote a letter to Bose, saying: “As long as I can enjoy life, it will recall to my mind the progress of Psychoanalysis s [,] the proud conquests it has made in foreign countries . . .” (Ramana 1964).

Like any other theories, the classical theory of psychology and the theory of psychoanalysis have also witnessed many changes within them. Freud changed his theory of one basic urge of sex (pleasure) to a theory of two basic urges – life instinct and death instinct – and further claims that human life is a struggle between these two forces. Hindu psychologists, however, do not agree with the view that a human being has a destructive tendency. Instead, they claim that suicide, war, terrorism, jihad, and all other such destructive tendencies are an expression of the abnormal mind. When some atheists equate religious self-abnegation and sacrifice to death and destruction, Hindu psychologists argue that it is an unnecessary and uncalled-for generalizations.

Hispanic American Pastoral Counseling

Carlos Velazquez-Garcia

The Psychotraumatology Institute, San Juan, PR, USA

Culture and Diversity

The term Hispanic or Latino people does not do justice to the diversity that characterizes the Latino people state Medina and Montilla (2006).

The US Census Bureau in 2010 defines the designation Hispanics as follows:

(Referring) to persons who trace their origin or descent to Mexico, Puerto Rico, Cuba, Spanish speaking Central and South America countries, and other Spanish cultures. Origin can be considered as the heritage, nationality group, lineage, or country of the person or the person's parents or ancestors before their arrival in the United States. People who identify their origin as Hispanic or Latino may be of any race.

This definition emphasizes the presence of the Spanish culture and heritage in the ancestry of the addressed population. Nevertheless, Medina and Montilla (2006) would counter: "Latino Population is a polyculture combining a very heterogeneous and multicolor group of people with a combination of ethnicities, an array of languages, a variety of religions and of diverse socio economic and educational status that although diverse maintain distinctive features and principles that make it "one" particular people." In the "official" definition of Hispanic American, the communality of language is stressed over the ethnic and racial diversity. This might induce service

providers, be them ecclesiastical or otherwise, to develop initiatives insensitive to the rich diversity within the Hispanic American population. Some Hispanics have lived in North America for hundreds of years prior to 1776 and others have a more recent arrival as illegal or undocumented immigrants.

The emerging importance of the Hispanics is underscored by the findings of the US Census Bureau in 2004. It reports that as of July 1, 2003, there were 39.9 million Hispanics in the USA, not counting 3.9 million Puerto Ricans living in that territory of the USA. The composition of this Hispanic population was 66.9% of Mexican origin, 14.3% Central and South American, 8.6% Puerto Rican, 3.7% Cuban, and 6.5% are of different Hispanic origins. It is expected that by 2050 Hispanics will represent 25% of the population.

Religion and Demography

A closer look at the Hispanic Americans is provided by the *Pew Forum on Religion and Public Life* in their report of 2007: *Changing Faiths: Latinos and The Transformation of American Religion*. The Forum found that more than two-thirds of Hispanics (68%) identify themselves as Roman Catholics.

The next largest category, at 15%, was made up of born-again or evangelical Protestants. Nearly one-in-ten (8%) Latinos do not identify with any religion. They also noted that differences in religious identification among Latinos coincide with important differences in demographic characteristics. For example, Catholics are a more heavily immigrant population than evangelicals.

Regarding religious practices and beliefs, for the great majority of Latinos, regardless of their religious tradition, God is an active force in everyday life. Most Latinos pray every day, most have a religious object in their home, and most attend a religious service at least once a month. By significant majorities, Latinos who identify with a religion believe that miracles are performed today just as they were in ancient times. For Latinos, God is alive and acting in their mist.

Positive Characteristics: Familismo, Compadrazgo, Personalismo, Community, and Popular Religiosity

The Hispanic community has positive characteristics that contrast with its surrounding culture. Prominent among these is the importance of the family vs. the hyperindividualism in the surrounding culture. Family is the primary source of support, guidance, care, and healing in the Latino population. Family is seen as a community of people connected by blood or adoption, marital agreement, or emotional bonds.

In this respect, Hernandez et al. (2010) also note the institution of the *Compadrazgo*, that is, the selection of non-blood relatives for co-parenting for life, vs. the isolationism from nonrelatives in the dominant culture. As in the larger culture, the family is confronting challenges and is increasingly vulnerable to disruptions, breakdowns, and erosion of values. Nevertheless, the Hispanic family is a sturdy, yet flexible, and resourceful institution that confronts these challenges with resiliency.

Along with the importance of the family and the institution of *Compadrazgo*, we find *Personalismo* which is based on the cultural idea that individuals are valued more than material belongings. *Personalismo* can be described as the partiality for close personal relationships. It privileges very personal approaches over against impersonalism. In a Hispanic parish, a phone call will not suffice, but a visit will. The primacy of the communal and close personal relationships inform every community, be it the church as community or the neighborhood as a larger community.

Goizueta (2009), a Cuban-American theologian, in his book "*Caminemos con Jesús*," points out that the popular religiosity of the Hispanic Americans serves as a powerful source of identity. He distinguishes "popular religiosity" from official church dogma or rituals, as the rituals and symbols that arise from within the peoples' religious practices in community.

Hernandez et al. (2010) point out that closely knit families and a high rate of church attendance correlate highly with general health. These characteristics are of paramount importance in

determining the locus, the center of the pastoral care agenda and its initiatives.

A Contextual Theology Informs the Agenda of Hispanic Pastoral Counseling

Liberation Theology is a theological current that began in Latin America after the Second Vatican Council and the Medellin Conference in Colombia, 1968. The council opened October 11, 1962, and closed on December 8, 1965.

Boer (2007) argues that the political ideologies of liberation emerged in the Third World in centers of exclusion and poverty in the occidental world around the 1960s. Fundamentally, it was the fruit of an explicitly theological work. An example of this fermented area of theological work was the labor of Gustavo Gutiérrez. His classic book *Una teología de Liberación* came about in 1969, precisely 1 year before James Cone's (1970) book *The Black Theology of Liberation*.

The methodological interest of this theology is the examination of reality from the perspective of the oppressed, from the context of oppression. The salient characteristic feature of this liberation theology is the primacy of praxis.

The goals for transformation emerge from the needs of "the here and now," a society with equity and justice where reciprocity is predominant over the dominion of others and where the exploitation of humans against humans is abolished. In the theology of liberation, we observe the preferential option for the exploited, the oppressed, and the poor. The major ethical task is for the practice of social justice and the abolishment of exploitation.

Context and Community: Poverty, Racism, Oppression and Marginalization, and the Agenda for Hispanic Pastoral Counseling

Poverty

The US Census declared that in 2010, 15.1% of the general population lived in poverty. Since the 1960s, the United States Government has defined poverty in absolute terms. The "absolute poverty

line” is the threshold below which families or individuals are considered to be *lacking the resources to meet the basic needs for healthy living, having insufficient income to provide the food, shelter, and clothing needed to preserve health*.

The breakdown figures were 9.9% of all non-Hispanic white persons, 12.1% of all Asian persons, 26.6% of all Hispanic persons (of any race), and 27.4% of all black persons lived in poverty. That is, the percentages of Hispanics or Blacks living in poverty in 2010 were three times larger than the percentage of all non-Hispanic white persons. This inequality occurs in ethnic and racial groups that have lived for centuries in the USA and historically have been the object of oppression, discrimination, and marginalization.

Priorities

The above negative socioeconomic indicators, which are the context of the Hispanic community, sets the agenda for Pastoral Care and Counseling: food, shelter, legal immigrant status, adequate livelihood, safety from violence, and health-care promotion and breaching the gap of access to health care. The above calls for justice and compassion, love, and empowerment, as Chinula (2009) and Kuyawa-Holbrook and Montango (2009) propose.

Pastoral Care and Pastoral Counseling

Given the context of the Hispanic community, pastoral care is inextricably linked to justice and compassion. “Pastoral Care becomes not what one trained professional does for the hurting, but what the community of faith does for each other,” De La Torre (2009) states. We must note that trained pastoral counselors have been a rarity among the ethnic minorities. Chinula (2009) found that in 1993 of the total of 3,187 members of the American Association of Pastoral Counselors (AAPC), only between 25 and 30 were from the ethnic communities of African American, Hispanic, and Asian. This represented only about 0.78–0.94% of the total membership.

“Because of its primary focus on the individual,” Chinula (2009) affirms, “the hyper-individualistic model (of Pastoral Counseling) lacks serious critical social theory and analysis

to inform its praxis.” He further notes “the hyper-individualistic” model lacks a serious role for the church in its intervention repertoire.” Pastoral Counseling could be done outside of the local church, or parallel to it, not necessarily from within it. Furthermore, “the interrelated nature of context and community suggest that pastoral care is a holistic practice that attends to whole persons—mind, spirit and body-in community” as Kuyawa-Holbrook and Montango (2009) note.

Again, Chinula (2009) proposes that more sociocultural oriented perspectives should guide Pastoral Counseling rather than the more “hyper-individualistic” models. He names the following five alternative models: the individual psychology of Alfred Adler, the structural perspective of Salvador Minuchin, feminist psychologies, ethnic psychologies, and the growth empowerment model of Howard Clinebell.

We must note that at present, there are significant efforts to leverage the unique strengths of faith-based communities to decrease disparities in mental health and substance abuse. The American Association of Pastoral Counselors recently developed training to prepare *Pastoral Care Specialists*, which do not require the same graduate-level academic preparation as the pastoral counselors, as another effort to eliminate mental health disparities that underserved populations suffer.

Another initiative has been the *Mental Health and Substance Abuse Curriculum for Laity* by Uceda et al. (2011). The goal is to train members of faith-based communities to identify persons in need within the church and their communities and develop a network of government, non-government, and church-related services be them clinical, social, familial, or behavioral in order to make appropriate referrals. These efforts appear pertinent and promising since they are faith based and the resources human and institutional function within the community.

Historical Jesus

Daniel Nii Aboagye Aryeh

Perez University College, Winneba, Ghana

The historical Jesus research is critical in how the Christian faith is appropriated and practiced, a combination of acts and thoughts for a holistic religious life. So far, there had been various quests for the historical Jesus: the old quest, no quest, new quest, the third quest, and renewed quest (Jacobs 1996: 105). These quests were not issues of grave concern in the Early Church until the emergence of social scientific study of religion in the nineteenth century. It opposed the orthodox views concerning the historical Jesus. Attempts were made to suppress the social scientific exploration of the historical Jesus. “Deviation from orthodox stances espoused by religious authorities has always been negatively viewed and often suppressed” (Spilka 2016). It is both a psychological and epistemological issue focused on human behavior influenced by cultural lenses on how we know and provide empirical evidence to support what we know (Dentice 2018).

The old quest was influenced by the enlightenment, rationalism, and existentialism of the nineteenth century, where Rudolf Bultmann (1963) and others argue that there are discrepancies and inconsistencies in the presentation of Jesus by the Early Church and the authors of the New Testament document. Jesus was apologetically presented to be above all other competing religious intermediaries, and theologically projected as the

Messiah of God, which Jesus did not emphatically claim during His public ministry. In other words, the concept of the historical Jesus has gone through the process of amplification by the Early Church, “a method by which the deeper meaning of archetypal images, symbols, and dream-figures is expanded through their association with mythological, cultural, and religious motifs and metaphors – a process that has particular application within a psychotherapeutic and developmental context” (Davis 2018).

In the no quest phase, the emphasis was on what is important for the church, which is the death and resurrection of Jesus. Issues of history are not important for the faith (Patterson 1996). Alternatively put, faith in the historical Jesus must be realistic for life and nurture today or must respond to existential needs (Dentice 2018). The argument of the “no quest” seems to build on the old quest view that the presentation of Jesus by His closed associates was aimed at adducing faith in Jesus, not the narration of historical and chronological sequences of events but the selection of events that would build confidence in Jesus. Käsemann (1964: 33–34) did not allow the view of the “no quest” to prevail. He began a research into what had become known as the “new quest.” Its thesis was that there is a close relationship between the Jesus of history and the Christ of faith. It is an attempt to remove the psychological wedge in the minds of previous propositions concerning the person of Jesus and how others described Him.

Generally, Geza Vermes was credited as the initiator of the third quest in 1973 with the publication of the second edition of his work, *Jesus the Jew: A Historian's Reading of the Gospel*, in 1983. According to Funk (2005), the “third quest” represented the view of some group of “scholars whose work gives allegiance to a certain set of generalizations about the search for the historical figure of Jesus.” The “third quest” was ecumenical in nature and analyzed the sources for the study of the historical Jesus, and it gave critical attention to the miracles of Jesus and His charisma (Meier 2003: 459–487). The

psychological inputs for the third quest were expanded to achieve “*active imagination*,” thus providing a channel through which greater psychological cohesion and wholeness can be achieved” (Davis 2018). The aim of the “renewed quest” was to move back into the initial attempts by the historical Jesus study to distinguish between the words and deeds of Jesus and those ascribed to Him by the Early Church (Funk 2005).

Besides the systematic study of the historical Jesus in the canonical gospels, extracanonical gospels, and other genres of the New Testament, scholars have also focused their attention on how individual gospels presented Jesus to their audience. Lukan scholars have attempted to examine evidences in the gospel to construct the historical Jesus as a prophet and its psychological impact on the audience/recipients. There are four views (O'Toole 1995:452–465): (i) the historical Jesus is the eschatological Christ (Messiah); (ii) the historical Jesus as a prophet-teacher, like Moses; (iii) Jesus as the Servant of YHWH; and (iv) Jesus as the Elijah-type prophet. These religio-psychological constructs of the historical Jesus were based on Luke 4:16–30, seen as an intertexture echo of Isaiah 58:6; 61:1–2 and Deuteronomy 18:15. It demonstrates the parallels between the ministry of Moses, Elijah, the expected Messiah, and Jesus. It psychologically depicts that either the author of Luke or the implied reader is familiar with the Moses, Elijah, and messianic traditions of the Old Testament. However, constructing the historical Jesus as a prophet based on Luke 4:16–30 and its intertextual passages limit Luke's presentation of Jesus as a prophet mighty in words and deeds. It is imperative to study Luke's presentation of the historical Jesus as a prophet by analyzing Luke 4:16–30 in addition to 7:11–17; 13:33; 24:19; and other implicit passages to holistically appreciate Luke's construct of the historical Jesus and its impact on the psychology of the implied reader. My procedure is similar to that of N. H. Taylor and Nicholas Taylor (2003:105–126) in their study of the historical Jesus in the writings of Paul. They first and foremost examined each reference to

Jesus by Paul and finally drew a conclusion on Paul's view concerning the historical Jesus.

Jesus as a Prophet Mighty in Words and Deeds in Luke

The author of the gospel of Luke gave considerable attention to the activities of the Holy Spirit and prophecy through key personalities in the account. It resonates with the Jewish idea and psychology of synonymy of the Holy Spirit to prophecy and prophets (Davies 1945: 241–254). Kay (2016) referred to this phenomenon in religious experience as “individuation process” that brings spiritual transformation to humans. From the beginning of the gospel, the author indicated that the birth of influential persons – John the Baptist and Jesus – was a result of the prophecy by the angel Gabriel (Lk. 1:5–38). Roger Stronstad (2012:40) states that “...dramatic in this atmosphere of piety and cult, an unprecedented outburst of the charismatic activity of the Holy Spirit punctuates these nativity scenes.” Luke connected the account of the prophecy concerning the birth of John the Baptist to the most cherished Jewish narratives of the birth of Samuel and Samson (1 Sam. 1:11; Judges 13:4–5), to probably show continuity and connectedness between the two Testaments (Berkey 2013:47–62).

At the dedication of Jesus in the Temple, the author did not indicate when it was prophesied to Simeon that he will not die until he sees Jesus. Nonetheless, the Spirit was said to have inspired Simeon to come to the Temple at the time (Lk. 2:25–35). Anna was referred to as a prophetess who prophesied concerning the redemption of Israel through Jesus (Lk. 2:36–38). The experience of Jesus at the baptism by John the Baptist, when the author said the heavens were opened, the Holy Spirit descended upon Him, and there was a voice affirming the unique sonship of Jesus to God. These resonates with persons whose psychology was formed by the experience of Jacob at Bethel, when he saw in a dream that the heavens were opened, angels descending and ascending, and YHWH affirmed His Lordship over the

ancestors of Jacob (Gen. 28: 10–22). According to Marshall (1978:154–155), Jesus' experience at the baptism is the prophetic fulfillment of Isaiah 42:1. Marshall's assertion may be influenced by the concept and psychology of “servant” in Isaiah's text and the affirmation of Jesus as the “servant” of YHWH in Luke's text.

In the Synagogue at Nazareth, Jesus was presented as reading a text in Isaiah 61:1–2 and claimed that the text concerns Him and that it has been fulfilled (Lk. 4:18–30). But the audience began an inquiry into the Jesus of history and asked about the parents of Jesus who they knew, an indication of confusion in the developmental religious trajectory of Jesus in the psyche of the audience (Kay 2016). While the audience insisted on the Jesus of history, the author of Luke argued that Jesus cited a socioreligious maxim that a prophet is not honored in his hometown. Luke made reference to the Elijah story of the widow at Zarephath and the healing of the leper (Naaman) the Syrian, to justify the selective acts by prophets, which is motivated by faith not history, psychological, and biological relationship.

At the raising of the widow's son at Nain, the audience exclaimed that a great prophet had risen in Israel (Lk. 7:16). Rhetorically, the reaction of the audience to the miracle suggests that they were drawing from a conceptual framework of prophetic tradition in the Old Testament or Jewish tradition, a conceptual location in the psychology of the recipient – Theophilus (Lk. 1:1–4). It reflects the raising of widows' sons back to life by Elijah and Elisha (1 Kgs. 17:17–24; 2 Kgs. 4:18–37). In Luke 13:31–35, the author attributed a statement to Jesus, which outlined the miraculous works of Jesus, and likened Him to the maxim that prophets do not die outside Jerusalem. By this Jesus presented Himself as a prophet. However, it is not very clear where the maxim was taken from. Marshall argued that it was a summary of the suffering and death of prophets during the Deuteronomistic period or it was part of wisdom sayings in Jewish tradition (Marshall 1978: 754).

Some followers of Jesus including Cleopas emphatically referred to Jesus as a prophet

mighty in words and deeds (Lk. 24:19). The testimony of these followers is critical to the assertion of this study because it was toward the end of the ministry of Jesus and these followers might have observed His words and deeds for some time. In other words, He is not a prophet-teacher only, or a charismatic-prophet, but a prophet who combines teachings and charisma mightily. The link of Jesus to His hometown – Nazareth – as a prophet logically and psychologically makes reference to His famous statement in the Synagogue in Nazareth earlier in the gospel (Lk. 4:16–30). Luke’s presentation of the ascension of Jesus, which comprises of a discussion between Jesus and His disciples, blessing of the disciples, and final departure (Lk. 24:50–52), is a recontextualization of the ascension of Elijah and the discourse between himself and his disciple – Elisha (2 Kgs. 2:1–12).

The burgeoning discussion shows that the author of Luke’s gospel had foreknowledge or a psychology concerning Isaiah and the Elijah-Elisha prophetic traditions. These traditions were recontextualized by the author of Luke to construct the historical Jesus. He clearly stated his objective in the prologue that he sets off to undertake a research to complement what the recipient had earlier taught or heard. The use of παραδίδωμι (traditions) in Luke 1:3 refers to a lay down tradition, which Luke used to authenticate the words and deeds of Jesus. Luke referred to well-established and popular primary sources in the psychology of the recipient to compose his gospel about the historical Jesus. Dillon (1981:204:227) observed that “the traditions and his management of them, and not his personal experience, constitute his historian’s credentials.” This was an appeal to authoritative religious tradition, to give and authenticate the deeds and words of Jesus so that they could easily be accepted by the audience/recipient.

Although Steve Moyise argued that Luke 4:16–30 is not an allusion to Isaiah 61:1–2 because it omitted and imported “release for the captives” from Isaiah 58:6, hence, it was the summary of the preaching of Jesus in the Synagogue and not the quotation of Isaiah 61:1–2 (Moyise 2009: 249–270). Apparently, Isaiah 61:1–2 is not

a direct word-for-word quotation based on the LXX. It is a recontextualization that does not necessarily require word-for-word reproduction of the text. A psychological exercise was based on the memory of the author. However, the fact remains that the author of Luke is quite familiar with the text of Isaiah. Luke also demonstrated a foreknowledge of the Elijah-Elisha prophetic tradition and mimicked the miracles of the historical Jesus in a like manner to show continuity between Israelite prophets and scripture and the ministry of Jesus as a prophet mighty in words and deeds (Litwak 2012:147–190). Luke psychologically fixed the historical Jesus in a jacket like Elijah of the Deuteronomistic tradition, who was a spokesperson for God and performed miracles. This was not the Elijah *redivivus* (returned) as prophesied in Malachi 3:1; 3:23, believe to be John the Baptist, who did not perform miracles (Croatto 2005:451–465). To sum up, Luke has shown knowledge and psychology of the Isaianic text and the Elijah-Elisha prophetic tradition, probably, the LXX version due to its popularity and use by the Early Church and constructed the historical Jesus according to these traditions. In that regard, he did not show interest in presenting the Jesus of history. It is a hermeneutical psychological model for the search of the historical Jesus and the interpretation of the gospel of Luke. Luke presented the historical Jesus as a prophet, who performed miracles and also taught by making reference to earlier scriptures in the psychology of the audience, which was a norm among prophets and philosophers (Poirier 2009: 349–363; Davies 1945: 245).

Holiness Tradition

Georgios N. Maragkoudakis

Department of Theology, Faculty of Theology,
Aristotle University of Thessaloniki,
Thessaloniki, Greece

Holiness or perfectionist beliefs and teachings have existed since the first century, for e.g., in the works of apostolic fathers like Ignatius, Polycarp, and Clement of Rome, where Christian holiness comes from fulfilling the law of righteousness. This tradition was kept alive through the monastic way of life, which roughly began in the third century. Concerning the Holiness Tradition/Movement, which was the dominant force within nineteenth century American Protestantism, one can say that it was founded during the first half of the nineteenth century by Methodists Timothy Merritt (a preacher, who edited *The Christian's Manual: A Treatise on Christian Perfection* in 1824) and two sisters, named Sarah Worrall Lankford (who founded the "Tuesday Meetings for the Promotion of Holiness in New York City" in 1836) and Phoebe Worrall Palmer (who gained leadership of the meetings after 1839). The Tuesday meetings were attended by Episcopalian, Dutch Reformed, Baptist, Congregationalist, Presbyterian, etc., leaders and their aim – being also the purpose of the holiness movement – was to revive certain elements of the Wesleyan doctrine of "Christian perfection"/"the higher Christian life"/"perfect love," which all Christians could and should reach, through an experience known as "entire sanctification" or the "the second blessing," in other words, to bring about the sanctification of its adherents through a definite second work of grace subsequent to conversion. The Holiness Movement stressed the idea of holiness through social reform activities, mainly in the areas of abolitionism, of the role of women, of the poor and the oppressed, of peace and of Ecumenism, as it was hoped by some that the new tradition would bring Christianity to unity (Dieter 1996).

A variety of strands of perfectionism began forming in the Holiness movement, although the

one of the two sisters was probably the most inspiring. One could mention the name of Thomas E. Upham, an American mental philosopher, professor at Bowdoin College, who is regarded as the author of the first American textbook in psychology. Asa Mahan, as well, president at the Oberlin College, and Charles G. Finney, a famous evangelist, associated with the college, taught that man can totally surrender to God and live without sin (Kostlevy 2009).

One could say that the holiness pursuit began taking on denominational character with the establishment of the Wesleyan Methodist Connection (1843) and the Free Methodist Church (1860). In 1841, James Caughey, a Methodist Minister and Evangelist, started a tour in England that would last for 6 years. The first National Association camp meeting for the Promotion of Holiness is organized at Vineland, New Jersey, in 1867 and is attended by 10,000 people. In the course of time several other church groups were formed, e.g., the Salvation Army by William and Catherine Booth in 1878, the Church of God (Anderson) by D. S. Warner in 1881, or the Church of God (Holiness) in 1883. During the second half of the nineteenth century, William Taylor, an American missionary bishop of the Methodist Episcopal Church, began preaching the Holiness teachings in India, Latin America, Africa, and Asia (Kostlevy 2010).

Starting from the 1890s, more independent churches and regional Holiness denominations were founded that proposed the redistribution of wealth and the communal ownership of property. Despite the 1906 Azusa Street Revival, which brought many potential holiness adherents to the Pentecostal Church, two national Churches were organized, the Church of the Nazarene and the Pilgrim Holiness Church, which experienced worldwide growth in the twentieth century. After World War II, theological seminaries appeared in North America, India, the Philippines, Africa, and Korea. Furthermore, in 1965 the Wesleyan Theological Society was founded (Synan 1997).

According to Individual Psychology, the *striving for perfection or superiority* (Adler) is an innate, necessary, and general foundation of the development of every individual. The idea of God, though

imagined by followers of different religions (maybe even by every person) differently, seem to feed humanity with the purest conceptualization of what the final goal of perfection might be. This urge for “mastery” should be expressed in a balanced way: Wesley linked the restoration of the ability to love God and to feel God’s love with the concomitant ability to love others. For Individual Psychology neurosis, psychosis, crime, drug addiction, etc., are seen as a result of striving for superiority for the sole purpose of gaining personal power. An article named “Psychological Implications of the Doctrine of Christian Perfection with Special Reference to John Wesley’s View,” by Irv Brendlinger and Eric E. Mueller, explains that: “When the perfection is a fixed, unchanging state, it is a ritualism with pathological and neurotic elements. In this perspective, perfectionism is pathology. In pathological perfectionism, the individual’s orientation is egocentric. The focus of the person’s action is meeting one’s own physical, psychological, and spiritual needs.” On the other hand, “Perfectionism, at its highest, is not focused on the self’s needs, but the giving away of self (i.e., the investment of self into the lives of others) in the service of others” (Brendlinger and Mueller 2006). According to Individual Psychology, the “special formula” for the right way to perfection is that never can the individual be the goal of the idea of perfection, but only mankind as a cooperating community.

Holocaust

Krystyna Sanderson

The Blanton-Peale Institute, New York, NY, USA

The term holocaust, or “the Holocaust,” is most commonly used to describe the persecution and murder of some six million European Jews during World War II. The term is derived from Greek *holos*, “completely,” and *kaustos*, “burnt.” The Hebrew term is *Shoah* – “destruction” or “desolation.”

Other victims of Nazi persecution and murder included Gypsies, Russians, ethnic Poles and other Slavic people, the disabled, gay men, and political and religious dissidents, bringing the total number of victims to 9–11 million.

There is no individual psychological equivalent of the Holocaust, which stands as a uniquely horrifying cataclysm in the annals of European history and attempts to “explain” the Holocaust in psychological terms have been singularly unsuccessful. Jung devoted much attention to the study of mass psychoses and observed a “psychic inflation” of the individual in which ego consciousness is flooded by the unconscious with resulting mass psychotic behavior.

Holy Grail

David Waldron

Department of Social Science and the Humanities,
University of Ballarat, Ballarat, VIC, Australia

The Holy Grail is one of the most profound and complex psychological and historical symbols. In terms of mythology, literature, and popular culture, the grail mythos deeply permeates Western culture as a symbol of perfection, struggle, purity, and sacred quest. However, it is worth noting that despite its ubiquity in Western European culture, it was far from well known in Eastern Orthodox nations and in many predominantly Catholic regions, such as Spain and Latin America until the nineteenth and twentieth centuries.

Typically, the grail mythology, in its many forms and variations, focuses on two archetypal narratives. Firstly, there is the grail itself as a symbol of purity, completion, the divine, and plenty. In the *Parsifal* grail myth and *Arthurian* cycle, the grail serves as the panacea, curing sickness and devastation brought to the land by the ailment of the king as the spiritual embodiment of the land and guardian of the grail. The grail as a symbol of wholeness and purity reconciles the king to the source of his ailment and thus leads to the restoration of the land. This theme is well developed by Jungian analyst Robert A. Johnson who utilizes Parsifal’s search for the Holy Grail as a metaphor for the development of wholeness in masculine psychology and reconciliation between the conscious and unconscious aspects of the psyche. The absence or loss of the grail, from this perspective, represents a symbolic dissonance between the conscious and unconscious aspects of the psyche, leading to neurosis, insecurity, and depression. The grail itself becomes the symbol of psychological wholeness and well-being achieved through the completion of the quest and reconciliation with the unconscious and shadow aspects of the psyche (Johnson 1989).

The Grail Quest

The quest itself forms the second part of the grail narrative in mythology and literature. The quest is a symbolic manifestation of a spiritual pilgrimage towards psychological wholeness and well-being. The quest, comprising three levels, separation, initiation, or trial and return, serves as a parable for the growth of the psyche and the journey towards psychological wholeness and adulthood. Indeed, the narrative of quest or pilgrimage closely follows the pattern of pre-liminal, liminal, and post-liminal phases engaged in ritual and symbolism by all cultures to mark transitional phases and focal points of doubt, turmoil, and anxiety identified by anthropologist Arnold Van Gennep. In this case, the grail serves as the ultimate focal point of resolution to turmoil, unhappiness, and neurosis (Van Gennep 1960).

The Origins of the Grail Myth

There are other powerful symbolic and psychological associations to the myth of the Holy Grail. However, in part, they depend upon perceptions of the historical antecedents of the grail mythology. For example, one school of thought championed by historians and folklorists such as Roger Loomis, Alfred Nutt, and Lewis Spence is that the grail mythology is a Christianized derivation of the Celtic myths and legends surround the Goddess Cerriden's "Cauldron of Inspiration." In early Welsh literature attributed to the mythic figure *Taliessin*, for example, the vessel recovered by Arthur and his companions is a cauldron set with a rim of jewels and pearls, the fire beneath kindled by the breath of nine maidens, and it would not cook the food of a coward. Similarly, Celtic myth and folklore is replete with images of a cauldron from which issues knowledge, unlimited food and drink, or cauldron-born warriors. The cauldrons in Celtic myth are associated with a variety of gods and goddesses and serve as a symbolic womb of birth, creation, and wisdom and recur continually

throughout Celtic mythology and legends. From this perspective, the Holy Grail is a Christianized myth popularized in the twelfth and thirteenth centuries. In this sense, the grail also has powerful symbolic associations with the psychological feminine, the notion of rebirth, and the sacred mother or divine feminine (Spence 1994; Mathews 1991; Hutton 1993; Nutt 1965; Weston 1957).

Criticisms of the Grail Mythology

However, this theory of the grail's origins, and thus its symbolic associations, has come under historical criticisms. Ronald Hutton, for example, comments that aside from the superficial similarity of both being a vessel, the grail as a small dish or platter carried by a singly maiden as a symbol of purity, wholeness, and reconciliation to the divine has little in common with the gigantic cauldrons of the Celtic gods kept perpetually filled with inexhaustible food, wisdom, or cauldron-born warriors. An alternate school of thought, led by writers such as Richard Heinzel, Joseph Georing, Wolfgang Golther, and Rose Peebles, among others, suggests that the grail mythology is primarily a Western Christian invention. In particular, this school of thought links the rise of the grail myth to the overwhelming preoccupation with the doctrine of transubstantiation in twelfth-century Western Europe (Hutton 1993; Goering 2005). As the wellspring of all communal chalices, the grail became the focal point of this preoccupation with the physical manifestation of the divine and the bridging between the realm of the spirit and the flesh that distinguished Christianity from the proliferation of dualist heretical movements of this era. Thus, the grail served both as the symbol of ultimate purity and wholeness but also as symbolic bridge between the realm of the flesh and the divine, connecting humanity to the imago dei. In this sense, the grail also becomes the epitome of the struggle for spiritual transcendence endemic to Christian belief, and for that matter, the search for enlightenment and

the lapis that lay at the core of medieval alchemy and the hermetic tradition of medieval Neoplatonism (Yates 1972).

However, despite the competing historical origins of the grail mythology, in terms of archetypal symbolism and psychological association, both interpretations of the grail's origins have deeply inspired contemporary symbolic representations and interpretations of the grail myth. Indeed, there are clear antecedents within both Pagan Celtic and Christian mythic structures for the contemporary manifestation of the grail mythology. In either case, the image serves as the focal point of the mythic quest for psychological wholeness and development and the wellspring or birthplace of wisdom, nourishment, and purification. As such, it remains one of the most profound, ubiquitous, and complex archetypal forms in Western culture.

The Term, Concept, Tradition, and Theology

The Holy Spirit is a scriptural spiritual tradition, which has evolved into a doctrine, in the Christian tradition. It is present throughout the Christian Scriptures and has arisen and evolved from “the Spirit,” “Spirit of the LORD,” or “Spirit of God” in the Hebrew Scriptures. Michael Ramsay (1977, pp. 14–15) summarizes this evolution.

We see that Spirit is a part of the Hebrew theology, with the prevailing imagery of wind. Spirit is not a thing-in-itself, or a person-in-itself, or a philosophical entity in itself; it means that God himself is active in the world. He is a God at once beyond and within, the creator and sustainer of his creation, manifesting himself in particular events and persons to forward his righteous purpose, and preparing the way for its future climax. Christians believe that this climax is Jesus of Nazareth.

The term “Holy Spirit” is capitalized as a name that refers to an identity of the Divine, named God in Christian tradition. Holy Spirit is a more recent expression of the traditional name “Holy Ghost,” but they refer to the same “Spirit.” Conceptually, it has evolved to be part of the Christian doctrine of the Trinity, which is a way of understanding God as triune: God as Father, God as Son Jesus incarnate in the material world, and God as dynamic Spirit at work in the world. The Trinity is said to consist of “Father, Son, and Holy Ghost/Spirit,” with the Holy Spirit as the third element. The Trinity as a concept has developed as followers of Jesus Christ have struggled to understand Jesus in his dimension as a man, son of man

and Son of God, and in his Christ dimension as God incarnate in the world, in attempt to understand the nature of God and Jesus' relationship to God.

In Christian scriptural tradition, Luke says of John [the Baptist] who later baptized Jesus, "even before his birth he will be filled with the Holy Spirit" (Bible, Luke 1:15). The conception and birth narratives of Jesus Christ portray Mary, his mother, as a virgin chosen by God, according to the Archangel Gabriel, to be impregnated by the Holy Spirit – God active in the world (Luke 1:26–38 and Matthew 1:18–21). This story in Christian scripture is known as the Annunciation of Gabriel to Mary. From these beginnings we see Jesus the man as the physical son of Mary and the Divine Son of God, the *Son* aspect of the Trinity.

Theologically, we begin to understand God as the *Father* of Jesus, and active in the material world as the *Holy Spirit*. We see Father, Son, and Holy Spirit in relationship to each other, which forms the Trinity. We begin to understand God further as having simultaneous presence in each aspect, being triune – three in one. We observe that God is more than each aspect, and is present in the relationships between the aspects. With these understandings of God helped by the knowledge of the Trinity, we come to realize not only that God is multifaceted while being One but must also be greater in essence than the Trinity because each aspect and each relationship described within the Trinity is partial and not whole.

In the Trinity, God understood as *Father* is known only in relationship to Jesus the Christ. God understood as *Son* is known only as Spirit incarnate in humankind in the example of Jesus. God understood as the *Holy Spirit* is known only as dynamic Spirit moving on Earth. In order to be Father, God must be the sum of what is not yet created and what is created, eternal, omnipresent, omnipotent, all, and must be creator. In order to be Son in body and spirit, God must be both essence and manifestation, manifestor, and manifested. In order to be the Holy Spirit at work in the world dynamically, God must be Spirit itself in the world and outside of space and time. God must also be

the agent who determines the agency of the Holy Spirit in the manifested world. The doctrine of the Trinity has been debated about and struggled with since it became a formal doctrine. It provides a vehicle or a model to try to understand who God is, how God functions, and how God relates to humanity and through the person of Jesus Christ. We can see the dynamics of the Trinity at work when St. Peter speaks to the crowd, saying, "This Jesus God raised up, and of that all of us are witnesses. Being therefore exalted at [or by] the right hand of God, and having received from the Father the promise of the Holy Spirit, he has poured out this that you both see and hear" (Acts 2:32–33).

The elements and relationships of the Trinity are scriptural, as in these passages when Jesus speaks to his disciples. "I have said these things to you while I am still with you. But the Advocate [or Helper], the Holy Spirit, whom the Father will send in my name, will teach you everything, and remind you of all that I have said to you" (John 14:25–26). "If you loved me you would rejoice that I am going to the Father, because the Father is greater than I" (John 14:28). "I do as the Father has commanded me, so that the world will know that I love the Father" (John 14:31). "When the Advocate [or Helper] comes, whom I will send to you from the Father, the Spirit of truth who comes from the Father, he will testify on my behalf" (John 15:26). "I tell you the truth: it is to your advantage that I go away, for if I do not go away, the Advocate [or Helper] will not come to you; but if I go, I will send him to you" (John 16:7). "...When the Spirit of truth comes, he will guide you into all the truth" (John 16:13). The explicit, constructed Trinitarian model is doctrinal.

The Holy Spirit is traditionally represented as a dove descending from God in heaven to Earth (See Fig. 1). This comes from the story of the baptism of Jesus by John, identified as John the Baptist. He said to those coming for baptism before Jesus came, "I baptize you with (or in) water for repentance, but one who is more powerful than I is coming after me; I am not worthy to carry his sandals. He will baptize you with [or in] the Holy Spirit and fire" (Matthew 3:11). "And when Jesus had been baptized, just as he came up

from the water, suddenly the heavens were opened to him and he saw the Spirit of God descending like a dove and alighting on him (See Fig. 2). And a voice from heaven said, ‘This is my Son, the Beloved [*or* my beloved Son), with whom I am well pleased’” (Matthew 3:16–17) (See Fig. 3).

The Psychology of Holy Spirit

St. Paul in his first letter to the church at Corinth says, “Anyone united to the Lord becomes one spirit with him (I Corinthians 6:17)...Do you not know that your body is a temple [*or*

Holy Spirit, Fig. 3 Holy Spirit Chapel of Washington National Cathedral, Washington, DC (Photo courtesy of the Cathedral)

H

sanctuary] of the Holy Spirit within you, which you have from God, and that you are not your own? For you were bought with a price; therefore glorify God in your body” (6:19–20). Paul speaks first of spiritual union with “the Lord,” making the listener aware of his/her new level of existence in spiritual union. It is a new identity, new sense of self, new self-awareness and self-understanding, and a new way of being. Italian psychoanalyst Robert Assagioli calls this transformation into new spiritual self-

awareness, psychosynthesis (1965). Paul concludes his second letter to Corinth with relational dynamics of the elements of the Trinity and of the Trinitarian elements to the faithful followers, because of their new self-understanding. “The grace of the Lord Jesus Christ, the love of God, and the communion of [or and the sharing in] the Holy Spirit be with all of you” (II Corinthians 13:13).

Lionel Corbett, in his article *Depth Psychology and Spirituality* in this volume, says, “For

many depth psychologists with a spiritual orientation, psychology and spirituality are two perspectives on an identical reality, because the divine manifests itself by means of the psyche.” Dourley (1981) has pointed out that the psyche is sacramental, since it is a medium of connection to the sacred and it has its own transpersonal dimensions which reveal the sacred or the holy. The depth psychological approach to spirituality appeals to direct, personal experience of this level of reality, and eschews reliance on doctrine, dogma, religious tradition, or religious authority. This helps us to see how the psyche can experience the Holy Spirit as it “manifests itself by means of the psyche” or in the sacrament of baptism. The experience happens in the “transpersonal dimensions” of the psyche and manifests as “direct, personal experience.” This experience is in addition to traditional knowledge and doctrinal understanding. The nature of the Holy Spirit is such that it can be known on any of the levels on which the psyche can experience and/or know it.

In the psychology of religion, we examine the relationship between the psyche of the person and the institution and effects of religion on the person and personal psyche. The Holy Spirit can be understood psychologically as a name in the Christian religious tradition for dynamic spiritual input into the personal and collective psyche. Stein (1998, pp. 220–221) describes it this way.

The human psyche and our personal psychology participate in the order of this universe most profoundly through the psychoid level of the unconscious. Through the process of psychization, patterns of order in the universe become available to consciousness and eventually can be understood and integrated. Each person can witness the Creator and creative works from within, so to speak, by paying attention to image and synchronicity. For the archetype is not only the pattern of the psyche, but it also reflects the actual basic structure of the universe. “As above, so below,” spake the ancient sages. “As within, so without,” responds the modern soul explorer, Carl Gustav Jung.

Jung wrote an extensive treatise on the Trinity, called *A Psychological Approach to the Trinity* (1958). His overview describes the Trinity in

terms of psychology, consciousness, and experience in the person.

The history of the Trinity presents itself as the gradual crystallization of an archetype that moulds the anthropomorphic conceptions of father and son, of life, and of different persons into an archetypal and numinous figure, the “Most Holy Three-in-One.” The contemporary witnesses of these events apprehended it as something that modern psychology would call a psychic presence outside consciousness. . . a collective presence. . .

“Holiness” means that an idea or thing possesses the highest value, and that in the presence of this value men are, so to speak, struck dumb. Holiness is also revelatory: it is the illuminative power emanating from an archetypal figure. Nobody ever feels himself as the subject of such a process, but always as its object. *He* does not perceive holiness, *it* takes him captive and overwhelms him; nor does *he* behold it in a revelation, *it* reveals itself to him; and he cannot even boast that he has understood it properly. Everything happens apparently outside the sphere of his will, and these happenings are contents of the unconscious. Science is unable to say anything more than this, for it cannot, by an act of faith, overstep the limits appropriate to its nature (1958, pp. 47–48).

Ramsey has an afterthought that puts our topic in context. “Goodness has God as its author. . . Yet, for the world’s salvation, it is the work of the Holy Spirit not only to produce goodness in human lives but to lead human lives to acknowledge God as the author of goodness and to glorify Christ” (1977, p. 125).

Homo Religiosus

Todd DuBose

The Chicago School of Professional Psychology,
Chicago, IL, USA

The phrase, *homo religiosus*, refers to the idea that human existence is inherently religious. There is a long lineage of scholars that have proposed this idea, including Georg Wilhelm Friedrich Hegel (1770–1831), Soren Kierkegaard (1813–1855), William James (1842–1910), Mircea Eliade (1907–1986), Rudolf Otto (1884–1939), Friedrich Schleiermacher (1768–1834), Gerardus van der Leeuw (1890–1950), Karl Jaspers (1883–1969), Paul Tillich (1886–1995), Erich Fromm (1900–1980), Abraham Maslow (1908–1970), Erik Erikson (1902–1994), Langdon Gilkey (1919–2004), and David Tracy (1939–). The inherent religiosity, these and other theorists refer to, is not a person's creedal beliefs or institutional commitments per se but refer to our existential drive toward transcendence, freedom, and meaning-making, no matter the differences of religious or a/religious backgrounds or convictions.

Various phenomenologists of religion have helped us view religion as more than collective, institutional practices and beliefs and, instead, helped focus us on the nature of religious experience itself and its impact on how we come to understand ourselves as human beings. Soren Kierkegaard, the father of existentialism, described human development, particularly the development toward deeper subjectivity, as an ethical, aesthetic, and religious progression in becoming a “knight of faith” (1843/1954). William James demonstrated that we use religious symbols, words, and practices for pragmatic reasons and that such religious artifacts and activities represented existentially significant aspect of human existence (James 1902/2007). Mircea Eliade (1907–1986) wrote of the centrality of hierophanies, or experiences of the sacred breaking into mundane existence (Eliade 1959). Eliade further disclosed how we mythologize the significance these experiences in our lives, which in turn become narratives that orient our own identities as human beings. The stories and myths describe our relationship to both sacred and profane orchestrations of our everydayness. Rudolf Otto (1917/1958) focused on the phenomenology of the “holy” as a numinous experience, that is, as terrifying, attractive, and wholly other to us, and how such encounters clarify who we are in relation to the numinous (Otto 1917/1958). Otto's emphasis on numinosity is taken from the Latin, *numen*, meaning “deity.” The deity, from this perspective, is not a thing or substantial entity, but a qualitative experience, albeit one of otherness. Nevertheless, if the numinous is a qualitative human experience and a most intense one, then it inescapably influences the development of human being.

Our relationship with the numinous is particular. Given the power and awe evoked in its presence, Friedrich Schleiermacher (1893/2007) described our relationship to the divine as that of “absolute dependence,” noting the predication of human identity on that which is more than itself (Schleiermacher 1893/2007). Gerardus van der Leeuw (1933/1986) described the numinous as one of “power,” which, for van der Leeuw, should be understood in experiential ways rather than in

objectified, political, or sociological ones. Much like Otto, van der Leeuw noted that the experiential encounter with the numinous is an encounter with that which is completely overwhelming (van der Leeuw 1933/1986). We come to understand ourselves better as we see ourselves in perspective when confronted with such power. Karl Jaspers (1883–1969), the existential psychiatrist, addressed this phenomenon as well (Jaspers 1919). He wrote that we inevitably experience what he called “shipwreck” in our lives when we stumble into what he called “boundary situations.” Boundary situations, namely, conflict, death, suffering, chance, and guilt, bring us into contact with “the encompassing,” thus moving us toward the need for each other and the desire for free and meaningful communication. Boundary or ultimate situations, for Jaspers, initiate our transition as human beings from mere *existence* as functional and biological creatures to what Jaspers considered existential, meaningful *Existenz*. Finally, a survey of central figures in the phenomenology of *homo religiosus* must include Paul Tillich (1886–1965). Tillich emphasized the inescapable nature of our intentionality as human beings toward what is of “ultimate concern” (Tillich 1952).

The ideas offered by these thinkers in this survey on the phenomenology of religion include several points to consider: the idea that the sacred is experiential, that consciousness presupposes and is dependent on otherness, that transcendence is related to our intentionality toward otherness-as-ultimate concern, and that ultimate concern as enactments of significance are ever present in our everydayness. These issues are present and show themselves throughout the life span. “Otherness” is the particular qualitative distinction in experiencing the sacred and one that does not reside “in” human consciousness as much as in the “betweenness” co-constructed from our openness to the other and its call for us to dialogue.

If we start with an analysis of our formation as human beings, we find that we come to consciousness about ourselves only in relationship to another, thus suggesting that our very formation relies on the mutual exchange with

otherness. Hegel’s (1770–1831) dialectical development of consciousness is one way to understand this process and challenges our conceptions of ourselves as self-contained (Hegel 1807/1979; O’Neill 1996; DuBose 2000). Independence presumes interdependence, so, consequentially, we are not sole creators of ourselves. We desire to complete ourselves through engaging with the other, who in turn desires to engage with us. The unceasing call and demands of alterity, or otherness, as Mark Taylor’s (1987) survey of continental thought reminds us, demonstrate the centrality of alterity and interdependency in identity formation, which nonetheless is not a formation of the human being as a static and self-contained thing, such as “person.” If we mean by “religiosity” that we are absolutely dependent on the other, as Schleiermacher proposed, and if it is a given that we develop as a result of this dialectic, then the human being is necessarily *homo religiosus*.

We are also desiring creatures, thus disclosing the transcendent nature of our existence. Erich Fromm (1900–1980) described how the “x” experience, or God experience, is a desire for ultimate values in human existence that requires a letting go of egoism (Fromm 1966). Letting go of egoism is often forced when the impact of significant experiences beyond our control jar lose our grip on life. Many thinkers have written on these kinds of “limit” or “boundary” experiences inherent in human existence (Jaspers 1919; Tracy 1996) and at times have called them experiences of the impossible (Bataille 1988; Blanchot 1992), the abject (Kristeva 1982), and unresolvable aporias (Derrida 1980) or as an unreachable other (Lacan 2007). For Jaspers, *homo religiosus* communicates within boundary situations by way of “ciphers,” or symbols of the encompassing, which signify what is experienced by us as beyond our ability to confine and reduce its nature. This “absent presence” is transcendence for Jaspers (Schlipp 1957). Although these thinkers would differ widely in their theological proclivities, they all highlight the centrality of how “that which is more than we are” shapes who we are as human beings.

Commentary

There are differences of opinion as to whether or not *homo religiosus* refers to a “peak experience” (Maslow 1970) and whether or not *homo religiosus* describes an exceptional person, such as those individuals who have reached rare and higher levels of faith (Fowler 1981) and moral development (Kohlberg 1981), or is a description of the very constitution of any human being. David Wulff (1997) has written about how Erik Erikson’s (1902–1994) project of comparing Luther and Gandhi was an exploration of *homo religiosus* and emphasized the resolution of life crises in development, starting with our basic trust in the world. For Erikson, basic trust is the cornerstone of *homo religiosus* (Wulff 1997; Erikson 1958). Also for Erikson *homines religiosi* are those individuals in history who have offered us a new set of images and ways of being that promise renewed lives. As Wulff reads Erikson, the journey of *homo religiosus*, which is indeed a lifelong journey, brings one to a sense of centeredness, wholeness, a settled presence, and a greater sense of self and other awareness and well-being. Nevertheless, reserving the title of *homo religiosus* for exceptional individuals such as Mahatma Gandhi or Jesus of Nazareth perpetuates exclusivism and rank-ordered hierarchy of spiritual elitism, thus mitigating against the incomparable uniqueness of transcendence in our lives. Moreover, an elitist position for *homo religiosus* inattends to how meaning-making, transcendence seeking, encounters with numinosity, and finding oneself in the intimacy of relational engagement, even though unique in how these experiences are taken up, are also existentialles in the ontology of human existence as a whole.

Another separatist assumption is found in the popular distinction between religion and spirituality, which is spurious if we heed the wisdom of seeing human nature as inherently religious. To be a human being is to be an enactor of significance in each moment of our lives. Living out significance, or what matters most to us, is the heart of being *homo religiosus* in the world. The original etymology and history of the role of the psychologist was as an “*iatros tes psyche*,” or “physician

of the soul.” The logical positivist agenda of only accepting what is observably real contributed to the dissection of the theologian from the psychologist. Yet, lived experience itself is invisible, immeasurable, and incomparable, as life is lived rather than isolated, extracted and objectified, as the French phenomenologist Michel Henry (1922–2002) has argued (Henry 2003). Hope, significance, emotions, creativity, and intuition are expressions of the soul that propel our everyday decisions and are nonetheless invisible. The objectification of *homo religiosus* leads to the death of *homo religiosus*, which leads us back to the wisdom of Kierkegaard as we close. Access to our natures as *homines religiosi* is found in the radically subjectivity and intersubjectivity of our lived experiences and in the enactments of significance accompanying them.

Homo Totus

Kathryn Madden
National Institute for the Psychotherapies,
New York, NY, USA

Homo totus: [Latin origin: the Son of Man, the *homo maximus*, the *vir unus*, *purusha*, etc.]

Analytical Psychology

Says Carl Jung (1971: para. 419), the *homo totus* is an archetype of the Self, the beginning and the end of psychic process, an exercise of Platonic anamnesis, a memory of wholeness, and an *apocatastasis* that restores an original wholeness that preexists the consciousness of the human ego.

Jung speaks of the *homo totus* in the context of the alchemical process, the chemistry of the Middle Ages, or the art of transmuting metals, which was primarily a psychological process expressed in projective form. Jung says that “The moral equivalent of the physical transmutation into gold is self-knowledge, which is a re-remembering of the *homo totus*” (1968: para. 372).

In Jungian psychology, the notion of individuation indicates the personal journey in which the unconscious is the universal mediator and the all-embracing One (Jung 1971: para. 419) out of which consciousness discovers itself. Consciousness then separates itself out of the unconscious and distinguishes a series of pairs of opposites which unfold in an endless multiplicity in human life. By relating to all the opposites in the process of individuation, we “arrive where we started, and know the place for the first

time” (Eliot 1963, p. 208). This place is the knowledge and experience of the Self, the goal of individuation. The Self, in archetypal psychology, is a psychic entity more intensely unified than the unconscious, possessed of and by a oneness equaled only in its own archetype, the *imago Dei*.

Christianity and Analytic Psychology

In the Christian tradition, the objective referent of this archetype is the *imago*, or image of God. The Christian formulation of this symbolic figure, or *homo totus*, the archetype of the Self, was Christ within whom all the opposites were reconciled and no longer divided; thus, death was conquered. If we bring Jungian psychology into dialog with the Christian perspective, we might say that we individuate toward the goal of living in this image.

Yet, the fact that Christianity produced what would psychologically be considered an archetype of the Self, or archetypal god-man, is not unique to Christianity nor original to this one tradition. Because the *homo totus* is an archetypal idea, it is by definition universal in occurrence.

The *homo totus* is capable of autochthonous revival, “an image arising from the depths of the ‘chthonic’ unconscious” (1968: para. 26), anywhere, at any time. In other words, wherever there is psyche, there are archetypes, and wherever there are archetypes, the archetype of wholeness, or the archetype of the Self, will be foremost in primacy, always at the center of the psyche as a self-regulating force within the individual personality.

Jung tells us, when this archetypal idea emerges, it is a reflection of the individual’s wholeness, i.e., of the Self which is present in the person as an unconscious image (1971: para. 230). Christianity succeeded and sustained itself for over 2000 years largely influenced by the archetype of the Self that constellated in the soul of those persons in the first century (and after), who responded to the Christian message. The result was that the concrete, human Rabbi Jesus was rapidly assimilated by the constellated

archetype. Christ realized the idea of the Self, representing the culmination of all psychic processes to that point in the history of human consciousness.

Christ did so in that he represented the symbolic ultimate in individuation in which many are entirely subordinated to the One, the One being God. As symbolic, the *imitatio Christi*, living in the image of Christ, was not meant to be a superficial imitation (Jung 1971: para. 522) but a self-realization. Such an exemplar reaches back before Christianity to the Empedocleans and Platonists who believed in a transmigratory supernatural self, the daimon of Empedocles. To realize this Self was to attain the philosopher’s goal in the highest degree and to ascend to the *eidos* of humanity, in the philosophical sense.

Christ, then, is an image of the psyche’s inherent oneness. Christ depicts the living image of unity-in-complexity and the very nature of the structure of the psyche itself in that psyche insists upon a system with a center that repeats itself archetypal in the unconscious realm of all humankind for all time to be discovered and related to on the journey into wholeness.

If we interpret the content of experience of the *homo totus* by a particular faith, we tend to identify with our subjective interpretation of the manifestation, Jung tells us. To do so would be to lay absolute claim on only one specific image of the godhead, and Jung believes instead that, at least psychologically speaking, we should interpret images of the godhead by comparing all traditional assumptions of faith without insisting upon one over the other. His emphasis is upon the unconscious that expresses itself in a multiplicity of images and symbols.

Absolute Knowledge

In Jung’s own confrontation with mystery, he was not slow to pronounce that there is such a thing as “absolute knowledge.” Absolute knowledge pertains to the existence of an a priori knowledge, a preexisting order, and an order before the ego comes to consciousness (Jung 1960: para. 947).

Absolute knowledge is knowledge as the formally directing fact that activates and directs the archetypal field of the Self “as a deeper regulating and ordering field” (1960: para. 947, pp. 47–49).

Author James Olney concurs that the Self reflects absolute knowledge as it contains the marriage of the opposites of consciousness and unconsciousness in a marriage, a *hieros gamos*, a unified One. In this Unity of Being, “because the microcosm is identical with the macrocosm, it attracts the latter and this brings about the *apocatastasis*, a restoration of . . . original wholeness” (Olney 1980, p. 323).

Absolute knowledge is Self-knowledge, knowledge of the Self, which is an anamnesis, a memory of wholeness represented by the *homo totus* as an archetypal idea “by definition universal in occurrence and capable of autochthonous revival anywhere at anytime” (Olney 1980, p. 323).

In essence, we are speaking of a dynamic inbreaking of the collective unconscious, the notion of spirit coming toward us, summoning us in conjunction with culture and the unfolding of human history. The *homo totus* is a repeated expression of unitary reality in the psyche and is emblematic of that which is unconscious and needs to be made conscious again and again in our intrapsychic and collective lives as a symbol of individuation.

Homosexuality

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Same-sex attraction, love, and relationships have existed from very early times, though the ways in which they have been understood have changed over time and across cultures. Scholarly debate continues between “essentialists” and “constructivists.” Essentialists see sexual orientation as a stable trait recognizable across history and culture. Being “gay” or having a gay sensibility is a persistent and universal potential among humans. Social constructivists hold that our modern categories of ‘gay,’ ‘straight’ or ‘bisexual’ have been more recently created. Human sexual orientation is a more fluid characteristic. In any event, out of similar but slightly differing interests common ground is shared by gay, lesbian, bisexual, and transgender (GLBT) people.

What is unquestionably true is that modern communities of self-identified lesbians and gay men, existing within most industrialized Western societies as open members of the social whole, are a relatively recent phenomenon. The political movement of gay liberation, which began in Europe in the late nineteenth century, has resulted in significant changes of both attitude and practice in those societies. Elsewhere, even now, the existence of homosexual communities is less common in many parts of the world, and it is still viewed as either criminal, sinful, or a type of mental illness.

Since history has been written mostly by men, it is not surprising that we know more about same-sex love among men than among women. In

sexual politics, what the dominant gender does is of greater consequence and thus has been more likely to be recorded and given attention. This means that the negative attitudes about homosexuality have been particularly focused on males, often ignoring altogether female homosexuality and women in general.

In terms of spirituality it must be recognized that there is no spiritual tradition that is uniformly accepting and favorable toward persons with same-sex attraction. While people with same sex attraction have likely existed through all human history, only recently have people taken on a label distinctive of sexual orientation and been visible as a community. Having said that, there is a range of opinions within each of the major world religions as to the status of persons with different sexual orientation. It is important to note that the formal views expressed in the scriptures or writings of prominent religious figures may be more negative than the actual practice within any given spiritual tradition. As theology is translated into pastoral care, there may be more willingness to accept the human condition in its variety.

The Western monotheisms, Judaism, Christianity, and Islam, have been the most explicitly rejecting. Modern gay Jews, Christians, and Muslims face a long history of scriptural condemnation and outright persecution. The Eastern religions, Hinduism, Buddhism, Taoism, and Confucianism, have generally been less rejecting, though neither have they been positive nor affirming. Throughout most of human history, the family, comprised of mother, father, and children, has been the social focus of spiritual teachings. Thus, alternate forms of sexual expression or emotional and social attachment have received considerably less attention. Strong condemnation of many forms of sexual expression, heterosexual or homosexual, which do not support biological reproduction has characterized the official pronouncements by religious leaders across all major types. As long as individuals did their part in producing offspring, there was often little concern with any additional emotional or physical involvements. Bullough's (1976) work, despite its age, remains the most comprehensive history

of sexual variance across time and culture and chronicles the varying approaches of different religious traditions.

It is widely believed that the most favorably disposed culture toward homosexuality was found in classical Greece. However, the form that it took in that society is quite different than the forms in the current world. Men who sought out relationships with other men to the exclusion of marriage were shunned: viewed as odd and unfortunate. However, society was relatively tolerant of an adult male (termed an "erastes") having a social and sexual relationship with an adolescent (termed an "eromenos") up to the time when they began growing a beard (approximately 16–18). The older man was responsible for the moral education of the boy and often presented him with his first spear, shield, and armor as he joined the ranks of adult male citizens of the polis. There was sometimes a mock abduction and the pair would go off to the mountains for a period where sexual activity, male bonding, and education in the ways of adulthood took place. This sort of initiatory sexual relationship had broad social tolerance. Femininity was ridiculed as was excessive lust. In light of contemporary attitudes about the sexual abuse of adolescents and children, this model is no longer found acceptable.

Another model for same-sex desire and relationships involves gender transformation. Many cultures had rigid definitions of male/female characteristics but allowed those who did not fit the mold to switch roles and live as the opposite sex. Several native American tribes allowed this in one form or another. The older term "berdache" has more pejorative connotations and is now replaced by the term "two-spirit" people, to emphasize the presence of both masculine and feminine features in people we would view as lesbian, gay, or transgender.

The modern lesbian and gay culture continues to grapple with the mixed heritage from the world's spiritual traditions. There are gay-friendly advocacy and support groups in most Christian denominations (Fortunato 1982), within Judaism, Islam, and among Buddhists (Leyland 2000) and

Hindus. Many GLBT individuals wish to remain in the traditions that reject them to one degree or another, and among gay Christians, a thriving market exists for books with more favorable scriptural exegesis. But a gay spirituality movement seeks to trace out the more same-sex-friendly aspects of the world's religious traditions and craft a synthesis. Animistic and pagan perspectives from a variety of traditions, not just classical Greece, are often woven together (Conner 1993; Johnson 2000).

From a psychological standpoint, the treatment of GLBT persons by established religion leaves deep wounds and feelings of alienation. It is a sore spot in terms of both individual counseling and psychotherapy as well as in the larger arena of group to group relations. So called "reparative therapies" seeking to change sexual orientation are now widely considered inappropriate except by their conservative religious proponents. Gay affirmative therapies seek to repair damage done by both religious and secular discrimination and rejection. The movement for a gay affirming spirituality is underway. Yet the movement toward a gay-affirmative spirituality is well under way.

Hope

Gilbert Todd Vance

Department of Psychology, Virginia

Commonwealth University, Roanoke, VA, USA

Hope is an expectation of positive outcomes for future events. Hope is more than a mere wish as hope implies a belief and confidence that positive outcomes will be attained.

Hope is usually viewed as a positive attribute; however, the ancient Greeks were an exception to this view. In the myth of Pandora's Box, when the box was opened, all the evils of the world flew out to torment mankind. Hope, however, remained in the box. The Greeks were ambivalent as to whether hope was a blessing and consolation to mankind or a curse. Some modern writers have also voiced the view that hope is an evil. For example, Nietzsche stated that hope is the greatest of evils, because it prolongs mankind's suffering.

Hope is a prevalent and positive theme in the Judeo-Christian tradition. In the Old Testament, hope is placed in God or directed toward God (Psalm 42:5), rather than toward other, less sure means of deliverance (Psalm 33:17; Isaiah 40:31). Those who place their hope in God will not be disappointed (Isaiah 49:23). Hope is also associated with a future provided by God (Jeremiah 29:11).

In the New Testament, hope is one of three enduring theological virtues, along with faith and charity (love), described by the Apostle Paul in 1 Corinthians 13. Hope is an attribute of love (1 Corinthians 13:7). In the New Testament, there is a specific object of hope – hope in the resurrection of Jesus Christ, through which believers themselves are redeemed (Romans 8:24; 1 Corinthians 15:19; 1 Peter 1:3). Hope in the resurrection steadies believers during times of suffering. This hope is described as a "living" hope, one that is not frail or perishable (1 Peter). Functionally, hope serves as an "anchor" for believers (Hebrews 6:19). Hope is confidence that God's plans will be realized (Romans 5:2).

Psychologically, hope has been conceptualized as a goal-directed cognitive process consisting of

pathways to achieve goals and the perceived ability to use those pathways. Using this operational definition, C. R. Snyder and colleagues have conducted extensive research on hope. In this program of research, hope is positively related to positive outcomes in academics, athletics, health, and psychotherapy.

Clinically, one function of psychotherapy is to instill hope for change or healing. Karl Menninger called hope a “basic but elusive ingredient” in his comments to the American Psychiatric Association’s 1959 annual meeting. Hope also falls broadly under the category of positive psychology, which focuses on strengths and resilience.

Hormic Psychology

Paul Larson
The Chicago School of Professional Psychology,
Chicago, IL, USA

William McDougall (1871–1938) was one of the giants of early psychology, yet his legacy has gone largely unheralded, and his name is seldom recalled outside students of the history of psychology. His brand of psychology, termed “hormic” psychology, serves as one of the foundational frameworks for understanding the wide range of human motivational forces. The term “hormic” comes from the Greek word for impulse and

according to Hilgard (1987) was drawn from the work of T. P. Nunn, a British colleague.

McDougall was born and raised in Britain and studied biology at the University of Lancaster and later medicine at Cambridge. He completed his medical training at St. Thomas’ Hospital in London, with some additional physiological research under Sherrington. He went on to study experimental psychology under G. E. Müller at Göttingen.

His current lack of popularity in part stems from his taking up the cause of Lamarckian evolutionary theory, the notion that acquired traits can be inherited. He also supported the eugenics movement which was popular in the early twentieth century but became tainted by its association with forced sterilization of the retarded, as well as its use by Nazi lawmakers as a rationale for their race laws. He also defended the concept of instinct at a time when behaviorism was rising to ascendancy and instinct declining.

One of his less well-recognized contributions that are with us today is his advocacy of “three fundamental faculties, of knowing, of striving, and of feeling” (McDougall 1923, p. 378, as cited by Hilgard 1987, p. 813). This is now taught as the ABC of psychology, affect, behavior, and cognition, though behavior is substituted for the faculty of conation, or will.

His views on religion were unconventional. In his 1911 book, *Body and Mind* he espouses an animistic world view. Like Gustav Fechner before him, he finds that life and mind are characteristic of all entities in the natural world. His view are more consistent with the notion of modern panpsychism rather than the spiritual views of animists.

Hospice

Kenneth J. Doka

The College of New Rochelle, New Rochelle, NY,
USA

“Hospice” refers to a system of palliative – that is, comfort-oriented – care designed for patients in a terminal phase of illness. *Hospice* should be understood as a philosophy of care rather than a place where care is offered. It is important to recognize that such care can be offered in a wide range of settings including free-standing hospices, hospital-based hospice programs, individual homes, nursing homes, and even prisons.

The History of the Hospice Movement

St. Christopher’s Hospice and the Beginning of the Modern Hospice Movement

Dame Cicely Saunders founded the first modern hospice movement in 1967 in Sydenham, a south-east section of London. Saunders herself was a deeply spiritual woman, heavily influenced by Evangelical Christianity. The name she chose – St. Christopher’s Hospice – had deep religious roots.

The first hospices were established by religious orders, such as the Knights Hospitallers to care for pilgrims, including the sick and incurable, as they journeyed to the Holy Land. The Knights took great pride in offering not only spiritual care but also the finest food and dignified treatment to dying and sick nobility, even as the Knights dined plainly and lived simply (Connor 2009). Later, the term was used by the Irish Sisters of Charity, a religious order that saw its mission as caring for the dying poor. In fact, Saunders worked with them for a while developing her own philosophy of hospice care. St. Christopher, of course, was the patron saint of travelers.

Saunders was a remarkable woman. She began her career as a nurse and then became a social worker, before finally training as a physician. She sought to develop a facility that would not only

offer excellent care to dying cancer patients but would also be a research and training center. St. Christopher’s became the culmination of her vision.

The Development of Hospice in the United States

Saunders’ development of hospice was both part of and an impetus to a growing interest in thanatology – the study of death and dying. In that period, there was an emerging academic interest in death evidenced in the publication of Kübler-Ross’ epochal *On Death and Dying* (1969), the beginnings of thanatology journals such as *Omega: The Journal of Death and Dying*, and the development of professional organizations such as *Ars Moriendi*, the Forum for Death Education and Counseling, and the International Work Group on Death, Dying, and Bereavement (Doka 2007). The result of this was that the vision of Saunders and the work being done at St. Christopher’s generated intense interest.

Among those interested were Florence Wald, the Dean of Nursing at Yale, and Dr. Sylvia Lack, a physician who had trained at St. Christopher’s. They founded the first hospice in the USA in Branford, a suburb of New Haven. While this hospice first offered community-based, home-based care, later it shifted to the model of St. Christopher, centering care in a free-standing hospice. By the mid-1970s, a hospice movement was beginning in the United States. In these early years, this interest was generated by a wide range of organizations including churches and synagogues, junior leagues, women’s groups, and other community organizations.

Two factors facilitated the growth of hospice. The first was the development of a model of hospice care as exclusively home care. Dr. William Lamers, a California physician, also trained at St. Christopher’s. However, though Lamers left enamored of the concept of home care for the dying modeled there, he also had two other thoughts. The first was simply that he did not want to spend the next few years of his life raising money for a facility. Second, he believed that the best homelike atmosphere – a theme of St. Christopher’s – was to provide care in the

patient's own home. Lamers' model of hospice as home care could be readily duplicated by the many groups interested in beginning hospices.

While home remains the predominant mode for the delivery of hospice services in the United States and the emergence of such a model was a great impetus to the growth of hospice, hospices have also centered in other residences. Some hospices have created free-standing hospices much like St. Christopher's. In other cases, hospice services have been offered in nursing homes, dedicated sections of hospitals, and assisted living facilities. Some prisons have even included hospice services within prison infirmaries and hospitals. Hospice is less a place than a philosophy of care that can be offered in a range of settings.

The second major factor was that in 1982, United States Medicare allowed reimbursement for hospice services. This allowed a stable funding mechanism for hospice. Now there are over 4700 hospices in the USA – almost evenly divided between nonprofit and proprietary programs (Connor 2009). Hospice clearly has been one of the most successful social movements in the last quarter of the twentieth century. In addition, it has become more professionalized. The National Hospice Organization (NHO), now the National Hospice and Palliative Care Organization (NHPCO), began in 1978 as a trade/professional organization representing hospices and later palliative care programs. Other organizations such as the Hospice Foundation of America offer educational programs and resources. There are even specialized journals such as the *Journal of Hospice and Palliative Care*.

The Development of Palliative Care

The development of hospice, in general, and St. Christopher's, in particular, strongly influenced the development of palliative care. A Canadian physician Balfour Mount also visited St. Christopher's and decided to apply the principles learned there to dying within the hospital. Mount's work in this area at the Royal Victoria Hospital in Montreal is generally considered to be the beginning of the mainstream palliative care movement (Mount 1997). This movement has made considerable progress in its attempts to

incorporate the concepts of palliative care within the mainstream health system. Many hospitals now have palliative care programs, and in 2007, the American Board of Medical Specialties recognized palliative care as a specialty (Connor 2009).

Hospice Development Throughout the World

The concept of hospice has spread throughout the world. There are now hospice programs in Africa, Asia, Europe, the Middle East, as well as North and South America. In reviewing the worldwide growth of hospice, Kastenbaum and Wilson (1997) conclude that the hospices can be developed in a wide of range of cultures and the concept of hospice and palliative care transcends the phase of economic development, any given religious tenets, or any one spiritual base. They also note that hospices can draw from historic cultural strengths such as the emphasis on family.

Yet throughout the world, hospices have encountered and, in most cases, overcome resistance from varied quarters. In some cases, this may be a taboo about dying. In other cases, it may be unwarranted fears about the use of opioids leading to either addiction or hastening death. Finally, hospices may have to struggle to develop both sources for sustainable financial support and to find a place within existing structures of health care.

Philosophy of Hospice Care

Wherever hospices are and in whatever form they are offered, hospices do share a common philosophy of palliative care. Central to this philosophy are the following components.

Pain Management and Symptom Control

Key to the philosophy of hospice has been the notion that the heart of palliative care is effective pain management and symptom control. In terminally patients, there may be multiple sources of pain. Thus, hospices will try to carefully assess a patient's pain and apply a variety of strategies – including pharmaceutical approaches, radiation, surgery, alternative therapies, and psychological support – to alleviate pain. Hospices have developed common principles in treating chronic pain.

First is that the patient is the best judge of his or her own pain. Second is that pain medication should be given around the clock as needed. This avoids the pain cycle where patients become anxious that the pain medication will cease to be effective before the next dose is scheduled. Finally, pain medication needs to be titrated to allow the best balance between effective management of pain and unwanted side effects or sedation. In addition to pain management, hospices also seek to control, as much as possible, unwanted symptoms such as nausea, diarrhea or constipation, loss of appetite, confusion, or dyspnea (breathlessness).

However, hospices recognize that while managing physical pain is essential, there are other forms of pain as well that add to patient's sense of suffering. Patients may experience psychological pain such as anxiety. They may grieve the many secondary losses such as the loss of mobility and independence that are inherent in late-stage illness. They may be fearful for their family's survival. They may encounter existential pain as they consider their life or death. There may be spiritual pain as dying patients struggle with religious or philosophical themes such as forgiveness, uncertainty of the afterlife, or fears of judgment. A central tenet of hospice is that all forms of pain need be assessed and treated.

A Holistic and Team-Centered Approach

Since pain is so multifaceted, care must be holistic. Hospice programs emphasize that dying is not only a physical crisis but a social, familial, and spiritual crisis as well. This necessitates a team approach that includes not only physicians and nurses but also social workers, pharmacists, chaplains, volunteers, and varied therapists such as art and music therapists, physical and occupational therapists, or massage therapists.

Family-Centered Care

The other aspect of hospice care was to see not only the patient but the patient's intimate network as the focal point of care as both among those who are to receive and to give care. Since the family,

interpreted broadly, was the focus of care, services to the family continued after the patient's death. Bereavement care for the survivors became an essential component of hospice care.

Future Challenges

While the hospice movement has experienced dramatic growth since inception, in the United States, it faces continuing challenges. It is beyond the scope of this piece to consider all the challenges that hospices will encounter – especially as hospices emerge in varied cultures throughout the world. However, a few challenges do seem primary.

One of the major challenges that hospices face is that it is often late in treatment when patients and physicians can accept that fact that the goal of treatment is now palliative rather than curative. The result is that whole populations – such as children – may be underserved by hospice and that often referrals can be so late in the illness that the benefits afforded by hospice care are unrealized. Many hospices have responded by offering “bridge programs,” that is, programs where patients continue curative or life-extending therapies even while receiving palliative care through the hospice team. This may ease the transition to hospice care as the patient continues to decline. In many ways, this may require continued integration of hospice within health care systems.

Hospices were originally developed to treat cancer patients. In recent years, hospices have begun to treat a variety of other illnesses including advanced forms of dementia, AIDS, and other diseases such as ALS. In such cases, as well as in cancer treatment, it may be difficult to offer a prognosis that death is likely within 6 months (a precondition of the Medicare Benefit) even though care can no longer be curative.

Finally, hospice home care often requires a primary caregiver. If hospices are going to effectively serve clients living alone, they may need to develop increased flexibility in the services that they offer. All of these challenges may require modifications in the regulations such as Medicare that govern funding.

In summary, the development of hospice has led to the continued development and improvements in the nature of palliative care. It has highlighted the importance of offering bereavement services to families and communities. By creating the option of holistic, family-focused, humanistic care, hospices have markedly changed the ways individuals die.

Humanistic Pastoral Counseling

Dominick D. Hankle

Regent University College of Arts and Science
Undergraduate Psychology, Virginia Beach, VA,
USA

Introduction

To fully appreciate what is meant by humanistic pastoral counseling, it is important to spend time understanding what humanistic psychology/counseling is and what differentiates a pastoral counselor from a traditional counselor. Humanistic pastoral counseling is a way of providing pastoral care from a humanistic perspective. Because humanistic pastoral counseling is developed from the convergence of humanistic psychological theory applied in the pastoral counseling setting, humanistic pastoral counseling is best understood through an exploration of these key ideas.

Three Forces of Psychology

Psychology is often understood as consisting of three historical movements or as Ernest Hilgard calls them three forces. The first force is the psychodynamic force dominated by the work of Sigmund Freud and his successors. This approach primarily focuses on the power of unconscious experience and its impact on people's lives. The psychoanalytical approach proposes people are driven by unconscious drives that become unbalanced or distorted through repressed anxious energy. To discover what one is repressing, an individual works with a trained psychoanalytical therapist to become aware of these distorted and repressed drives. Once discovered, the client experiences catharsis which frees them from their anxious energy, thus facilitating healing (Freud 1936, 1953). This first force in psychology

was strongly associated with clinical work and dominated the therapeutic application of psychology for many years.

The second force of psychology consists of the behaviorists and the neo-behaviorist approaches for understanding human behavior. Frustrated with the inability to properly explore human experience through scientific inquiry, psychologists like John B. Watson and B. F. Skinner believed the mind was like a black box unavailable to scientific exploration. In fact, many behaviorists argued there is no such thing as the mind. What can be studied are the antecedent events an organism experiences and the behavioral outcomes that emerge from those experiences. Behaviorism focused on adjusting environmental conditions in order to predict and shape behavioral results (Watson 1919). Rewards and punishments determined the manner in which an organism behaved, and so all human and animal behavior could be reduced to these factors. In fact, those adhering to the school of behaviorism believed all it took to understand or shape an organism's behavior was understanding what rewards and punishments the environment needed to provide.

The third school of psychology was birthed from the sense that human beings are more than determined creatures motivated by unconscious drives or environmental determinants. There seemed to be something unsatisfactory about the determinism and inaccessibility of the psychodynamic approach as well as the overly mechanistic view behaviorists had of people. Because of that, a number of psychologists wanted to recapture a more holistic and human understanding of behavior. Theorists like Abraham Maslow (1968, 1970) proposed people are driven by a set of hierarchical needs that include everything from the base biological requirements of safety, hunger, sex, etc. to the more transcendent needs of love, competence, and self-actualization. Carl Rogers contributed to the humanistic psychological movement in his therapeutic theory called person-centered therapy. Rogers (1951, 1961) emphasized self-actualization in a similar way as Maslow but added that human beings reach this

level of functioning by making one's ideal self congruent with one's actual self. Rogers believed people are incongruent because they experience conditional love, a love experienced for being someone other than who they believed themselves to be. They experienced conditional love because they were living up to the image society, parents, etc. expected of them not who they believed or desired themselves to be. Rogers believed congruence comes when one experiences unconditional positive regard. This is a type of love given to someone without condition. Through unconditional positive regard people can self-actualize, meaning, they can be the person they believe themselves to be without external pressure. Unconditional positive regard loves a person for who they are thus allowing the ideal self and the actual self to be congruent. Other contributors to this school of psychology include existentialists, gestalt therapists, and numerous other psychologists that view people as more than determined creatures. In the humanistic school of psychology, people are capable of exercising free will to become whatever they want. The humanistic school of psychology is best described by Hergenhahn and Henley (2009) in the following way:

Third-force psychology contrasts vividly with other approaches because it is not deterministic in explaining human behavior. Rather it assumes that humans are free to choose their own type of existence. Instead of attributing the causes of behavior to stimuli, drive states, genetics, or early experience, third-force psychologists claim that the most important cause of behavior is subjective reality. (p. 534)

Humanistic Psychology as a Bridge for Pastoral Care

These features of humanistic psychology as well as its application to therapy opened a previously closed door for pastors and other religiously minded people to accept psychological ideas as part of their approach to providing pastoral care. Previous movements like psychoanalysis and behaviorism found themselves in opposition to

religion. Historically, religion and psychology initially interacted without much issue, but later schools of psychology such as the psychodynamic school placed themselves in opposition to religion. Most religiously minded individuals found no difficulty embracing the work of early experimental psychologists like Wilhelm Wundt. Wundt, in 1879, established what many believe was the first experimental psychology lab. Early experimental psychology never really denied the importance of metaphysical ideas, and Wundt believed questions about the nature and meaning of life are not decisively answered by psychology but rather that psychology should follow the same path as the natural sciences (Entwistle 2015). Religious individuals could accept that psychology explored another facet of God's creation without displacing the role they had as ministers. Experimental psychology was not threatening the worldview of religious people. The same could not be said of the psychodynamic approach of Freud. The psychoanalytical movements as well as a number of other later psychological movements were less indifferent to religious ideas. Freud believed religion was a cause of psychological problems rather than a positive factor in one's well-being. His 1927 book *The Future of an Illusion* had a profound effect on the way psychologists viewed religion and described religion as a sign of immense neurosis Freud hoped one day people would overcome (Paloutzian 2017). The belief that religion was a sign of psychological weakness became prevalent in the psychological world. Combine this with the fact psychological therapy appeared to be encroaching on the role of the Christian minister further divided religion and psychology. Christian ministers could not embrace overly deterministic, mechanistic, and reductionist views of people and so it was not until the humanistic approach to psychology recaptured a more holistic self-driven human nature did there seem to be a more positive move toward the merging of humanistic counseling and pastoral ministry. While there were still differences and many key figures such as Maslow had a negative view of religion, the

ideas from the humanistic approach to psychology could be adopted by those maintaining a religious world view.

The Pastoral Counselor

It would be wrong to assume that a pastoral counselor is no different than a secular or other religious counselor (i.e., a Christian counselor, for example). Certainly, it is possible for a Christian counselor to be a pastoral counselor but one who does pastoral counseling can be from another religious tradition such as Judaism or Islam. Pastoral counseling's distinctiveness is articulated well by Patton (2005/1990) in his definition articulated in the *Dictionary of Pastoral Counseling*. He writes:

Pastoral counselors are representatives of the central image of life and its meaning affirmed by their religious communities. Thus, pastoral counseling offers a relationship to that understanding of life and faith through the person of the pastoral counselor. This emphasis upon a relationship to the religious community distinguishes pastoral counseling both from religious counseling in general and from certain types of secular psychotherapy. Whereas religious counseling and some secular therapies commonly teach particular practices and/or systems of belief, pastoral counseling is identified by its representation of the community that authorizes it, through a relationship to a pastor accountable to that community. (p. 850)

The point of difference between a pastoral counselor and other forms of counseling is that pastoral counselors are held accountable to the religious communities in which they work. They bring into the therapeutic relationship not just an individual, nor an individual and the divine presence, but rather an individual who integrates the divine into the therapeutic situation within the context of a religious community. This accountability to a religious community and the dynamic it brings into the pastoral counseling setting means that when the pastoral counselor uses psychological theory, he or she must do so in such a way it does not conflict with the beliefs and practices of the religious community they represent. Pastoral counselors who utilize the

humanistic school of psychology must first be accountable to the religious tradition they embody and then find ways to integrate humanistic psychological ideas into the counseling setting.

In the end, this means humanistic pastoral counseling understands particular concepts from the basis of their religious tradition. Self-actualization must be understood as a state of being consistent with one's religious community's beliefs about the end of human life. The Rogerian idea of an ideal self must be an ideal self-embodying the religious community's belief of similar constructs. If the pastoral counselor makes the particular humanistic school of psychology's ideas primary, they are not performing pastoral counseling because they are not adhering first and foremost to the community which they represent. Therefore, while one can do pastoral counseling through the techniques and ideas of the humanistic school of psychology, they can never forget their first commitment is to be a representative of the religious communities and the ideas these communities profess above all else.

In the end, there is a great deal pastoral ministers can utilize from this psychological perspective. The idea of a free will and the ability to choose, the fact there is human autonomy to be whatever one chooses, the existential assumptions, and the fact therapy is an active activity in which the therapist walks "with" the client toward a common end are complimentary with most forms of pastoral care. Therefore, a proper approach to humanistic pastoral counseling is one in which the therapist utilizes the complimentary humanistic psychological assumptions and techniques to assist those placed under their pastoral care within the framework and context of the religious community they represent.

Humility

Everett L. Worthington Jr.

Department of Psychology, Virginia

Commonwealth University, Richmond, VA, USA

Every major religion endorses humility as a virtue, though this usually involves humility in the face of the sacred. Less attention has been given within religions to interpersonal manifestations of humility. The religious perspectives have brought forth numerous practical and theoretical understandings of spiritual humility for centuries (for a

review, see Porter et al. 2017). In the last 15 years, the field of psychology has pursued the scientific study of humility (Worthington et al. 2017), and that study has begun to differentiate various types of interpersonal and general humility.

Basic Definitions

The scientific study of humility began in earnest only around 2000 (Tangney 2000), and almost 200 empirical studies have been conducted since then. Originally, the field was paralyzed by the paradox that self-reporting high humility might be true or an act of self-delusion or narcissism, which led to validity suspicions regarding self-report instruments. But Davis et al. (2011) noted that using other reports and behavioral indications of humility seemed to provide construct validity for scores on self-report instruments, and assessment of humility has flourished (Hill et al. 2017). Davis et al. (2011) also noted conceptual lack of consensus, but suggested a multipart definition. Worthington and Allison (2018) have refined the definition to include three parts: (1) accurate self-assessment with awareness of one's limitations and a sense of being teachable in overcoming the limitations; (2) modest self-presentation; and (3) an other-orientation that seeks to lift others rather than pull others down. All three elements together were considered necessary and sufficient to indicate humility, and they were especially apropos when the ego was under strain.

Several reviews have summarized humility and religion or spirituality (Bollinger and Hill 2012; Davis et al. 2017a; Leach and Ajibade 2017; Porter et al. 2017; Worthington and Allison 2018; Worthington et al. 2017). Most religious writing promotes humility in the face of the sacred, which is called spiritual humility (Davis et al. 2010). Other types of humility describe people's general character (i.e., general or trait humility), which is often the focus of philosophers. Still others examine the uniqueness of the display of humility in different relationships (called relational humility, Davis et al. 2011, 2017b), the display of humility when encountering ego-challenging differences in ideas (i.e.,

intellectual humility) especially in important value-laden areas (i.e., political humility in exchange of political ideas; religious humility in exchange of religious ideas). Acts of humility (i.e., acts indicating a state of humility) are differentiated from the more general forms of humility (see Worthington and Allison 2018).

Religion is taken as a set of beliefs, values, and practices generally agreed upon by a community of believers or practitioners of faith and spirituality is closeness or connection with the sacred. Davis et al. (2015) have identified five objects people often treat as sacred – God or religious objects or practices (religious spirituality), humans (humanistic spirituality), environment or nature (nature spirituality), the transcendent (transcendent spirituality), and the self (self-spirituality).

Spiritual Humility

Many studies have related degree of faith commitment to spiritual or general humility. This has yielded a number of investigations finding higher spiritual humility related to higher commitment to religion, higher spirituality, and higher spiritual stability (Worthington and Allison 2018). Worthington and Allison reviewed research showing that spiritually humble people are usually more personally, intellectually, relationally, and culturally humble. More spiritually humble people also had more self-regulation, more overt religious practices, better self-ratings of morality, more intellectual humility regarding religion, and less reaction to an author who disagrees on religion. When counselors were more humble spiritually, they had better counseling outcomes for the clients of psychotherapists. To the extent that a person is spiritually humble, other effects that accrue to spirituality and religion (like longer life, better health, etc.) will accrue to the spiritually humble person. Thus, spiritual humility has been found to be related to better mental health, better social and psychological well-being, more prosociality, higher levels of reciprocal altruism, and lower hedonism. Spiritual humility, being humble before whatever one considers sacred,

seems broadly related to a multitude of prosocial outcomes. This is bedeviled by the same confounds that make interpreting any religious finding difficult. People who are religious (in this research, usually those who are spiritually humble) do many prosocial and healthful behaviors as a result of their adherence to religion. They belong to a community and thus experience social support. They do not do health-compromising behaviors as frequently as the nonreligious. That is, they do not as often drink, smoke, or do drugs and thus do not put themselves at risk as often in bars and neighborhoods where drugs are sold. They do not hang with gangs, rob banks, engage in gunfights, participate in riots, etc., as often as those not affiliated with religion. Thus, people who are spiritually humble (and thus often more religious) are likely to experience many benefits, and it is difficult to sort out what might be due to spiritual humility and what might be due to the concomitants of religion.

Religions and Humility

The various religions treat humility differently. These cultural differences affect how humility is understood and practiced.

In Judaism, spiritual humility is the focus. Moses, the founder of Judaism, is considered an exemplar of humility. However, Maimonides codified virtue ethics into Jewish law. Most moral truths are aimed at an Aristotle-influenced Golden Mean between two extremes. Maimonides teaches that humility is not utter self-denigration or considering oneself worthless. Low self-esteem is considered to be at the root of arrogance. Judaism demands humility-flavored spiritual growth from its adherents.

In Christianity, humility is at the basis of the faith. Jesus is described as relinquishing equality with God as a right and taking the form of a servant, who served people even to the extent of dying for them so that they might be redeemed and have eternal fellowship with God. That was an example of humility, and it informed interpersonal humility – that Christians should be willing

to lay down their lives for others (not merely believers but strangers, out-group members, and even enemies).

In Islam, humility begins when people acknowledge that they are dependent on and submissive to God. Yet even believers who seek to be submissive to God might not be humble people. In Muslim tradition, humility helps people be more perceptive and understanding. God is unlikely to grant those who lack humility keen understanding. To develop humility, (1) eschew arrogance by acknowledging God's majesty in light of flawed humanity and then (2) do not allow external forces to despoil whatever humility one experiences. The path to humility is through emulating the Prophet, who is considered to be the primary example of humility.

In Hinduism, the Bhagavadgītā usually considered essential sacred writing within the Hinduism, extols humility. Humility is the first of virtues mentioned by the teacher, Krishna. The Bhagavadgītā also describes a learned person as rich in humility and a liberated person as without ego. Humility is not self-denigration, but arises from recognizing one's dependence on the universe. In Hindu tradition, people live as indebted to God, teachers, ancestors, nature, and other people. People grow in humility and decrease in arrogance by acknowledging that debt to others.

In Buddhism, Humility is seen as freedom from conceit, which is one of the highest of ten fetters that prevents beings from being freed from suffering. One can defeat conceit only by achieving the highest level of spiritual development, when craving disappears. Buddhist humility involves proper conduct towards people worthy of respect and honor and accurate knowledge of one's limitations. Buddhist humility involves giving up three conceits – "I am equal, better, or worse" than others. One relinquishes an illusion of a permanent self, which leads to conflict and conceit. To develop humility, the Buddha recommended meditation and seeking to develop the Noble Eightfold Path to give up all conceits.

Thus far, we have focused mostly on humility within the bounds of organized religions, briefly alluding to the largest religions. Spiritual humility

is almost always advocated as a virtue, but there might be a down side to it as well in its interaction with religious humility.

Religious and Spiritual Humilities – Some Paradoxes

Religions promote spiritual humility, as we have seen above, but they also promote commitment and adherence to the concepts and community of faith. This might suggest that high spiritual humility might promote low levels of religious humility, which involves accepting one's own accepted teachings and dealing in kindness and hospitality with people of one's own faith, but perhaps not being open to other faiths or beliefs. That is, we might find in many religious people high spiritual humility but low religious humility and perhaps low political and intellectual humility. Such findings are not rare. People accept, act altruistically toward, and forgive in-group members or their religion more than out-group members. However, perhaps one can overcome this paradox by engaging in Mouw's (2010) convicted civility. That is, he suggests that people can civilly discuss and even be open to modifying religious (and political or other intellectual) beliefs and values. Applying philosopher of science Imre Lakatos' ideas might suggest how this could be done. Lakatos (1978) showed that scientists often were committed to a program of research that was characterized by core concepts and other concepts of mid-level importance and even peripheral importance. Scientists usually were not willing to abandon core concepts but were able to let findings from studies modify their mid-level and peripheral concepts. This might also be used to move toward a resolution of the paradox between spiritual and religious humility. Core religious ideas might remain impermeable for the religiously and spiritually humble person, and other ideas could be seen as open to modification through discussion and data. For people who are low in religious humility, they might have a core that includes many ideas that might not necessarily be basic to the religion, but might be held onto as such. Inevitably religions

might differ on what is core. For example, fundamentalist religions might hold onto the sanctity of sacred texts more than more liberal religions, but more liberal religions might deemphasize loyalty, authority, or other values not associated with justice, freedom, and equality.

Promotion of Humility

Applied psychological science has shown that people who wish to can develop more humility. This is true of spiritual humility as well as humility practiced within a religious community (see Benedict's 12 steps up to humility [Bonomo 2003] and Bernard of Clairvaux's 1974 12 steps down to pride). Lavelock and her colleagues (2014) have developed a five-step method to PROVE Humility, which has been shown to be efficacious in both randomized controlled trials and field studies based on promoting the three elements of humility – accurate self-assessment, modesty, and orientation to build others up. In separate studies, the 7-h workbook intervention promoted substantial changes in trait humility, but it also promoted forgiveness, patience, and less trait negativity (Lavelock et al. *in press*). This suggests what philosopher-theologians like Augustine claimed: Humility might be a gateway virtue that promotes other virtues.

Humility is truly a concept that now can be claimed by both religions and psychology. Psychological science has provided more nuanced understandings of types of interpersonal humility than was available in the past, which primarily focused on spiritual humility.

Hypnosis

Eric K. Willmarth
College of Integrative Medicine and Health
Sciences, Saybrook University,
Oakland, CA, USA

Hypnosis is a word which generates instant reaction from those who hear it. Some associate the word with the entertainment of the stage hypnotist, while others think of something evil or dark. Still others may think of hypnosis as something wonderful but mysterious. Clark Hull (1933) acknowledged this problem when he wrote “All sciences alike have descended from magic and superstition, but none have been so slow as hypnosis in shaking off the evil association of its origin” (p. 18).

Clinical hypnosis has a well-established role in pain management, psychotherapy, and many other medical and psychological applications. Still, difficulties agreeing on a precise definition, multiple theoretical orientations, and a history of misuse have limited this treatment from reaching its full potential.

The debate about the good or evil of hypnosis has a long history and exists both within the scientific world and the religious world. Pentecostal pastor Dr. Lester Sumrall (1988), an outspoken critic of hypnosis, wrote “Hypnosis is a black art. It is bad, always bad, never good but absolutely bad, completely bad, wholly bad” (p. 26). In contrast, in his book *Hypnosis Healing and the Christian*, John Court (2002) carefully reviews the history, inaccurate stereotypes, biblical references, and current applications. He acknowledges that there are risks of misuse but concludes that “Of itself, it is neither good nor bad. It is a tragedy that so many Christians have been warned off hypnosis when it has such great potential to provide benefit to body, mind and spirit” (p. 149).

Defining Hypnosis

No one definition has been found that satisfies everyone working in the field of hypnosis. Often the terms “hypnosis,” “hypnotism,” and “hypnotic ability” are combined and confused. Hypnosis has been defined as a procedure, a process, an altered state of consciousness, and a genetic trait. Factors such as social context, demand characteristics, expectancy, and interpersonal relationship also enter into some definitions of hypnosis although often therapists revert to a description of hypnosis rather than a definition. The descriptions include factors such as increased suggestibility, narrowed focused attention, dissociation, and a trance state.

In his book *Religious Aspects of Hypnosis*, Bryan (1962) defines hypnosis as a normal physiological phenomenon and an altered state of consciousness. He goes on to suggest that hypnosis is produced by a central focus of attention and an inhibition of the surrounding

environment (dissociation). He adds that hypnosis produces an increased concentration of mind, increased relaxation of the body, and increased suggestibility.

Willmarth (2015) published a set of video interviews featuring 12 of the most respected authorities on hypnosis, each responding to a request to offer their own definition or understanding of hypnosis. Representing a social cognitive perspective in his interview, Dr. Guy Montgomery suggests that hypnosis is an agreement between someone designated as a therapist and someone designated as a patient, to undergo a psychotherapeutic technique where the hypnotist makes suggestions to the patient for changes in cognition or affect (thoughts or feelings) for the patient’s benefit. This perspective does not require or promote the concept of an altered state of consciousness. In contrast, in his interview, Dr. Harold Crasilneck states emphatically that hypnosis is an altered state of consciousness and that hypnosis deals with the unconscious mind. Dr. Eva Banya sees hypnosis as an intensive interpersonal relationship that impacts both the patient and the therapist. Dr. Cory Hammond provides a balanced definition that acknowledges that hypnotic ability varies from one individual to another and that the social cognitive aspects of hypnosis such as context and expectancy probably are more important to those with lower hypnotic ability while less important to those with high hypnotic ability. There appears to be little disagreement that hypnotic ability varies widely among individuals, a talent similar to musical ability or artistic ability that follows a normal curve in population distribution. There is less agreement about whether someone’s hypnotic ability can be improved with training or practice.

The American Psychological Association’s Division of Psychological Hypnosis (Division 30) has made several attempts to collaborate on a definition of hypnosis. The most recent effort defines hypnosis as: “A state of consciousness involving focused attention and reduced peripheral awareness characterized by an enhanced capacity for response to suggestion” (Elkins et al. 2015). This definition leaves room for multiple theoretical perspectives and, by referring

to “a state of consciousness,” leaves the door open regarding whether this is an altered state, a normal state, or a state similar to one reached by prayer, meditation, or other practice.

Hypnosis and Religion

From the beginning, hypnosis and religion have been entwined. Franz Antoine Mesmer is given credit for founding hypnosis with his introduction of animal magnetism. He learned his original techniques with magnets however from the Jesuit priest, Father Maximillian Hell. Mesmer gave up the use of magnets in favor of a belief in Universal Magnetic Fluid, which he believed was a flow of energy, like electricity, that he himself controlled in abundance. Mesmer’s rise to fame included discrediting another Catholic Priest, Father Johann Gassner. Gassner was curing people with the use of exorcism, using techniques similar to the treatment practiced by Mesmer. Mesmer’s ability to show comparable results using the “science” of animal magnetism was a part of the Enlightenment’s transition from a belief in religion to a belief in science (Hughes and Rothovius 1996).

Dr. Margaretta Bowers (1959) suggested that “Whether he approves or disapproves, every effective religionist, in the usages of ritual, preaching, and worship, unavoidably makes use of hypnotic techniques, and is therefore subject to the same responsibilities as known and acknowledged by the scientifically trained hypnotist” (p. 205). In his book *The Pastoral Use of Hypnotic Techniques*, Joseph Wittkofski (1961) outlines specific applications for the use of hypnosis in the pastoral setting while acknowledging that a strong background in psychology is a prerequisite for such counseling. Rabbi Bertram Korn (1965) contents that he has no objection to the use of hypnosis but warns that religionists need to be careful of their roles. “I am eager to learn about hypnosis and its uses and insights; but I personally do not believe that I as a clergyman have any more right to usurp the proper work of the trained psychotherapist than he has to assume my role as religious leader” (p. 31).

In a review of the available literature, very few organized religions specifically object to the use of hypnosis although all note the need for caution. While the Catholic Church has specifically endorsed the use of hypnosis, most other formal religious organizations stop short of formal endorsement but support its appropriate use. The Pentecostal Church and some Baptist groups are the most vocal in their opposition. Most acknowledge the hypnotic-like qualities of ritual, prayer, meditation, and suggestion offered within the context of religious practice. Some such as Dr. Peter Francuch in his book *Principles of Spiritual Hypnosis* (1982) actively promote the study of hypnosis to enhance to work toward religious goals. All seem to echo the sentiment that hypnosis is neither good nor evil but agree that it can be used for good or evil. The training and the motivation of the hypnotic practitioner is key to a positive experience.

Hysteria

Arsev Ayşen Arslanoğlu Yıldırım
Department of English Language and Literature,
Artvin Çoruh University, Artvin, Turkey

Hysteria, arguably the oldest neurosis in recorded medical history, dates back to an Egyptian medical papyrus written in about 1900 B.C. which noted that some curious behavioral changes were observed in women. The word itself derives from the Greek word “uterus” originating from the Sanskrit word for stomach or belly. The term reflects the ancient view on the nature and origin of the disease. The ancient Egyptians interpreted that the symptoms seen in women resulted from movement of the uterus “which they believed to be an autonomous, free-floating organism” (Micale 1995, p. 19). They thought that those bizarre symptoms occurred when the uterus moved upward and applied pressure on the diaphragm. The ancient Greeks shared the idea of a “wandering womb” adopting it as a migratory uterus, and established the connection between hysteria and an unsatisfactory sexual life. In the ancient period, figures such as Galen and Soranus suggested various views; however, it is appropriate to say that the idea of the “wandering womb” was the dominant view, and discussions were shaped according to agreeing or disagreeing with

this idea. In the following centuries, the disease has been “the nosological limbo of all unnamed female maladies” and has challenged the doctors’ powers of understanding and therapeutic skills. Besides, since it is hard to determine whether the disorder is real, fictitious, somatic, or psychopathological, hysteria is seen as uncanny and called “mysteria” from time to time (Scully 2009, p. 7). Outside the medical field, hysteric symptoms were mostly evaluated from the perspective of ecstasy in religion. Within this context, this entry will focus on the relationship between hysteria and religion by focusing on the major paradigm shifts in the history of hysteria.

The first great paradigm shift occurred with the coming of Christianity: The highly dramatic symptomology of hysteria such as convulsions and contortions was seen as the sign of possession by the devil, and the possessed female was seen as either a victim of bewitchment or the devil’s mate to be cursed. The demonological model considered hysterical symptoms as the marks of devil. Accordingly, the treatment methods changed and supernatural invocations became the dominant treatment forms. The demonization of the diagnosis changed people’s perception of the disease, resulting in the widespread persecution of the afflicted. Spirit possession and exorcism became increasingly effective in dealing with the hysterics. For most people in Europe, demonic possession was a rational diagnosis. The afflictions – the convulsions, contortions, muscular rigidity, swelling, vomiting alien substances, contempt for sacred objects, and speaking in languages unknown to the patient before – were considered as the result of the devil’s possessing the person. The signs of possession can be divided into two groups as physiological and behavioral. The first group included the alteration of anatomy or bodily functions, and the second one involved changes in speech, character, or moral conduct. The resemblance between the signs of possession and hysteria made it possible for physicians to evaluate possession within the category of hysteria (Levack 2013, p. 21).

Brian P. Levack (2013) points out that “demonic possession is a social construct based on a widely shared belief that a maleficent spiritual being can cause the abnormal or pathological

behaviour described above” (p. 16). In his study, *Ecstatic Religion: A Study of Shamanism and Spiritual Possession*, I. M. Lewis (1971) differentiates between peripheral possession and main morality possession (p. 29). Following the Christian tendency, he attempts to equate trance and possession and provide a cultural explanation of mental dissociation. The altered states of consciousness such as trance states are open to different cultural controls and various sociological explanations. In the example of Europe, no theory alternative to demonic possession had been produced by the seventeenth century since the physicians had felt no need to produce a theory at a period when everything was evaluated in terms of religious criteria. New Testament recounts a number of events where Christ and the Apostles expelled demons from the bodies of human beings. Levack (2013) mentions that the demoniacs cured by Christ did not manifest all of the symptoms of possession: “The only symptoms identified of five exorcism stories were temporary loss of speech, hearing, or sight; convulsions that in one involved foaming at the mouth and the grinding of teeth; demonstration of preternatural strength and anatomical rigidity; and violent self-abuse” (pp. 37–38). New Testament texts provided little information about the powers and identity of demons. Therefore, the organization of the demonic world, the functions of fallen angels, and the reason why they possessed were the issues Christian writers would speculate about in the following centuries. Despite the scarcity of information on such matters, the possibility of the devil’s invading and possessing a human body was never questioned.

Until the late Renaissance which witnessed the height of the understanding that related hysteria to witchcraft and the efforts to renaturalize hysteria, there had been no attempt at changing the theological perspective. On the other hand, the classical views emphasizing the relation between hysteria and the womb continued to exist although they are not expressed as widely as before. With the development of a neurological model of hysteria, the seventeenth century was marked as an era of intellectual innovation in the history of the disease. Seventeenth-century physicians began to conduct autopsies on hysterical patients, none of

which showed postmortem uterine pathology. Therefore, the idea that the origin of hysteria was neither womb nor the soul but the brain started to be expressed by such physicians as Charles Lepois. Sabine Arnould (2015) takes attention to the fact that the use of the term “hysteria” produced an epistemological shift as different symptoms were involved in its diagnostic criteria:

The use of the term produced an epistemological shift as different afflictions converged in the diagnosis “hysteria.” Between 1575 and 1820, perceptions of the pathology’s association with gender, with class, and with religion developed along different trajectories and through different forms of narrating, explaining and citation. (p. 14)

In the history of hysteria, the predominant category of the sixteenth and seventeenth centuries was “suffocation of womb,” which first appeared in Ambroise Paré’s *De La Generation* (On Generation) published in 1561 (Arnould 2015, p. 14). Hysteria was introduced into the medical discourse by Edward Jorden whose testifying was declined by the judge during the case of Mary Glover in 1602. Mary’s parents belonged to the Puritan congregation so they were familiar with the news of recent possession cases. Thinking that their daughter might be afflicted as well, they accused Elizabeth Jackson of causing Mary’s affliction. During the trial, the prominent doctor Edmund Jorden testified that Mary was not possessed by the devil but was suffering from hysteria known as “the suffocation of the mother.” Nevertheless, the judge, Sir Edmund Anderson, dismissed his argument and declared Elizabeth Jackson guilty. In response, Edward Jorden published *A Briefe Discourse Called the Suffocation of the Mother* where he claimed that some actions of the body which were attributed to the devil had natural causes, indeed. Publications on the disease began to increase at the beginning of the seventeenth century, and the tendency to gather similar symptoms under the diagnosis of hysteria without distinguishing these pathologies from each other occurred. At the end of the seventeenth century, *histerica passio*, *hysteric affection*, or *fits of the mother* were being used replaceably to refer to the term hysteria.

The two prominent names in the seventeenth century in terms of the history of hysteria were Thomas Willis and Thomas Sydenham. Thomas Willis, who was a professor of natural philosophy at Oxford, published *Pathologicae cerebri, et nervosi generis specimen* in 1667, which was translated into English in 1681 under the title *An Essay on the Pathology of the Brain and the Nervous Stock in which Convulsive Diseases are Treated of*. In his study, the symptoms experienced by men and women were found to be similar. Willis interpreted these data as the basis of his idea that such symptoms had their origin in the brain and the nervous system. Sydenham was the first who proclaimed that hysteria had not vanished because it imitated other diseases. He observed that hysterical symptoms appeared when there were tension and stress around the patient and proposed that “hysteria was itself somehow an imitation of civilization” (Gilman 2013, p. 102). He devoted his 1682 dissertation to “hysteric and hypochondriac affections, which he considered as indistinguishable as two eggs. Sydenham estimated the number of sufferers at more than half the population, noting that most women were afflicted, as were sedentary men” (Arnould 2015, p. 17). Sydenham demystified hysteria by calling it “an affliction of the mind.” The great medical authority of both Willis and Sydenham made it rare for physicians to relate the origin of hysteria to womb for a period of time.

At the eighteenth century, the category of hysteria suddenly became a prominent topic in medical discourse (Arnould 2015, p. 2). This resulted in the evaluation of more patients in the category of hysteria. It was thought that the excess blood which the physicians of the day accepted to be naturally present in the female body led to increased nervousness. According to conventional medicine, hysteria was chronic and quintessentially feminine.

There occurred another critical orientation in the history of hysteria in the late eighteenth and early nineteenth centuries. After 200 years, uterine theories of disease were reintroduced. The physicians of the period were preoccupied with the classification of diseases, and they linked hysteria to female sexuality in the new taxonomy. Besides uterine theories of hysteria, there

occurred many hybrid theories combining the components of different approaches. Meanwhile, Jean-Martin Charcot, who was leading a research on cerebral localization, multiple sclerosis, tabes dorsal, and amyotrophic lateral sclerosis at Salpetriere during the 1860s and 1870s, argued that such a neurological defect seen in hysteria resulted from the combination of hereditary predisposition and environmental factors in the form of physical or emotional shock. At the end of the eighteenth century, a group of previously known pathologies such as uterine furors, suffocation of the womb, fits of the mother, vapors, hysterical and hypochondriac passions assimilated into the category of hysteria. At about the same time, Hippolytus Bernheim and the other members of the Nancy School challenged the Charcotian doctrine by claiming that hysteria was an exaggerated psychological reaction. Like Bernheim, Pierre Janet argued that hysteria is a mental malady by proposing that obsessions, amnesias, fugue states, trances, and multiple personality resulted from the emotional traumas that had weakened the human psyche. During the same period, Sigmund Freud published a series of essays and books on his evolving views on psychoneurosis.

In his texts on the origin of hysteria, he reconceptualized medical thinking and, like Bernheim and Janet, claimed hysteria to be a psychological disease with some physical symptoms. According to the Freudian formulas, the reason behind hysteria was the repression of traumatic memories. Freud argued that negative emotional energy connected with the traumatic memories was unconsciously converted into somatic symptoms. Mark Micale (1995) takes attention to the fact that Freudian theory represents a second resexualization of hysteria by noting that “this time the sexual appears in the guise of an integrated psychosexuality rather than genital anatomy or reproductive biology” (p. 28). Freud believed that the patient’s symptoms disappeared when the past event, which had caused the hysterical repression, was brought into her conscious mental life. During the 1880s and 1890s, he set “free association” as the way to the treatment of hysteria. Following *Studies on Hysteria*, a 1895 book by Sigmund Freud and Joseph Breuer was the first psychoanalytic text,

and, in the history of hysteria, hysteria remained the primary pathology. On the personal level, psychoanalysis can be said to figure out the inner world of dreams and phantasies and the social influences; on the cultural level, Freud “connected the Catholic Church with religious, emotional, and sexual suppression” (Micale 1995, p. 58). He was so influential that it may well be said the history of hysteria in the first half of the twentieth century was shaped by psychoanalysis. Within this context, the final paradigm shift in the history of hysteria can be said to have taken place. Psychological models started to take place of the gynecological, demonological, and neurological models of the previous centuries.

In a period when hysteria was seen as exclusive to women, “shell shock” changed this dominant view in medical discourse. In such wars as the Balkan War of 1912–1913, the American Civil War (1861–1865), and, finally and most importantly, the First World War, many of soldiers showed symptoms which could not be explained by organic causes alone. The scale of mass slaughter and the daily sense of losing control while waiting in the midst of an inescapable situation wore on men’s wars. Army doctors felt a need to explain what was wrong and how it could be cured: “Army medics were perforce handed a dual task: to explain what had gone wrong; and to develop remedies that would, in the shortest time possible and to the maximum extent possible, return those they treated to the military machine so that they could kill and be killed” (Scull 2009, p. 157). The term “shell shock” refers to mass nervous breakdowns in the Great War. The force of the high-explosive projectiles traumatized the soldiers who were exposed to it. For others who were not wounded yet, it was the waiting and watching others that wore the nerves. Therefore, hysteria was on the scene again. Before the war, the views of Babinski were found deeply controversial, but the shell shock epidemic in the Great War led many to accept his view that the victims of the syndrome were hysterics and their symptoms were the product of suggestion so they might be cured by persuasion. The role of traumatic memories, repression, the conversion syndrome, and the significance of dreams were all important

in understanding shell shock which was a manifestation of hysteria. However, interestingly and understandably, a connection between shell shock and cowardice was established in the patriarchal order that equates being a man with being powerful and invincible, and “the French, the Germans, the Austrians, and the British all responded to the catastrophic threat to military manpower by employing a mixture of ‘conscious suggestion, reinforced by electrotherapy’” (Scull 2009, p. 169). Army medicals seeing autosuggestion fed by emotional tension outnumbered those who saw psychoanalytic methods of treatment, such as Charles S. Myers. The soldiers returning from the front during the Second World War did not have shell shock, but they had war neurosis or combat exhaustion. Andrew Scull (2009) sees this change in terminology significant: “The change in terminology was no accident. The doctors discovered that the less ‘psychiatric’ the diagnosis the better, since a psychiatric label seemed to confirm victims in the sick role and make their recovery unlikely” (p. 180). The re-biologization of psychiatry after the war eliminated the use of hysteria, and those suffering from wars were told to have post-traumatic stress disorder.

The absence of hysteria in the medical discourse today does not mean its symptoms disappeared. As Canadian medical historian Edward Shorter suggests, there is a symptom pool from which an unconscious selection of the kind of somatization is made. A particular cultural and social setting determines the nature of such somatization; there were possessions in the medieval and early modern period; swooning in the eighteenth century; paralyzes, seizures, and gait disturbances in the nineteenth century; and conversion disorders and somatoform disorders in the present day. When talking about hysteria, different types of images with different kinds of interpretation developed throughout time: “The relation to the extraordinary, the unexpected, and the troubling was transformed and given a space within the qualification of the pathology. As a result of this process, the operation of connotation became essential to the functioning of knowledge” (Arnould 2015, p. 55). It may well be concluded that not all dynamics in

the interplays of power, value, and affect can be explained and that the relation between hysteria and religion will develop on the continuously changing dynamics.

I Ching

Nathalie Pilard

King's College, School of Divinity, University of
Aberdeen, Aberdeen, UK

The *I Ching*, or Book (*I*) of Changes (*Ching*), belongs to the greatest treasures of religion; it is hierarchically the first of Old China's Five Classics (the four other Classics are the *Shu Ching*, or The Book of History (rules for Politics); the *Shih Ching*, or The Book of Odes; the *Li Chi*, or The Book of Rites; the *Ch'un Ch'in*, or The Spring and Autumn Annals, annals of one Chinese province where Confucius lived).

A Twofold Structure: Oracular Formulae and (Official) Commentaries

Ten centuries of successive stratifications of practices and texts frame this monument of Chinese wisdom, whose secrets have not yet all been discovered by archeologists, philologists, and after them theologians or thinkers. Out of divination customs from the Shang dynasty (1750–1050 BCE) appeared, during the Chou dynasty (1050–771 BCE), the ancestor of the *I Ching*, the *Chou I*, or Changes of Chou, a compilation of oracular formulae. From the eighth century before the Common Era to the second of the

Common Era, hundreds of commentaries joined the collection. Carefully selected and corrected under the Han dynasty (206 BCE–220 CE), they became the official Ten Wings which “protected” the *Chou I* and allowed its understanding. The twofold structure of the *I Ching*, the compilation and – its hermeneutical ground – the official commentaries, was then fixed.

The eastern *Chou I* consists of 450 oracular formulae attached to each of the 64 hexagrams of the book and to each of their constituting six monograms or lines. A line, as the result of a divinatory casting, can be broken and *yin* (—) or unbroken and *yang* (—). The opposition and the complementarity of these two principles are emphasized in the two opening hexagrams of the compilation, which each possess a supplementary formula ($64 + (6 \cdot 64) + 2 = 450$). Made of six unbroken lines and six broken lines, the first hexagram, “The Creative,” and the second one, “The Receptive,” are the immanence of *yang* and *yin*. *Yang* is first, *yin* second, and together they give birth to all the “existents,” all the things that exist in the three levels heaven, humanity, and earth.

The Ten Wings provide numerous keys and rules for the reading and casting of the oracle. Some are technical and theoretical; others are more philosophical. The respect of hierarchy and the correctness of the position characterize the two main guiding principles of the Wings. All the 64 hexagrams and the complex rules of their triagrams and lines are assumed to symbolize all

situations likely to happen in the course of the universe. For instance, there are inferior, nuclear, and superior trigrams at work in the hexagram; the sixth line is the king's line, the fifth the prince's, the first, third, and fifth lines are correct if unbroken but have also to behave with regard to their neighbor lines, etc. Hence a casting of the oracle supplies the reader with a statement which is the present correct position in the Tao he or she has to follow. The sixth and the seventh Wings form the *Ta Chuan*, The Great Treatise, a major work of the Chinese thought. First attributed to Confucius himself, it was in fact written after his death. Integrating both Taoist and Buddhist thoughts, it expresses the Old Chinese vision of the world, where reality is the daughter of the process of the Tao and where humans, thanks to the right attitude of morality, have to find their way between heaven and earth. The eighth Wing is the *Shuo Kua*, the "Discussion of the Trigrams." These trigrams belong to the mythology of the *I Ching*.

The wise ancestor Fu Hsi is, for the tradition, the first of the four authors of the *Book of Changes*, with King Wên, the Duke of Chou, and Confucius. He is the one who discovered, rather than created, these eight original trigrams, the eight possible combinations of three unbroken and broken lines, the symbols (or images, *xiang*) of heaven, the earth, the thunder, the water, the wind, the fire, the wind, and the lake. This is the naturalist and cosmological foundation of the *Book of Changes*. The natural "Resonance" (*kan-ying*) heard between all existents (see Le Blanc 2003) allows the *I Ching*'s operation of connecting together the structures within the perpetual process of the Tao, the Changes. This Chinese theory is close to the Western notions of macro and micro cosmos, to Goethe's elective affinities, and to Baudelaire's correspondences. The *I Ching* is thus supposed to be the impression and the symbol of the everlasting wholeness and emptiness of the wise man which relate the reader to its correspondence of the moment, to its affinity and duty.

philosophical hermeneutics of the work but rather enlightens its oldest utilizations and goals. Recent archeological discoveries (see Kalinowski 2006) showed that the *I Ching* has been used differently than was previously thought. The three assumed separate and successive stages of the book – religious, divinatory, and philosophical – are no longer taken for granted, reality proved to be more complicated. The religious age was characterized by the casting of the oracles – turtles or stalk of milfoil – which allowed humans to communicate with their ancestors or gods. The collective procedure testified to the fear for the gods who were asked for authorizations to act through the intermediate of the oracle which transmitted both questions and answers. The utilization of the *Chou I* – the different compilations of oracular sentences and the turtle or milfoil material – within a sheer divinatory context had different goals. Individuals from all groups used to consult local wise men, having expectations on their future. The philosophical age supposedly drained these too numerous practices around the *Chou I* to give birth in the second century to the Commentaries which would form the *I Ching*. In fact, the recent discovery of inscriptions on carapaces of turtles showed that religious purposes remained till high antiquity. In this period, divination still belonged to religious rituals. As early as the fourth century BCE, there appeared the philosophical stage with Confucius using the *Chou I* in order to spread Confucianism. This political concern coexisted with the divinatory use of the compilation, like religion had coexisted with divination.

Since the fixation of the work at the second century till now, many commentaries by the most eminent Chinese thinkers have secured the actuality of the living aspect of the book, like new other wings. The desire to penetrate the intrinsic mystery of the "Classic of the Classics" remains. In the twentieth century, the work became known in the West thanks to the German Protestant missionary Richard Wilhelm's translation, itself retranslated into English by one of C. G. Jung's pupil, Cary Baynes.

Philology and History (of the I Ching)

Near to the traditional myth of the book stands its scientific history which does not cancel out the

(I Ching) Jung and Spirituality

C. G. Jung discovered the *I Ching* with James Legge's translation in the 1910s, but the

reading of Richard Wilhelm's met his understanding of the huge symbolic aspect of the canon, disregarded by Legge. After the rift with Sigmund Freud in 1911, the *I Ching* was the superior voice, intuition embodied, which intimated Jung to find his own way. Companion of the personal Jung, the *Book of Changes* sometimes entered his consulting room, but never really reached the sacred area of his works until 1948 and 1949, the dates of the two forewords of Baynes's translation (see Pilard 2009).

The writing of 1948 constitutes the published foreword of 1949's draft, but the significance of the differences between the two texts allows the designation of the first and second foreword to the *I Ching*. The text of 1948 reveals the first risk taken by Jung: introducing the intuitive book among Western rationalism by a personal casting of the oracle rather than a simple theoretical commentary. The text of 1949 constitutes the second risk: introducing the Eastern theoretical background of the *I Ching* within his own Western thinking. It is the public birth of synchronicity. Both risks were considerable but, to Jung's eyes, indispensable. A sheer commentary would have let Jung be an observer, seemingly objective, in front of the masterpiece. The traditional casting of the *I Ching* involves subjectivity in order to correct it and to redirect it in the Tao, by providing the objectivity the reader cannot pretend to have a priori. Jung chose to render this necessary implication in a living dialog between him and the book. He interrogated the *I Ching* about its introduction in the English-spoken world and his own role on the event, getting from it an optimistic answer the future would confirm.

The second foreword of 1949 replaces five pages out of 20 in order to introduce, for the first time, the notion of synchronicity. Jung's contemporaneous correspondence shows the significant role of the Physics Nobel Prize Wolfgang Pauli in the psychologist's decision to reveal his controversial concept. Since Albert Einstein, whom Jung had met years earlier, and current discoveries of atomic physics, objectivity and the laws of causality had been ipso facto challenged, but science had not found any

competitor yet among thinkers for this crucial debate.

Within rational language, synchronicity means acausality. Two events happen not to be linked by causes and effects but by meaning grounds. This is the translation of the Chinese theory of Resonance in one scientific hypothesis. Practically, the "meaningful coincidences" between the two events reveal the theory, but do not prove it, as they happen only once. The *I Ching*, as the agent likely to connect all the existents, is the one able to repeat, at will, these meaningful coincidences between the question of the reader and its symbolic answer. Synchronicity does not undermine causality but on the contrary completes it. It is a working but needed hypothesis based on the inability of reason to grasp the whole reality.

Religious Attitude and Depth Psychology

The efficiency of synchronicity hence resides in any personal casting of the *I Ching*. However, the right interpretation of the esoteric language of the book belongs to the right attitude of the reader. The religious attitude towards the book that Jung thinks the reader must keep corresponds to the accurate attitude that one must have towards the unconscious. The remarkable inner knowledge that the messages of the *I Ching* provide to moderns should remain as respected as these provided by the same medium to ancients then understood as the gods' orders. This idea appeared in Jung's foreword embodied in the casting of the hexagram of the Caldron, the *ting*. In Old China, the *ting* was a ceremonial vessel used in banquets to link humans to gods. In Jung's casting, the *I Ching* saw himself as the Caldron. Thanks to Baynes's translation and Jung's foreword, it was thus able to connect gods to humans, East to West, and past to present. This symbolic object contained Jung's will to transmit the respect towards the book the reader must have. Since individual, with no support of social or collective instinct, a modern casting requires humility and simplicity before any interpretation, the same way the

psychologist depicted the correct attitude towards a dream.

The *I Ching* entered Jung's world and life by intuition. His recognition of it was immediate. Jung saw archetypes in the 64 *xiang*, symbols in each line. He instinctively used his method of amplification to translate one monogram in his foreword. He could have seen in the *I Ching* a manifestation of the Self. But above all, Jung recognized that the *Book of Changes* was an impression of the world in its wholeness in symbols. No language, either psychological or rational, can exhaust its meaning, its process, and its vitality. Those interested in the Old China wisdom can read and cast the *Book of Changes*. Anybody who asks himself the question "What do I have to do in order to..." can use the oracle. A fortune teller could answer by a prediction but then would stop one's implication in the process of the event. A friend could offer an advice, but some acts must be decided alone. The *I Ching* is supposed to provide a perspective: some radial point of view whose center is the question of the reader. The more the question is clear and necessary, the more accurate the answer will appear to the "humble" and "simple" asker.

Ibn al-'Arabi

Fredrica R. Halligan

Mind Body Spirit Institute, Stamford, CT, USA

An Islamic mystic, known as the "Greatest Master" (*Shaykh Al-Akbar*), Muhiyuddin Ibn al-'Arabi (1165–1240 CE), grew up in Seville, where Islamic, Jewish, and Christian mysticism flourished with mutual enrichment. He was educated by Sufi masters in alchemy and esoteric studies as well as Moslem scriptures and traditions.

Ibn 'Arabi possessed prophetic gifts and psychic abilities and was thought to be a "dazzling mental force" (Husaini 1996, p. 6f).

The lives of mystics provide psychological insight into the upper reaches of consciousness where we discover, in the psychological processes of highly evolved persons such as Ibn 'Arabi, a broader and deeper understanding of the essential issues involved in psychospiritual development to its fullest potential.

All Moslems seek to live under the sovereignty of God, since "Islam" itself means "surrender." God is viewed as active in human affairs, and each person aims to fulfill His Will. A central objective is unity with God (*tawhid*). Among medieval Sufis, asceticism and renunciation were highly valued, and Ibn 'Arabi was tenacious in his efforts to perfect himself so as to be worthy of divine union. His life was totally dedicated, aiming to achieve personal annihilation in the Divine Presence.

Following an internally mediated sense of "call," he traveled widely in Spain, North Africa, and the Middle East. When disciples were attracted to his spiritual power, he taught with clarity and spiritual authority, always emphasizing quotations from the Qur'an and traditional stories of the Prophet Muhammad [*Hadith*] while interpreting and embellishing the scripture with the fruits of his own experiential wisdom.

He lived several years in Mecca where he frequently circumambulated the Ka'ba in rapture, repeatedly receiving mystical experiences. His most prolific writings began in Mecca and were continually sustained by his mystic insights. Finally, at age 58, he settled in Damascus where he lived his last 15 years, finishing his major writings: *The Meccan Revelations*, *The Bezels of Wisdom*, and *The Diwan*.

Dreams and Visions

At midlife Ibn 'Arabi had a dream: "I was wedded to all the stars of the sky. There was not a single star left, and I married every one of them with great spiritual pleasure. Then I married the moons" (Ibn 'Arabi cited in Husaini 1996, p. 6). This dream of mystical marriage reveals his spiritual expansiveness and forthcoming awareness of divine union.

Islam characteristically emphasizes prophecy, with dreams seen as typical ways that God communicates with humanity. Like Muhammad before him, Ibn 'Arabi claimed his writings (over 400) were in obedience to divine command. *The Bezels of Wisdom*, for example, was given to him in a single dream. By surrendering his own will, he followed the Sufi path of heart, obeying the Prophet's summons to vision (Corbin 1969, p. 232). In a visionary's life, complete annihilation (*fana*) in the Divine opens the doors to imaginative perception of Divine Realities. This marriage, when the visionary and God are united, is a common theme.

Divine Messengers frequently inspired and brought him insights. In Mecca a powerful vision of a female Beloved had great influence on his writing and his experience of Divine Love: "While circumambulating the Temple [ruminating]... [s]uddenly there emerged from the shadows the feminine figure who was for him the earthly manifestation of *Sophia aeterna*" (Corbin 1969, p. 278). She rebuked him for seeking intellectual answers to questions that were essentially mystical, and she taught him to trust

the illuminations and wisdom of his heart. Ibn 'Arabi alluded to this young woman as an "apparitional figure," both "sublime and divine," one who "manifested...visibly...with such sweetness as to provoke...joy and happiness" (Ibn 'Arabi cited in Corbin 1969, p. 139). Another of Ibn 'Arabi's archetypal Messengers was Khidr, the Verdant one, associated with Elijah and Shi'ite liturgy. "[T]he fact of having Khidr for a master invests the disciple, as an individual, with a transcendent, 'transhistorical' dimension...it is a personal, direct, and immediate bond with the Godhead" (Corbin 1969, p. 54).

Immersed in the divine milieu, Ibn 'Arabi developed to the point where he consciously experienced all life as manifestation of the Divine. He saw theophany everywhere and would interpret even the smallest coincidences as symbolic communications. Night and day were God filled, living in mystic love and gnostic intuition.

In summarizing Ibn 'Arabi's psychospiritual development, it appears that his mystical experiences began with dreams, progressing with the appearance of fleeting dreamlike images during wakefulness, as well as locutions that voiced Divine Commands quite directly. Then, as he became more attuned to subtle messages, more surrendered, and more obedient to the Divine Intent, the visions appeared more full bodied, more human, and "real." Finally, all life became a communication from God for himself as mystic lover.

Active Imagination

For Ibn 'Arabi, intuition occurs in the heart as "Active Imagination" (*alam al-mithal*), an intermediate world – neither matter nor spirit – but some sacred space between, similar to Jung's Collective Unconscious. He distinguishes premeditated imaginations evoked consciously, from those imaginative products that present themselves to the mind spontaneously like dreams (or daydreams). The spontaneous process or "autonomous imagination" (*munfasil*) is the

special locale of dreams, fleeting images, and spontaneous visions, which were commonly reported by the Prophet Muhammad and by many Sufis.

In the intimate relationship between matter and spirit, the energy flow of Active Imagination is bidirectional. The human (matter) evokes Spirit, reaching up, with prayers of the heart, expressing needs and inviting spiritual intervention. God reaches down, sending a message (e.g., the image of an angel); thus, Spirit is made matter. In these transmutations of energy, matter becomes Spirit and Spirit becomes matter in the intermediate world of the creative Active Imagination.

For Ibn 'Arabi, God uses the human faculty of imagination for Self-revelation, entering consciousness through the door of imaginative processes. "Unveiling . . . is knowledge that God gives directly to the servants when He lifts the veil separating Himself from them and 'opens the door' to perception of invisible realities. . . . Unveiling is an everyday occurrence for prophets [and] for the friends of God [Sufis]" (Chittick 1998, p. xxii f).

Ibn 'Arabi discovered, as have many other mystics, that rational thought actually blocks spontaneous imaginal processes. Anyone can fall into intellectualization, but those who think they know are not open to receiving revelations. The role of the gnostic, the prophet, or the Sufi is to temporarily suspend rational judgment in order to perceive through the imaginal pathways. The desire of the heart is what the aspirant brings to the mystic encounter. Surrender of the ego in a state of annihilation (*fana*) allows the individual to release the illusion of separateness and to perceive the unity underlying all life. "The mystic is then the medium, the intermediary, through whom the divine creative power is expressed and manifested" (Corbin 1969, p. 228).

Ibn 'Arabi's world of imaginal reality pre-dates contemporary psychoanalysis by over 600 years, but one finds understanding of the unconscious, such as Freud's idea of dreams as wish fulfillment and Jung's idea that psychic energy is found primarily at the region where the opposites meet.

Conjunctio Oppositorum

The theme of unity of opposites (*conjunctio oppositorum*) was a predominant alchemical pre-occupation, one that fascinated Ibn 'Arabi, even as it did Jung six centuries later. For Jung, the union of all opposites comprises the ever-emerging psychospiritual Self, while for Ibn 'Arabi, the union of opposites is experiential evidence of the underlying Oneness of Being. Thus it seems that the one theorist (Jung) was working at the level of the Immanent, the other (Ibn 'Arabi) at the level of the Transcendent. But even this duality must be encountered in unity. The Immanent Divine and Transcendent Divine are essentially the same. Ibn 'Arabi recognized this unity: "There is but one Essence. . . . He who is universal is particular [while] He who is particular is universal" (Ibn al-'Arabi 1980, p. 150). Self and God are One. For those who can see, multiplicity and oneness are similarly linked. Ibn 'Arabi writes, ". . . he who has attained to realization sees multiplicity in the One, just as he knows that essential oneness is implicit in the [multiple] divine Names" (Ibn al-'Arabi 1980, p. 153).

Another duality to transcend is the polarity of active and passive. In a full life, both action and contemplation are needed. Ibn 'Arabi also grappled with paradox: how apparent passivity may, in fact, be activity and vice versa. Reflecting on the Qur'an verse, "You will not will unless God wills" (*Qur'an* 76:30), Ibn 'Arabi sees the question as: Whose action is it? When one shoots an arrow, who really shoots? Who really hits the mark? His commentary on this paradox is related to predestination versus human choice.

We say, concerning the relation of choice, that God created for the servant a will through which he wills as a property of this relation. This newly arrived will derives from God's will. God says, "*You will not will unless God wills.*" [76:30] Thereby He affirms will for Him and for us, and He makes our will dependent upon His will (Ibn 'Arabi cited in Chittick 1998, p. 59).

Here the mystic delights in paradox, a dance of opposites that cannot be separated. The question of "Who wills?" has implications in conscious

experience: if one has surrendered entirely to God's Will, then one is essentially passive (in terms of self-will and control) even while being thoroughly active (in terms of behavior.) Thus, as *conjunctio oppositorum*, activity and passivity are one.

The ultimate *conjunctio oppositorum* is God, both Manifest and Unmanifest. For Ibn 'Arabi the omnipresence of God is central. He perceives the Godhead as having five levels and infinite variety of manifestations in a vast Oneness of Being.

The first of these five planes of Being... is Reality in its first and primordial Absoluteness or the absolute Being itself. It is the Absolute *before* it begins to manifest itself, i.e., the Absolute in a state in which it does not yet show even the slightest foreboding of self-manifestation. The four remaining stages are the essential forms in which the Absolute "descends" from its absoluteness and manifests itself on levels that are to us more real and concrete. This self-manifesting activity of the Absolute is called by Ibn 'Arabi *tajalli*, a word which literally means disclosing something hidden behind a veil (Izutsu 1983, p. 20).

The remaining levels of unveiling are the Absolute manifesting itself as:

1. God: the One of many Names (Allah, Yahweh, Brahman, etc.)
2. Lord: Divine Incarnation (e.g., Jesus)
3. Human: half-spiritual, half-animal beings
4. The sensible world: every aspect of the cosmos (animal, vegetable, and mineral)

Ibn 'Arabi was thus a pantheistic monist. "[E]verything in Ibn 'Arabi's world-view, whether spiritual or material, invisible or visible, is *tajalli* [manifestation] of the Absolute except the Absolute in its absoluteness" (Izutsu 1983, p. 20). From the smallest to the largest element of the universe, all is a manifestation of the Divine, and to that Divine Source, all will ultimately return.

In Ibn 'Arabi's writings, the Active Imagination is the locus of unification, the matrix out of which the *conjunctio oppositorum* arises. Essentially God is unity, so is humanity. And humanity –

good and evil alike – is part of the Godhead, the great Oneness of Being.

As we in the twenty-first century observe our global community in its struggles to unite, we find that we have much to learn from those wise mystics who understood unity at its deepest levels. Christian, Muslim, and Jew can still learn from one another. Psychology can contribute by modeling respect and the capacity to listen and ponder in depth the worldview and spiritual perspectives of other cultures.

Iconography

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Since the earliest times of human evolution, we have communicated with each other by visual

means as well as verbal. In semiotics, which is the study of signs and their meanings, the term icon refers to any kind of visual sign. Thus, in a religious context, iconography is the study of the spiritual or religious significance of visual signs or symbols. These can be concrete objects in three dimensions (statues, even buildings) or pictorial representations of symbols in two dimensions or even gestures by live actors used in religious settings. Iconography is often seen as a sub-discipline of art history.

Religions differ with regard to the status of visual representations of the person of God or significant religious figures. In the Western monotheisms, there is a prohibition of the use of idols to represent the divine. In Christianity this has been relaxed somewhat with regard to portrayals of religious persons, especially in Roman Catholic, Eastern Orthodox, and Anglican traditions. Statues of Jesus, Mary, and a wide variety of saints are found in most churches, cathedrals, or other buildings. In Judaism the use of personal images of religious figures is uncommon, though some illustrations of prophets or other personages are not prohibited. In Islam there is a strict prohibition of portrayals of God or the Prophet Muhammad. Islam has developed its own form of visual decoration using plant and animal motifs in tiles as decorative aspects to sacred buildings and widely uses calligraphy, especially in the stylized Kufic script of Arabic to visually present scriptural material from the Qur'an.

Hinduism has no qualms about representing the various forms of divinity in sculpture or painting. While Buddhism has less emphasis on the personhood of the divine or transcendent, there are numerous representations of the Buddha, various bodhisattvas, and, especially in Tibetan tradition, a whole panoply of demigods, demons, major religious figures, and founders of significant schools of Buddhism. The classical pagan religions of the ancient world were likewise quite comfortable in portraying divine or semidivine persons graphically. It is, however, an oversimplification to say that the pagans worshiped idols. They were quite aware that the statues of their deities were representations for persons or powers that transcended the physical

manifestations. It is also true, however, that the deities could come to dwell within their statues and be physically present to the worshippers.

Especially when dealing with complex polytheistic pantheons, iconography is important to distinguish exactly which deity is being portrayed. Thus the basic human shape in male or female form was enhanced by certain clothing, physical characteristics, objects held, and so on. In Egypt, many of the deities are therianthropic, that is they were portrayed as half human and half animal. For example, Thoth could be distinguished from Horus, as the former had the head of an ibis, whereas the latter had the head of a hawk. In both Hinduism and Buddhism, the human form could go beyond the literal form and have many arms. In each hand the deity could grasp a different implement and these represented various qualities of the deity or bodhisattva.

Likewise, among Christian saints, St. Sebastian is usually portrayed as pierced by numerous arrows, his means of martyrdom. St. Roche, the patron of the plague, is portrayed lifting his tunic and revealing the buboes on the inguinal part of his leg. St. Francis is often portrayed in the brown habit of the order he founded with birds or other animals. Blue has come to be associated with Mary, the mother of Jesus, and her mantle usually takes that color.

Gesture is likewise a party of iconography. For Christians, making the sign of the cross is part of the Mass, or Eucharist, which is initiated by the priest and copied by the laity. The gesture of prayer, orans, is made with arms open at or above waist level, palms facing up. The gesture of blessing is made with two fingers of the hand. In Hindu and Buddhist traditions, various hand gestures, known as mudras, are performed in the act of worship or meditation. Indeed, all the bodily postures of yoga, the asanas, have a quasi-representational quality; the plow, the locust, and the thunderbolt are used both as mnemonics for the pose itself but embody aspects of the thing the pose represents.

Recently, the understanding of the origins of Paleolithic rock art has been understood in light of the neuropsychology of altered states of

consciousness (ASC). The cross-cultural similarities in very early, largely geometric designs have been linked to shamanic visionary experiences (Lewis-Williams and Dowson 1988). Entoptic (behind the eye) phenomena are common to many ASCs, and while cultural significances may still vary, the possibility of an iconography of primitive spirituality and religion is enhanced.

Iconography catalogs and explains the meaning of all the graphic devices used to convey religious or spiritual significance. Whether it is in the form of personal representations of the deity, saints, or other religious figures, or whether it is in the form of symbols representing abstractions, or whether it is in the live use of gesture during worship, visual signs are a major part of most religious traditions.

Psychologically speaking, iconography is the playbook by which visual imagery of the divine and the unfolding human understanding of spiritual experience is encoded and recorded. We can use the playbook to unlock meaning in existing visual representations and to create new ones through modification and combination of visual elements. Thus, as our spiritual experiences continue vary, iconography provides sources of continuity and a fertile field for change.

Id

Stefanie Teitelbaum

Faculty of National Psychological Association for Psychoanalysis (NPAP), New York, NY, USA
Institute for Expressive Analysis (IEA),
New York, NY, USA

Introduction

The Id is the Latin translation of Sigmund Freud's "das es." A direct English translation of "das es" is "the it." This translation is used in the Standard Edition of the Complete Works of Sigmund Freud. The id is the psychical agency in Freud's structural topography of the psyche which is unconscious, containing repressed innate instincts and primordial objects and adapted or psychically determined drives and objects. For Freud, the goal of psychoanalysis is to tame and transform the energy and objects of the id, moving them to the ego and superego in the service of civilization.

The id has no formal place in religious and spiritual literature. Freud acknowledged that his "it" was significantly influenced by the physician analyst Georg Groddeck, whose "it" concept is both compatible with and divergent from Freud's. Groddeck's "it" is "all" and "The Other" of human experience, lending itself to interpretations of the innate presence of the Divine or the godhead in human existence.

Psychology

1923: Georg Groddeck published *The Book of the It*. Groddeck "it" is all, and the experience of ego

“I” is illusion. Words like id-*iom* and id-*iosynchronic* suggest the authentic individuality of the personality is id derived (Bollas 1992). While comparisons have been drawn between Groddeck’s “it” and the Tao and detachment, his influences are from Greek philosophy and German Romanticism (Durrell 1949).

1923: Sigmund Freud published *The Ego and the Id*, which contained the first mention of the id. In his earlier writings, Freud laid out conceptual models of the workings of the mind in metatheory or metapsychology which are fictional representations of mental processes. The first topographical metapsychology has three psychical agencies: system unconscious, system preconscious, and system perception conscious. The second topography, the structural model, consists of the Id, the it; the Ego, the I; and the Superego, the over-I. The second topography was primarily laid out and elaborated in *Beyond the Pleasure Principle*, and *The Ego and the Id* (1923). Both topographies were efforts to describe and explain the movement of libido to occupy or cathect the psyche’s agencies and developmental zones. Freud acknowledged Groddeck’s influence in conceiving the second topography: “by following Groddeck in calling the other part of the mind into which this entity extends and which behaves as though it were Ucs, the ‘id’.” Freud called the id the “great reservoir of libido.” The movement of libido between id, ego, and superego is the subject of Freud’s Economic metatheory; the conflict between id, ego, and superego is the topic of the dynamic metatheory. The second topography was driven, in part, by Freud’s Revision of the Theory of Instincts and the conflict between the sexual instincts and the ego instincts (LaPlanche and Pontalis 1973).

Freud said “where id was, ego shall be.” He stated that the goal of psychoanalysis was “to strengthen the ego, to make it more independent of the super-ego, to widen its field of perception and to enlarge its organization, so that it can appropriate fresh portions of the id. If it a work of culture not unlike the draining of the Zuider Zee” (1933).

Both Groddeck and Freud acknowledge their “it” concepts as influenced by Nietzsche’s “it” of general causation. Groddeck embraced the “it”

and minimized the primacy of the “I”; Freud’s “it” was to be tamed in the service of the “I.”

Religion

1923: Martin Buber published “I and Thou.” The concept of “it” as opposed to “thou” is central to that work. I and Thou seek to model subject-object relations as well as man’s relation with God. Buber seeks to transform God from an “it” object to be worshiped to a “you” with whom a subject had a relationship. Freud and Buber met and found much to admire and respect in each other, but their “its” are vastly different.

Commentary

Bruno Bettelheim (1982) challenged the Latinization of Freud’s id, ego, and superego metapsychology. The psyche itself is a Latin translation of “Die Seele,” the soul. Bettelheim posits that Freud accepted these mistranslations for two primary reasons: his wish to have the infant field of psychoanalysis accepted as a scientific discipline and his well-documented atheism.

The three “its” of Buber, Freud, and Groddeck were born in the English-speaking public’s consciousness in 1923. Only the it of Freud is the id. Existential psychoanalysis, as exemplified by, but not limited to R.D. Lang, finds place for some synthesis of the three “its” (Burston 2000). The “its” diverge and overlap in an effort to differentiate and facilitate a subject to subject relationship between self and self, self and other, humanity and the dehumanized, and man and god.

Ignatian Mysticism and Spirituality

Konrad Joseph Noronha
Center for Pastoral Management, Jnana Deepa
Vidyapeeth, Pune, Maharashtra, India

Introduction

Paths to finding God vary in different spiritualities. Although spiritual approaches might vary, the search is for the same – God. A Christian spiritual experience acknowledges that God is “for us” (NRSV, Rom 8:31), “with us” (NRSV,

Mt 1: 23), and “in us” (NRSV, Rom 5:1). Ignatian spirituality, a spirituality in the Roman Catholic tradition, with its gifts and characteristics is one such spirituality that evolved from the lived experience of St. Ignatius of Loyola (Herrera 2000), the founder of the Society of Jesus (Jesuits). He developed an understanding for guiding persons, which was different from what was present in his times. This spirituality is useful with clients who want religion or spirituality incorporated in their treatment.

Ignatian spirituality emphasizes that God can be encountered in creatures, images, and symbols, in everything, because God manifests in creation and salvation history. Also, Christ who is God's real symbol presents God (Egan 1978). Dulles (2013) posits that a client “seeks union with God within the mysteries through which God makes himself present in our world – especially the mysteries of the incarnate life of the eternal Son” (p. 28). Therefore God is present in the world, and can be known in the world through Jesus' life. This process is impacted and conditioned by culture. In therapy, a therapist could help a religious or spiritually oriented client move towards recovery through an understanding of his or her relationship with God or Jesus, via daily activities. Once the person is able to find God in his daily life, he or she will be able to immerse himself or herself more deeply in his or her work and activity.

The experiences of Ignatius of Loyola led him to write three major documents that are the cornerstones of Jesuit spirituality. The first is *The Spiritual Exercises* which presents his spiritual journey and which has become the mainstay for those who seek God in all things. The second is *The Autobiography* which details how Ignatius was led by God. The third is *The Constitutions* of the Society of Jesus. A fourth source is the ongoing congregational documents.

Cornerstones of Ignatian Spirituality

Ignatius' spirituality is Christ-centered, sacramental, and ecclesial. It is one of service, of reverential love, of the Cross, and of discernment (Dulles

2013). There are three stages in the evolution of the spirituality of Ignatius of Loyola: the quiet beginning period, the mystic night of the soul, and the period of Trinitarian visions (Rahner 1953). This has application in the therapeutic process. The initial phase which is about the gradual tangling with issues, the middle phase or the phase of dryness is the time of resistance and exploration, and the final phase is one of resolution and improvement. Also as Muldoon (2001) reports, Ignatian spirituality consists of the following essential features: the principle and foundation; finding God in all things; walking with Christ; the experiencing of consolation and desolation; and the ideal of social justice. These are essential features in therapy and need to be addressed with clients who would like religion and spirituality utilized in their therapy.

Loyola introduced modifications to ancient spiritual traditions that had important psychological, pedagogical, spiritual, and sociocultural effects. They were “a transition from reading exercises alone, to listening to them as they are being read aloud; the central role of a spiritual director as a mediator between text and practitioner; and the availability of spiritual exercises of introspection and spiritual growth to all believers, regardless of their societal status” (Sluhovsky 2013, p. 651). There was a mandate to listen to the movement of emotion and the affect of the client (Herrera 2000). The movement and emotion were not only about the positive, but also that God could be found in negative instances including failure, renunciation, sickness, poverty, and death (Dulles 2013). These are often issues that are dealt with in therapy. The director “listens, assigns exercises, and measures the impact of previously assigned exercises on the practitioner’s soul. He dispenses these exercises one by one, depending upon the practitioner’s own progress, state of being, position in life, and success or failure of previous exercises” (Sluhovsky 2013, p. 651). These changed understandings open up transformative processes that have important psychological undertones, as they involve the therapeutic alliance, education, homework, and action in and through society.

The Spiritual Exercises

The *Spiritual Exercises* is a manual used by the spiritual director to guide those making them so that God’s will can be found. They are divided into 4 weeks. The first week is about conflict where the reflections are mainly on the sin of the angels, human original sin, and one’s own particular sin. The second week is about discipleship where time is spent contemplating the public life of Jesus. The third week is about the passion of Jesus Christ where the level of opposition by those who rise up against Jesus and his followers is explored. The fourth week is about the resurrection and it takes one into the freedom of being children of God (Fink 2001). Similar movements are seen in psychotherapy, where the client moves from difficulties, to being freed from them, through a process of greater awareness.

This knowledge of God leads to action in the world, as “falling in love with God means falling in love with God who is active in this world and wants collaborators in that project” (Barry 2003, p. 26). Egan (1978) reiterates this about the *Spiritual Exercises*, saying that they “are remarkable in their ability to purify, illuminate, and transform those making them, so that God’s will can be discovered” (p. 416). The client reflects upon himself or herself discovering his or her personal, subjective anticipation of the saving mystery. In this way the client experiences the transcendental as well as the historical dimension of God’s self-communication. This understanding opens up the client to not just working and understanding himself or herself, but also living and acting in the world. This is how outcomes or goals are decided – by getting active in the world.

Discernment

An important characteristic of Ignatius’ spirituality are his rules for discernment (Herrera 2000). Ignatius of Loyola gives rules for discerning (Fleming 1978). The rules help in discerning by asking the client to notice consolations and desolations associated with the choice (Rehg 2002). It is:

the process of “knowing, judging, comprehending, distinguishing, and discriminating among the spirits, where some lead to consolation—an

increase in faith, hope, and love—and others to desolation—dryness, despair, and resentment. Those that lead to consolation are interpreted as from God, and those to desolation from the Devil”. (Higgins-D’Alessandro and Cecero 2003, p. 362)

The third week of the exercises is when a person struggles with these consolations and desolations and progress is noted when the person who has gone through the phases of questioning and suffering finds a sense of union, trust, and surrender in a mystery beyond comprehension (Maruca 1981). Knowing and understanding these movements is important in the psychological process too, as clients pass through such stages as they move towards recovery.

A Spirituality of Service

The true yardstick of Ignatius to measure his interior feelings and actions was his mission to help others. He gained this knowledge after becoming attuned to the complexity of feelings that were moving him in this process of awareness (Mooney 2009). The mystical in the Exercises results in a life and community transformed and directed by the Spirit of God towards the service of God’s kingdom (Buckley 1995). The outcome is that in helping others our thoughts, prayers, studies, and our entire life become truly spiritual. “Helping is what makes the totality of our life spiritual” (Molla 2014, p. 10). According to Buckley (1995), Ignatian spirituality is one in which the client is called to be of service with Christ, as follower and disciple. This has implications in clinical practices with clients, where the clients find ways to return to various activities, as that is where they will find their happiness, and God.

The Contemplation to Obtain Love

The contemplation to obtain love (Sp. Ex 230) (Fleming 1978) is the most important contemplation in the fourth week of the spiritual exercises. This contemplation is that love is manifested more by deeds than by words. Therefore we stand before the Lord and ask for interior knowledge of how much God has done for us (Hauser 2007). This contemplation has four insights:

The first is that everything that exists is born of God and that the dominant stance we must train ourselves in is praise and gratitude for all that is given to us. The second is that God dwells in God’s creatures and that truly to understand events in one’s life is to uncover the One who in everything desires to touch the human heart. The third is that through God’s dwelling God is offering himself. This is a sacramental view of the world that everything that happens presents the creator God to God’s creatures. The final movement of this contemplation is to grasp what it is that God is offering. Whether it be things of delight or things of sadness, events that are life-giving or events that seem to be destructive, through them all God is present. God offers himself in love, seeks to embrace us in love, seeks to transform us by love into love. (Fink 2001, p. 208.

Endean (1997) writes that what is important in this contemplation is that God gives, God inhabits, God works, and God descends. Molla (2014) posits that being contemplative is a condition for truly serving and involves seeing, listening to, attending to, and contemplating the reality of others and their needs. This understanding of Endean (1997) and Molla (2014) have strong implications for clinicians and clients in practice, with regard to seeing, listening, attending to, and contemplating reality.

Finding God in All Things

Roman Catholic spirituality stresses that God is above (transcendent) and also present in the world (immanent). Contemplating God can happen anywhere and anytime and need not be restricted to formal prayer periods and to specifically religious topics (Hauser 2007). Therefore, anyone can find God anytime, and in any place. The way to attain this is by making all experiences ways to meet God and includes prayer and service, friends, family, work, relationships, suffering, joy, nature, and music.

The heart of Ignatian spirituality is that the unity between the divine and the human is derived from the conviction that God has created, sustained, and loved a world in which the gift of life is itself the sign of God’s loving presence. God is present begging to be recognized, accepted, and loved in everything (Kelly 1995). Our lives are already the objects of God’s care. This fruit of finding God is “refined, validated or refuted

through consultation and dialogue with the ecclesial community” (Higgins-D’Alessandro and Cecero 2003, p. 363). Ignatian spirituality emphasizes the need to be present fully in the world and find the transcendent there (Molla 2014). Therapy and recovery emphasizes these aspects too, as the client has to get back to functioning in the world.

Conclusions

Thus, it is observed that Ignatian spirituality is a collaborative process between the master and the client (accompaniment), between the text of the spiritual exercises and how it is used in helping the client (particularity), and between what the client hears and practices in society and how it is communicated to him or her by the master (humanity). The application of this spirituality in working with clients is that it helps the client know and acknowledge not only what is happening deep within him on all aspects of his or her personality, but also at the deeper level of knowledge of God and God’s action in life.

Ignatius of Loyola

Paul Giblin

Loyola University, Chicago, IL, USA

Born of a noble family in the Basque region of Northern Spain in 1491, Inigo of Loyola was a great saint and mystic of the Church. His story is a rich study in the dynamics of *spiritual conversion* and psychological decision-making, i.e., how a young man in his late 1920s, a strong-willed soldier filled with zeal became a saint and mystic, deeply in love with God. His *Spiritual Exercises* document his process of grappling with life’s major questions, i.e., to whom and what is one to commit, how to assess the goodness of one’s choices, and how to live in accord with that

which gives life and freedom? Inigo's spiritual journey brought him into profound contact with Jesus Christ. His discernment of spirits and *Examen of Consciousness* provides tools for ongoing living in spiritual awareness.

Conversion

Inigo was born the youngest of 12 children to an aristocratic family. His mother died shortly after his birth. He was likely destined for the clerical state but by age 14–15 it became clear that he was much more interested in romance and chivalry. He trained to be a knight in the service of the King of Spain. He was described as full of life, with a strong ego and strong sense of vanity. Sword and cloak symbolized his identity. At age 20, in the service of the Duke of Navarre, he led a largely outnumbered body of Spanish soldiers against a French invasion of Pamplona. He was a fierce fighter, but within 6 h, the battle was over and he suffered a shattered knee and a seriously injured other leg. Two weeks later the French carried him by litter back to his family castle of Loyola. His convalescence did not go well. Surgeons had to rebreak and set the broken knee. Even then one of the reset bones protruded, and Ignatius demanded that it be cut away. William Meissner notes "His willingness to undergo the torment of the surgery is a measure of the extent the ego-ideal dominated his life and behavior to that point" (Meissner 1991, p. 41).

Following the second surgery Ignatius was confined to bed rest. His only reading material was a book on the lives of the saints and a book on the life of Christ. After reading and reading, he would fantasize himself "outsainting the saints" at one moment and at another pursuing knightly deeds in the service of a noble woman. He began to notice a difference in his moods after daydreaming. The aftereffects led on the one hand to stillness, peace, and joy and on the other hand to turmoil and dissatisfaction. He began to recognize God as directly instructing him; when he considered following Jesus' way of life, he was excited, and the excitement persisted. When he considered returning to his previous life of courtly

pursuits, an initial excitement quickly turned to emptiness. Ignatius felt himself being moved by two spirits, that of God in the former and that of evil and Satan in the latter. Thence began his lifelong love affair of God revealed in Jesus Christ. He wanted to go to Jerusalem and experience the Gospel accounts firsthand; he left Loyola castle in 1522.

He travelled to the Benedictine monastery of Montserrat where he surrendered his knightly attire and took on pilgrim clothing. He confessed his sins in great detail and emerged with a stronger spiritual identity. He departed Montserrat with intentions of staying a few days in the remote hill town of Manresa on route to Barcelona and then on to Jerusalem. Ignatius in fact stayed in Manresa for 10 months, living in a hillside cave, fasting and begging, and praying for long hours. His health became poor and he suffered from severe depression. During this time, as back in the castle at Loyola, Ignatius continued to "conduct his experiments" in consciousness, attending to his mood shifts/"movement of the spirits" and recording notes about the Gospel passages influencing him. These were to become the basis for the *Spiritual Exercises*. At the end of the time at Manresa, along the river Cardoner, Ignatius had a profound religious experience, "the great illumination of his life." He came to understand his faith in powerful new way. Ronald Modras notes "Manresa made him a changed man; at the Cardoner he was given a purpose" (Modras 2004, p.18).

Experience taught Ignatius that God was acting in his and other's lives; that all people can have this direct, personal encounter with God in Jesus Christ; that all we have and are is gift from God; and that we are loved in spite of our limitations and sinfulness, and in realizing and appreciating these things, we are called to love and service.

Ignatius would go on to preach the Gospel, "help souls," and engage in spiritual "conversations." He realized the need to be educated; studied Latin, the Classics, philosophy, and theology; and was ordained. He continued to refine his notes on and give the *Spiritual Exercises*. A small group of fellow students and companions gathered around him in Paris to share the Exercises and

Ignatius' transformative vision. Together they were intent on becoming missionaries and putting themselves at the service of the Pope.

The group practiced "discernment of spirits" and together, in 1540, founded the Society of Jesus, the Jesuits. Ignatius, its first Superior General, would remain in Rome until his death at age 65 in 1556.

The Spiritual Exercises

Ignatius developed a keen interest in the inner life and the interplay between desire and the feelings and thoughts that follow from entertaining various desires. As he recuperated in Loyola castle and on pilgrimage at Montserrat and Manresa, he became convinced that God was acting in his life. He read and reflected on Christ's life and the lives of the saints and felt himself being drawn into an intimate relationship with God in Jesus. He continued to take notes on these experiences and refine the notes over the next 20 years. His notes became the basis for guiding others on a similar spiritual journey. The intention of the Exercises is to bring one's spiritual journey into focus and to help clarify a sense of life purpose, ultimately grounding that life in the fullness intended for each of us by God. The Exercises provide a very concrete and adaptable method for spiritual guidance that was quite distinct from the more logical, ritualized forms of religious practice dominant in the sixteenth century. They provide a highly positive view of God's action in the world, a world that continues to be created and which invites human participation.

The Exercises encourage a variety of prayer forms including imaginative reflection on the Gospels, *lectio divina*, breathing and full use of the senses, dialogue with inner wisdom/God, and especially paying attention to the movements of one's heart. Prayer sessions begin with attention to the desires of one's heart. The structure of the Exercises is "4 weeks." These are not chronological weeks but rather periods of focused prayer seeking specific graces. Week 1 focuses on the "purgative way," examining one's faults ("doing

one's personal inventory" in other spiritual language) with the goal of choosing God over sin. Week 2 focuses on the "illuminative way" with the intention of better knowing, loving, and serving God. Week 3 and 4 focus on the passion, death, and resurrection of Christ, the "unitive way," identifying with his suffering and then with his joy, with the intention of strengthening one's commitment to follow Christ.

The *Spiritual Exercises* are not a book to be read but rather notes for the director to use with a retreatant. They are given in a variety of forms. The more extended form is a 30-day retreat. Each Jesuit typically makes the "30-day retreat" twice in his life. They are also given in an 8-day retreat, often yearly for the retreatant; a third form is the more extended 9-month retreat entitled the "Nineteenth Annotation," designed for lay people who wish to make the Exercises in the context of ongoing life. The Exercises are offered and tailored to individuals and to groups.

Examen of Consciousness

Central to the practice of Ignatian spirituality is the Examen. Originally understood this was an examination of conscience, a twice-daily reflection on the shortcomings of one's life. A contemporary understanding is an examination of consciousness and a tool for living a more spiritually aware life. Typically five steps are recommended (Hamm 1994): (1) pray for light, to understand how God's Spirit is acting in our life; (2) review the day in thanksgiving for "gratitude is the foundation of our whole relationship with God"; (3) review the feelings that surface in the replay of the day, pay attention to any and all the feelings that arise; (4) choose one of those feelings, positive or negative, and pray from it; choose the feeling that most drew your attention; and (5) look toward tomorrow and turn your feelings and thoughts into a prayer. Close with the Lord's Prayer. The Examen has been much examined and adapted. One adaptation by Linn, Linn, and Linn (1994) is particularly helpful in family

and marital contexts. The authors encourage prayerful reflection on two questions, “for what moment today am I most grateful” and “for what moment am I least grateful,” and to then share reflections with each other.

Discernment of Spirits

Ignatius was just into his 1930s when he was recuperating from the cannonball wounds at the Loyola castle. He needed to choose a life direction; was it a return to the knightly and chivalrous life or a move into the future following Christ? Which king or standard, Satan or Christ, was he to follow? During these and the following months, he developed the habit of attending to what was going on in his psyche, especially to the feelings that were evoked in response to his reading and reflection, in response to considering his desires. He became convinced that God was acting in his life; he tuned into God’s actions by listening to the movements of consolation and desolation in his heart. Ignatius developed his rules for discernment to help “people understand the typical patterns of compulsion and grace in their lives so that they are not unwitting victims of their own biases” (Dunne 1991). Discernment of spirits is a means by which persons determine their unique personal vocation; it is also a means by which persons deepen their faith and relationship with God. Discernment calls into question one’s image of God, taking of responsibility and freedom of choice. For Ignatius God was clearly loving and generous, available and self-giving; relationship with God called forth Discernment can be either a personal or communal process. Discernment requires humility, openness/detachment, love, and courage. In the *Spiritual Exercises* Ignatius detailed his “Rules for Discernment of Spirits.”

Ignatius of Loyola continues to have a powerful influence on contemporary spirituality 450 years after he lived. His *Spiritual Exercises*, rules for discernment of spirits, and use of the Examen continue to be valuable guides for many on the spiritual journey today.

Imagination

Dan Haldeman
Department of Integral-Transpersonal
Psychology, California Institute of Integral
Studies, San Francisco, CA, USA

Introduction

Imagination always infers perception (Aristotle, Book II). Aristotle’s opening quote points to one view for imagination, and it is from perception and its mechanics that this investigation into the state of imagination commences hoping to become less imaginary about perception.

Historical Views

Greek philosophers perceived imagination, or *phantasia*, as a filter that directly affected/

changed perception (Caston 1996). This suspicion/mistrust of imagination has historically led Western philosophers to construe it as: "...something different from the mind" (Cohoe 1996/2016, p. 321). The nature of this *something different* was written about by both Aristotle and Plato as, "causally derives from sensation, and its character derives from the character of that sensation" (Ibid, p. 328). Linking imagination to perception, sensation, and character reflects on how early Greek philosophers framed human psychology and imagination's influence on human nature. Scheiter (2012) notes that "phantasia is one of the most important pieces of Aristotle's psychology" (p. 1).

Roman philosophers/thinkers noted that imagination was one of the key components in successful oratory (Cicero, 106–43 B.C.E.), and later the poet Dante (1265–1321) reaffirmed Cicero's notion of imagination as a source for creativity (Flory 1996). This notion of imagination as a source for creativity can also be seen in the Enlightenment philosophy of Emmanuel Kant (1724–1804) who wrote that imagination helps create our phenomenal experience of the world by contributing to the knowledge base for mental structures and can also open new pathways of thinking making creativity possible (Ibid, 1996).

British Romanticist philosophers, writers/thinkers carried forward with the Roman notion of imagination as the basis for creativity, as evidenced in the writings of John Milton (1608–1671), Alexander Pope (1688–1719), and later the eighteenth-century writer Alexander Gerard (1774) claimed that, "it is imagination that produces genius" (Ibid, p.15). Samuel Taylor Coleridge (1817) writing about Aristotle's notion of *phantasia* framed this as, "... the primary imagination is the living power and prime agent of all human perception" (Watson 1975, p. 1).

Modern philosophies on imagination are reflective of this romantic notion of imagination being the source for creativity. John Paul Sartre' (1905–1980) envisioned imagination as relating to freedom in that freedom is an ability to negate reality which is what imagination produces: replacing reality with images (Sartre' 1940). French philosophers during the modern era were

also greatly influenced by an earlier proclamation from Rene' Descartes (1657), "I think therefore I am," a philosophy that has also been linked to the Aristotelian notion of imagination: "conscious thinking consists largely/entirely in a succession of mental images that are products of imagination" (Damasio 1994, c.f. Thomas 2003, p. 1).

Early Christian philosophers, e.g., Augustine (354–78 B.C.E.), framed imagination not only as a source for creativity, but also error, sin, and illusion (Flory 1996). This basic theological suspicion of imagination is based upon the Aristotelian and Platonic beliefs that imagination, being sourced from sense perception, therefore a material phenomenon, cannot be trusted as a lense for perception and needs to be regulated by mind (Kearney 1988). More contemporary theologians seem to be concerned with the relationship of faith and imagination to existence: "The task of imagination is to imagine the real" (Lynch 1973); Boff (1979): "creative imagination enables us to break away from things that are taken for granted, to abandon accepted presuppositions, and begin to think in unorthodox ways" (p. 96); McIntyre (1987): "imagination is the whole mind working in a certain way"(p. 170); Green (1989): "a preacher uses imagination to mediate and facilitate the congregation's experience of scripture and the Holy Spirit while mitigating existing world-views among the faithful"(p. 148); Boyd (1998): "the work of imagination is too see literature as an imitation/miming of human life" (p. 180). Noted contemporary theologian Paul Tillich framed imagination through a lens of religious symbolism based in *scriptural imagination* that he describes as an *integrative tool* for religious symbols. In order to guard against *idolatry*, Tillich suggested a dominate role for reason over imagination (Robinson 2000).

Psychological Connections

Returning to Aristotle's opening quote, "Imagination infers perception," Scheifer (2000) sees as a framing for human psychology. From a psychological perspective, it is evident that Aristotle's mistrust of imagination has carried through

psychological philosophy as well as theological philosophy. Rodney Collin Smith (1958/1976), a British psychologist turned Catholic priest wrote: “Remember that there are two kinds of imagination: to imagine what is false to be true, but also to imagine what is true to be false” (p. 36). Damasio (1994) framed cognitive functioning as a resultant of the steady stream of mental images proceeding through conscious thinking and asked the question, “do humans have any thoughts that are not the product of mental images” (p. 1)? Ouspensky (1957): “Imagination is not conscious/intentional thinking on some subject or visualization of some thing; imagination turns without any control and without any result” (p. 7); and, “By imagination I don’t mean daydreaming; I mean rather, imaging things that do not exist either in oneself or in other people” (p. 357).

Hunt (1995): Jung’s *archetypal imagination* illuminates the inner processes of an “adult spiritual intelligence” (p. 120). Edmundson (2012): “Yet I persist in thinking that a map of inner life that doesn’t pay attention to the imagination isn’t much of a map” (p. 150). Jung’s *active imagination* is a dialectical interaction between consciousness and the unconscious” (Kast 2014, p. 685). And finally: “Imagination can take three forms: passive, expressing itself in talk, expressing itself in activity” (Ouspensky 1957, p. 371).

Immanence is the experience of the divine as within and among us. The immanence of the divine within the natural world is often found in pantheism. Indeed many forms of pantheism equate the totality of the natural world with the divine. The term “divine” will be used because the doctrine of immanence is found in both theistic and nontheistic forms of spiritual world views. It is dialectically linked to the term transcendence and they constitute a primal contrast in the philosophy of religion. In the psychology of religion, the same dichotomy is conceptualized as the difference between self and other. In theistic spirituality the relationship between humans and God or the forms of the divine is a relationship between

persons. Buber (1958) conceptualized all relationships as either I/It or I/Thou, either instrumental or fundamentally personal and mutual in its very constitution.

In this context, immanence refers to the experienced presence of the divine within the mundane world and transcendence as the experience of the ultimate “alterity” or the divine as other. In transcendence, we experience of the divine as more than us, something beyond our capacities and knowledge. In immanence, we can experience the divine as a continuous background presence or as a specific epiphany, a concrete manifestation limited in space and time.

An alternative experience is the absence of the divine, a void. Emptiness can be nihilistic, a cold material world decayed into the completely random state of total entropy, which is the ultimate end of the universe in physics taken in context of materialistic monism as an ontological position. But emptiness can also be experienced as fruition and completeness. This is at the heart of Madhyamaka Buddhism, which is the experience of total emptiness as enlightenment, completely nondual being. Nagarjuna, the late Indian Buddhist sage, and a key figure in Tibetan Buddhism, is the clearest exponent of this position.

The presence of the divine within us can be seen as the source of all spiritual experience, a recognition of self by self. It was first seen in the myth of Narcissus, self-compounded by recognition of self. But the magic of spiritual experience is to shuttle the immanence and transcendence of the divine. This is the basis for not only the fear and trembling in awe in the presence of the mysterious and totally other; it is also the source of the experience of warmth and loving presence at the other end of the spectrum of spiritual experiences. Whether in joyous ecstasy or through the dark night of the soul, we shuttle between the experiences of immanence, transcendence, and emptiness.

Immortality

Morgan Stebbins

Faculty of the New York C.G. Jung Foundation,
New York, NY, USA

Human beings, as far as we know, are unique in the ability to understand that each one of us will die at some point. Although we are forever on this side of the “undiscovered country/from whose bourn no traveler returns” (Shakespeare, *Hamlet*, Act III, scene 1), this other type of time or place has been a concern of philosophy and religion from very close to the beginning of human history. Anthropologists consider the transition from living to nonliving to cause a basic cognitive dissonance so extreme that the nascent Neolithic consciousness as well as modern humans are incapable of making sense of it. In the ancient caves of Lascaux and Trois Freres, we see what may be indications of shamanic transformations – the precursors of conceptions of the soul and the beginning of the idea that there might be something more at the end of life than merely stoppage. Funereal remains have also been uncovered from this same period in the Neolithic age, suggesting a conception of something going on after the death of the body. This is developed a bit more in *The Epic of Gilgamesh*, which contains a section in which the hero-king Gilgamesh searches for the herb of immortality. He is tricked by a snake, however, and misses his chance. In this very early (twenty-second century BCE) epic poem, we see an approach to the afterlife that has already gained some momentum.

Not far away in Egypt, there developed perhaps the most highly differentiated conception of

multiple souls, their judgment and fate, and the proper internment of the body – at least for the Pharaoh, found in the ancient world. It seems that the common person did not have access to the soul nor of course to much in the way of a pyramid-like tomb in which to transition. This would have to wait for religions of the masses, such as Christianity in the West and Buddhism in the East. The Pharaoh's body was preserved so that he himself might have real existence in the Otherworld of the Celestial regions, and in various texts, we can trace a variety of beliefs regarding the manner in which he was supposed to reach the sky. Some early and late texts told of a ladder similar to that which Jacob saw in his dream – “a ladder set up on the earth, and the top of it reached to Heaven and behold the angels of God ascending and descending on it” (Genesis 28:12). In both of these examples, there is the sense that something beyond the body must exist – what we understand psychologically as the psyche – and that there is a veritable hierarchy of unconscious states which are only dimly perceived as instincts, urges, muses, ragings, and all the other demonic or divine possessions to which humans are susceptible.

Another version of immortality is fame, as defined by the story of Achilles. It was prophesied, according to his mother, that he could either have eternal fame and a short life or a long life, children, satisfaction, and perhaps just a few generations of being remembered by his children. Ovid wrote that although “his ashes would hardly fill an urn,” he fared better because “his fame now fills the world.” Although Ovid states clearly that “fame makes the man,” there is a later scene in which Odysseus finds him in Hades and tells him there is no man more blessed. To this Achilles responds, “By god I'd rather slave to another man on earth than rule down here over all the breathless dead” (Ovid, 12, pp. 615–619). This episode shows the social value (perhaps the ideology) of the concept of immortality and the ways in which it can form behavior.

Of particular interest just after the era defined by Gilgamesh are the mystery religions and their role in the development of the concept of the soul and its eternal or immortal destination. The

Eleusinian Mysteries are believed to have begun about 1600 BCE. This Mycenaean age was marked by a new turmoil about the fate of the soul. Before this, in most Western traditions, the soul just went to the place of the shades or went with the ancestors, whereas suddenly a level of doubt about what happens after death ran through the Mediterranean world. The Mysteries were intended *to elevate man above the human sphere into the divine and to assure his redemption by making him a god and so conferring immortality upon him* (Nilsson 1947, pp. 42–64). Of course the mysteries were only for the upper classes who could afford to travel to Eleusis and pay the high fees of the priests. In periods of cultural transition, there is often a deep rearrangement of core unconscious values. These values, as well as the symbols which can translate and contain them, are often communicated through metaphysical assumptions. When the anxiety about mortality and the soul reached the general public (exacerbated by the relativization of local ancestor cults by the religion of the Emperor), a new solution was needed of a more global scope. This is, psychologically, the explanation for the advent of the Christian symbol system.

A completely different form of literal, bodily immortality was posited and pursued almost contemporaneously by Taoist sages and medieval alchemists (Wilhelm 1962 or Dorn, etc.). For both the Taoists and the alchemists, it was thought that the correct bodily nutrients along with a state of mind that corresponds to the way (or Tao) would lead to endless life. In both cases the search was for the *elixir vitae* or potion of life. In fact, the elixir is a concept of great breadth. It is found in Arabic texts where it is referred to as the *elixir of immortality* or *Dancing Water* (in Persian, *Aab-e-Hayat*). The elixir is sometimes equated with the alchemist's philosopher's stone. As well, it can be found in the myths of Enoch, Thoth, and of course Hermes Trismegistus (Thrice-blessed Hermes). In all of the myths, the hero has drunk “the white drops” (liquid gold) and thus achieved immortality. We can even find a reference in the Qur'an (Sura 18; the Khidr), and it is mentioned as well in one of the Nag Hammadi texts. In all of these references, we can derive a psychological image

of how a particular relationship with the physical world could lead to a very different experience of temporality.

We can see similar attempts in the efforts of the believers in cryogenic research and other futurist enterprises. Indeed some very simple organisms do live in a kind of immortal existence in that they don't die unless killed, and the futurist community believes this may be possible in relatively near future. Of course millennial groups have always thought that the end time, or better, the end of time, was impending. If it were not, let's say it was predicted in a few 100 years, then it would have very little personal urgency. This urgency is an important psychological mechanism, since the degree of urgency is what motivates change, and change, as we have seen, is behind the image of rebirth.

The state of immortality, being the province of the gods and divine beings of many sorts, would seem to be desirable – especially if we factor in the “good” immortality conferred by the reward of going to Heaven. However, thinkers of many types have posited that human mortality is critical to development. Jorge Luis Borges explored the idea that life gets its meaning from death in the short story “The Immortal,” and Ernst Becker, in *The Denial of Death*, explains that a lack of grappling with the fact of death leads to neuroses of different kinds (Becker 1997). Instead, a confrontation with limitation, especially the limitation represented by the barrier of death, leads to a grounded personality and frees the creative potential which can be thought of as a playful interweaving of elements within a given structure or set of limitations.

In most religious traditions (especially the monistic ones), the status of immortality is confined to heavenly beings and of course the soul. However, depending on whether one (or rather, one's soul) ends up in heaven or hell, immortality can be experienced as either bad or good. Indeed in these traditions, there is often an idea of some sort of eternal reward or punishment. It's not hard to see the anthropological view of this as a coercive social mechanism, but again that tells us little about why it comes about in this form. We can therefore translate the form of this very widespread belief as an intuitive experience of

something *other* than normal consciousness, especially in terms of temporality. Wittgenstein may have been referring to this, saying in the *Tractatus*, “If we take eternity to mean not infinite temporal duration but timelessness, then eternal life belongs to those who live in the present” (Wittgenstein: 6.4311). Psychologically this points to the a-temporal and synchronous aspect of the psyche which does not conform to the rules of efficient or necessary causation nor to the usual rules of the time-space continuum (see especially Jung 1973).

One of the most perplexing types of immortality is that defined by metempsychosis or the dynamic of the soul's reemergence in a new body life after life. In both the Hindu and Buddhist (and Jain) forms, life is seen as negative, the realm of *samsara* or illusion and suffering, and the goal is to end the round of rebirth through extinguishment (that being the literal translation of *nirvana* – a blowing out of the flame of life), or for the Hindu tradition, *moksha*, a liberation which ends individual existence. One of the most sustained and beautiful contemplation of the nature of time and being is found in the Japanese Buddhist monk Dogen Kigen's work *Uji*, written in the thirteenth century (found in lots of places, but a nice scholarly work is by Heine 2006, p. 56). Although it would be ridiculous to paraphrase it, he pushes the understanding of time and timelessness to a point and with a subtlety perhaps still not excelled. These religious conceptions of rebirth can be translated as the experiential understanding that after major change we are, in fact, a different person: there is a discontinuity with the past when a major threshold is passed. Liberation is not very far from a psychological concept to start with, especially given that a subject's reconnection with the numinous core of a given collective symbol set relativizes the personal ego and also frees the subject from ideology.

Inanna/Ishtar

David A. Leeming

University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

The Sumerian goddess Inanna, whose Babylonian name was Ishtar, was probably the most important of Mesopotamian goddesses. The stories we have of her date to at least as early as the third millennium BCE. Uruk was her primary city. There she was "Lady of the Date Clusters," a title suggesting her role as fertility figure. It is clear, however, that she was more a goddess of sex, love, and war than a "great mother" nurturer. As "mistress of the *me*," the *me* being the essential laws and offices of civilization – kingship, godship, sexual practices, marriage, and political power – Inanna was the equal of the great male deities of the Sumerian pantheon. In fact, her primary title was "Queen of Heaven."

Inanna's consort and lover was Dumuzi, the shepherd. Inanna, as the goddess of love and fertility, calls on Dumuzi in love songs central to the Mesopotamian ritual of the sacred marriage, words which, though more sexually explicit, remind us of the love poetry of the biblical *Song of Songs*. Inanna urges her lover to fill her with his love: "My vulva, the horn, the boat of heaven, is full of eagerness like the young moon. My untilled land lies fallow."

The most famous myth about Inanna is that of her descent to the underworld ruled by her sister, Ereshkigal. This aspect of her story calls to mind the archetype of the descent so common in the hero myth. Like the myths of such figure as the Greek Persephone, the Egyptian Isis and Osiris, and Jesus, it involves the great themes of sacrifice and resurrection and power gained from the perilous descent into the world of death. There is also in Inanna's descent an implicit agricultural element involving "planting" under the earth and ultimately productive decomposition.

The descent myths tell how as Queen of the Above, Inanna, longed to know the World of the Below of her sister Ereshkigal. Inanna knows life fully, but she knows nothing of infertility and death. Before leaving for the underworld, Inanna instructs her faithful helper Ninshubur to arrange official mourning for her and to approach the other great deities for help if she should fail to return. Leaving her lover Dumuzi as king, she clothes herself in the sacred *me*, which take the form of seven pieces of magnificent clothing and jewelry, and in this state of great pride, she knocks on the gates of her sister's domain demanding admittance. Neti, the guardian of the gates, informs the naked Ereshkigal of the imposing and prideful visitor decked in the seven *me*. Furious at the intrusion, Ereshkigal allows Inanna through the seven locked gates of her realm but only if she gives up one of the seven objects (the *me* as ornaments and clothing) at each gate. Inanna agrees and, as a result, when she arrives at her sister's throne, she is as naked as her host and is thus effectively stripped of her great earthly powers. Such powers are, of course, useless in death. When Inanna attempts to usurp her sister's throne, she is condemned to death by the underworld judging gods, the Anunnaki. Inanna in fact dies and is hung up on a wall like a piece of meat.

Back in Uruk, the "real" world, 3 days and nights have passed, and Ninshubur follows her mistress's orders, declaring a period of deep mourning and asking the gods Enlil and Nannu for help. Both deities refuse, blaming Inanna for arrogance of her decision to attempt sovereignty over the underworld. Only Enki, the wise shamanic god, who from his home in the

underground waters of the *abzu* has his ear to the underworld, agrees to help. Enki understands how negatively Inanna's absence is affecting the world, depriving it, in fact, of its source of fertility. From the mud under his fingernails, Enki creates two creatures without gender, creatures which will not offend the infertile underworld, where Ereshkigal is howling in pain as she gives negative birth, perhaps to the stillborn of the earth. Enki gives the Plant of Life and the Water of Life to the two sexless creatures and instructs them to comfort Ereshkigal. When Ereshkigal offers the creatures gifts for having brought her relief from her suffering, they demand the body of Inanna, as instructed beforehand by the clever Enki. They revive the body with the Plant and Water of Life. But the Anunnaki demand a substitute for the revived Inanna. The goddess departs from her sister's land, gathering up her clothing – her old *me* and power. Entering her own world after 3 days in death, she is once more the glorious Queen of Heaven. But she is accompanied by demons whose job is to ensure the payment of the sacrificial substitute. When the great goddess and her underworld demons arrive at Uruk, a cheerful, well-dressed Dumuzi is acting as king, apparently having forgotten his once-beloved wife. Inanna, enraged by his attitude, offers him to the demons. Terrified, Dumuzi begs for help from the gods, but even when he is turned by the sun god into a snake, he cannot escape. Dumuzi is taken away, but his sister Gestinanna arranges to spend 6 months of the year in the underworld so that he can spend those months back in the world above. This detail reminds us of the arrangements made for the ravished Persephone in the Greek myth. The 3 days in the world of death followed by resurrection reminds us of a similar pattern in the story of Jesus.

The psychological significance of the Inanna descent myth is suggested by Samuel Noah Kramer. Inanna lives in the world of consciousness, the world above, but she must retain contact with the dark world of the unconscious below: "Inanna must not forget her neglected, abandoned older 'sister' – that part of herself that is Ereshkigal" (Wolkstein and Kramer 1983, p. 161). In the same way, Kramer

suggests, Dumuzi, the sacrificial scapegoat, must experience the dark world of Inanna's other side, Ereshkigal, in order to become a "truly 'great' king" (Wolkstein and Kramer 1983, p. 163).

A dominant approach to the psychology of Inanna's descent has focused on the goddess as a representation of the psychic journey of women. In this paradigm the Inanna-Ereshkigal dichotomy represents the divided feminine and the struggle of women to achieve wholeness in a repressive male-dominated world. By descending to Ereshkigal, the woman experiences her repressed side and returns to the conscious world above with some of her dark sister's power. Others, while not disagreeing with this analysis, stress the fact that most heroes, male and female, must confront the "dark side" in order to achieve the goal of wholeness. In this sense, Ereshkigal is the unconscious hidden and repressed self which needs to be integrated with the conscious self which is Inanna. In descending into the dark world of the unconscious, Inanna must surrender the elements of her authority and personal power, her accepted assumptions about herself. This denuding represents what for anyone is the dangerous and difficult psychological process of self-examination and psychological growth, the willingness to die to the old life to be born into the new. After fully experiencing the world of what Jung would call her shadow, Inanna returns to consciousness with some of her sister's knowledge. In this approach, Inanna stands for all of us who explore the unconscious in order to integrate it with consciousness.

Incarnation

Charlene P. E. Burns

Department of Philosophy and Religious Studies,
University of Wisconsin-Eau Claire, Eau Claire,
WI, USA

Literally, the act of being “made flesh”; the earliest and most common usage is in reference to the Christian doctrine about the divine nature of Jesus.

Historical Overview

Belief that the divine manifests in human form is as old and diverse as religion itself. Cave art from the late Paleolithic Age depicts masked figures thought to represent the divine animal spirit; sacred heavenly visitors are portrayed in the art of premodern societies. Many Native American religions teach that souls of the dead return to earth in human or animal form and also that the divine incarnates itself from time to time. Some Australian indigenous peoples teach that the human has two souls: one mortal and the other immortal and believed to be a particle of the totemic ancestral beginnings.

Ancient Greek Gnostics believed that the human being is a duality of material body and immortal soul. The souls turned away from contemplation of the One and fell from the divine realm to be incarnated and imprisoned in the

body. These ideas combined with the mythologies of Olympus which told of the gods’ interaction with humanity, very often taking on human or quasi-human form. Pythagoras, Empedocles, and Plato, for example, taught that the immortal soul sinned, fell from an original blissful state, and suffered repeated incarnations until achieving spiritual restoration to bliss. Pythagoras and Plato were themselves thought to have been gods made incarnate.

Several centuries before the Common Era, the ancient Persians believed that Mithra, the God of light, would incarnate at the end of history. Mithra would be a universal king and savior, God born of a woman. Human kings were believed to be the divine Horus in ancient Egypt. In China it was taught that the emperor, as Son of Heaven, was the representative of Heaven on earth. Since the inception of Buddhism in China, emperors have from time to time been believed to be incarnations of the Buddha, and for the ancient Japanese, the emperor was *akitsumi kami*, god manifested in human form (Waida 1987).

Among present-day religions, in the avatar of Hinduism, we find what may well be the oldest clearly developed exposition of divine incarnation. In its earliest form, divine descent in Hindu thought was described as *pradūrbhāva*, manifestation. By the fourth century, before the Common Era, the term *avatar*, from the words meaning “to cross over” and “down,” had come into usage, primarily in relation to the earthly presence of the preserver god Vishnu (Parrinder 1982). In the Bhagavad Gita, Krishna, an avatar of Vishnu, says, “To protect men of virtue and destroy men who do evil, to set the standard of sacred duty, I appear in age after age” (*Bhagavad Gita* 1986, 4, pp. 6–8).

In some forms of Buddhism, emphasis has shifted away from the historical Buddha to the Eternal Buddha, a transcendent being said to embody universal truth. The Mahayana Buddhist doctrine of Trikāya, the “three bodies,” teaches that the Buddha is known as *dharmakaya*, True Body (the essential Buddha who is ultimate reality independent of all and yet the “thatness” of all), *nirmanakaya* (Body of Transformation, that by which the earthly historical Buddha was enabled

to work the good), and *sambogakaya* (the Body of Bliss or celestial Buddhas and bodhisattvas, those who have attained enlightenment but choose to return to earth to help others reach *nirvana*) (Gard 1963). In Japanese Buddhism, the doctrine is further developed into a cosmic theism wherein creation is believed to be the embodiment of the Buddha Mahavairocana. This cosmic figure is both immanent, through embodiment of himself in the six constitutive elements of the universe – earth, water, fire, wind, space, and mind – and transcendent, absolute, eternal (Waida 1987).

It is widely held that Judaism is adamantly non-incarnational and yet according to some mainstream Jewish scholarship, the texts of normative Judaism present God in terms of incarnation and that in fact, incarnation as a concept is integral to Hebrew Scripture (Neusner 1988; Wyschograd 1996). Even in Islam, which is a faith based firmly in insistence on the absolute unity of God, there are sects that teach something very like incarnation. Although for the majority of Muslims the idea of incarnation is the greatest form of sin, some Shi'a believe the Imam was the actual embodiment of the divine light. For the Druze of Lebanon, for example, the Imam has been said to be the literal incarnation of God on earth (Martin 1982; Parrinder 1982; Waida 1987).

Psychological Interpretations

Given the nature of the claim, the idea of divine incarnation is not subject to experimental or laboratory examination. It can be addressed, however, from the psychoanalytic point of view. Strictly Freudian approaches tend toward explanatory claims, whereas other depth psychological approaches attempt to address the question from a functional point of view.

For Freud, religion and all its expressions are infantile regressive defenses. He believed that Christianity is an especially clear manifestation of dynamics at work in the Oedipal complex. The longing to eliminate the father and take possession of the mother is, in a sense, the original sin which gives rise to the guilt from which we must

be redeemed. Christ, as both Son of God and God Incarnate, atones for us through his own death. Freud's focus in his writings on Christianity was primarily on the meaning of the Eucharist (as symbolic and defensive reenactment of the Oedipal wish to both eliminate and identify with the father), but it can be inferred that the idea of incarnation is an expression of the infantile wish to become the father.

Early in his career, Carl Jung accepted Freud's stance that religion expresses infantile wishes, but as his own understanding of the self evolved, he came to see religion in a more positive light. Writing about the Christian doctrine of the Trinity, Jung (1948) suggests that this symbol is an expression of individual psychological maturation. The Father symbolizes the original state of unreflective acceptance similar to the way we function in childhood. The Father gives birth to the Son, which correlates to growth in discrimination and differentiation from parents, and the Spirit corresponds to a new level of consciousness involving the mature incorporation of the unconscious and discriminatory aspects. In one of his most controversial works, *Answer to Job*, Jung expands this thesis and interprets the idea of Jesus as God incarnate as a manifestation of evolution of the God-image. Cautioning that "the image [of God] and the statement [about God] are psychic processes which are different from their transcendental object; they do not posit it, they merely point to it," Jung argued there that the book of Job tells the story of God coming to consciousness through encounter with Job (1976, p. 556). In the story, God is capricious and jealous, allowing Satan to torment Job without justification. Job remains steadfast in spite of his suffering, and in the end God, not Job, is changed. Remembering that for Jung religious ideas are symbolic expression of aspects of the human psyche, we see that the incarnation of God in the human Jesus is the necessary next step in evolution of the Western God-image. God must become human in order to atone for the wrongs committed against humanity; expressed in psychological terms, the appearance of the symbol of God incarnate reveals the maturation of Western humanity's internalized image of God. The

fact that we find incarnation in many religions demonstrates, for Jung, the universality of the God-image archetype.

In object relations and self psychologies, religion is a potentially positive expression of human psychic experience. It can promote wholeness through enhanced object relations and/or provide a bridge between inner psychic and outer social experience. Although the idea of divine incarnation tends not to be directly addressed by psychoanalysts in these schools of thought, the ubiquitous nature of the idea lends support to the thesis that narcissism is basic to human psychological development. For self psychologies, narcissistic libido is a basic energy that functions in the cathexis of objects felt to be a part of ones' self (selfobjects). The challenge of psychological maturation involves redirection and integration of narcissistic cathexes. The God-image, one of the most important selfobjects, is derived from early parent/caregiver relations and changes over time (Rizzuto 1979). Conceptions of divine incarnation, then, may be said to be manifestations of the tension between narcissism and internal object relations.

Theology and Psychology

Some theologians with expertise in psychology have made interesting use of these theories to develop a range of new understandings of the doctrine that incorporate explanatory and functional aspects of interpretation. C. Burns (2001) interprets incarnation in terms of the human capacity for intersubjectivity made possible by the innate processes of empathy, sympathy, attunement, and entrainment. In a more classic psychoanalytic mode, J. Moltmann (1973) interprets the powerlessness of the crucified God incarnate as a counter to the Oedipal father imagery of the Hebrew Bible. The image of God crucified opens us to the depths of our own humanity and prepares us to accept the moral responsibility that accompanies freedom of the will. H. Heimbrock (1977) expands on Moltmann's thesis to include the claim that the death of God incarnate on the

cross signifies renunciation of the grandiose self which leads to transformation of narcissistic fantasies.

Indian Pilgrimage

Raeesabegam Usmani

Department of English, Veer Narmad South
Gujarat University, Surat, Gujarat, India

Travel for the sake of the experience, created by the travel itself – historically known as pilgrimage – remain a popular and even increasing form of travel. (Valsiner 2012)

Pilgrimage is an ancient form of travel (Valsiner 2012). Pilgrimage has always been counted as the most common reasons of travelling among all the other reasons since antiquity around the world. The words “pilgrim” and “pilgrimage” have been carrying number of meanings since ages. The English term “pilgrim” originally comes from the Latin word peregrines, which means “a foreigner, a stranger, someone on a journey, or a temporary resident.” It describes traveler who is making brief journey to particular place, or someone staying on for short or long period in a foreign land. *Peregrinatio* was the state of being or living abroad (“pilgrims”). The study done by Stockholm University in 2011, on why people does pilgrimage, declares that, pilgrims visit the Holy Land to touch and see the physical manifestation of their faith, to connect personally to the Holy land, and to conform their beliefs in the holy context to collective excitation (“Pilgrimage”).

Pilgrimages are self-commenced expeditions undertaken by the pilgrims to distant places and

entities of exceptional peculiar and societal significance where this journey becomes vital. The adversities and troubles encountered by the pilgrim en route to their destination are not trivial displeasures to bypass. They, however, instead prepare the traveler for individual and collective transformation as anticipated from a pilgrim (Valsiner 2012).

Pilgrimage is lengthy and time-consuming journey. It is also undertaken as an exploration of virtuous holy places or revered shrines of great importance by the followers of respective religions and sects. It is an expedition leading to the divine abode or the sanctuary of prominence to one’s values and conviction. Adherents of every single religion involve themselves in such journeys at least once in their lifetime. A person who gets on to such journey is known as a pilgrim.

Pilgrimage has usually been considered as a “religious journey.” It is associated with spiritual aims and accomplishments of the pilgrim (Valsiner 2012). Adherents observing diverse faiths around the world have religiously been instructed for embarking on the pilgrimage. The believers of respective religions have continuously been practicing these observances since centuries. India as a country ever celebrating the concept “unity in diversity” has also been housing numerous well-known pilgrimage sites since ages. These long-established and famous sites have been attracting throngs of national as well as international pilgrims from the time immemorial. People of diverse religion, ethnicity, and sect are living together since ages as an existing proof of the unity in diversity in India. Indians, like all the other civilizations around the world, too, have been performing pilgrimage since antiquity.

India is famous for its immense cultural heritage and countless religious pilgrimage sites of different faiths around the continent. For instance, in Hinduism, Vedas – Rig Veda and Atharva Veda – are believed to be the earliest sources offering information about the divine pilgrimage locations. After that, the tradition of going on pilgrimage became a common practice for the people of the ancient era, which has been continuing through ages until the date. One of the greatest Indian epics, *Mahabharata* (350 BC), records more

than 300 pilgrimage sites around the Indian sub-continent. Later, *Puranas*, which are sacred books of Hinduism, have added a few more locations in the existing list of the pilgrimage sites during the second to fifteenth centuries AD. Over the period, pilgrimage has become one of the vital conventional religious obedience. There are many religious locations including distinct religions and sects, which are worshipped by devotees as a center of their religious observances in India. Ajmer Sharif Dargah, Haji Ali Dargah, Hazratbal Shrine, Dargah of Nizamuddin Chishti, Bodh Gaya, Sarnath Kushinagar, Sanchi, Varanasi, Golden Temple, Patna Sahib, Anandpur Sahib, Nanded Sahib, Jain Pilgrimage sites (Hastinapur, Taxila, Humbaj, Palitana, Girnar, Kundalpur), eight Atash Behrams, St. Thomas Mount, Vaishno Devi, Tirupati Balaji, and Jagannath Puri are, for instance, a few to name certain celebrated sites. Around the first millennium BCE, Varanasi is believed to have appealed to throngs of pilgrims of Hindu and Buddhist religions alike.

The literature written on pilgrimage has been enriching Indian literature encompassing its diversity since ages through pilgrims, who were travelling and sharing their impressions ever since. These records have added significant information in the already existing literature on pilgrimage travel writing. The pilgrims have been sharing their experiences in different forms of literature such as poetry, song, travelogues, and guidebooks. More and more multicultural voices have been enriching literature, written on the pilgrimage.

Certain handful of accounts were penned in regional dialects too; for instance, Marathi saint Namdev had recorded his pilgrimage in his autobiographical poetry *Tirthayatra* which means “pilgrimage” in the fourteenth century. Jain holy men have documented their pilgrimages in the thirteenth and fourteenth centuries. Jain saint Ambadev penned *Samararasa* in 1314; a Maithili poet Vidyapati had written *Bhuparikrama* and *Kirtilata*. In addition, accounts such as *Raja Gagarirajko Yatra* were written in Nepali in 1493; Manikya Chandra Suri’s *Prithvicharita Aparnam “Vagvilas”* was written in Rajasthani in 1421; and Sangha Kalash’s *Samyaktavarasa* was written in the year 1448. The books authored by saint

Chaitanya in the fifteenth and sixteenth centuries and a pilgrimage account written in verse by a Bengali poet Bijoyram Sen entitled *Tirthmangal* (Happy Pilgrimage) in the year 1770, including a Manipuri account, depicting Bhagyachandra Maharaj’s pilgrimage to Ganga during 1801–1803, entitled *Chingthang Khomba Maharaj Ganga Chatpa*, are also significant records of the Indian pilgrimages (Bhardwaj 1983).

Unexplored lands and pilgrimage sites have been appealing curious and brave travelers since antiquity. Thus, only Indian but also foreign travelers have visited various religious places of India during the ancient and medieval era and noted down their impressions for the record. As Mark Twain has opined in his *The Innocents Abroad*:

Broad, wholesome, charitable views of men and women cannot be acquired by vegetating in one little corner of the earth all one’s lifetime. (*The Innocents Abroad*)

Hence, foreigners have visited India for numerous motives and intents such as merchants, pilgrims, and tourists, documenting their amazing impressions about this foreign land (for them) and its inhabitants. The earliest example of travelling between India and China was recorded somewhere around 150 CE, when Indian scholars went to China to participate in the first ever Center of Translating Buddhist sermons from Sanskrit into Chinese language in China (Bhardwaj 1983). Referring to certain celebrated among many foreigners accounts written on India are the books of Chinese travelers FaHien (c.337–424 CE), Hsuan-Tsang (602 AD–664 AD), and Yijing or I-tsing (635–713 CE), in addition to Muslim travelers named Al Beruni and Abu Fazl.

Hsuan-Tsang traveled to India as a pilgrim in 629 AD to 645 AD and documented his experiences. Al Beruni has penned famous account titled *Kitab-ul-Hind* offering his impressions of India in around 1030 AD, whereas Abu Fazl has written an interesting book *Ain-e-Akbari* in the late sixteenth century (Bhardwaj 1983). Today these accounts are celebrated as significant historical documents of that era on India. These travelers have minutely recorded their observations on the Hindu pilgrimage sites, besides remarking on life and people of that era.

Bhardwaj in his *Hindu Places of Pilgrimage in India: A Study in Cultural Geography* claims that Hsuan-Tsang's account is the "earliest foreign accounts of the institutions and places of pilgrimage in India." Hsuan-Tsang has chronicled the much popular observance of bathing, practiced by throngs of devoted pilgrims in the holy rivers, predominantly in the divine river Ganga. In addition, he remarked that the customary immersion of the remains of the dead body in the river by the relatives, precisely in the sacred Ganga, is a much revered and obligatory ritual of Hinduism, which has been practiced for ages that, as believed, ensures the salvation of the departed soul. Hence, Hsuan-Tsang mentioned his observations "on the merit of drowning in this river as well as the tradition of consigning the ashes of the dead to the Ganga" (Bhardwaj 1983). However, it is to be noted that Hsuan-Tsang was particularly concerned with Buddhism; yet he could not resist to observing Hindu pilgrims and pilgrimage sites en route. His observations on Buddhism are also critical documents of the ancient times.

One distinguishing feature to bring together diverse forms of journey to faraway lands is the instinct aspiration of a traveler for transformation. Individuals embark on various travels or perform pilgrimages with the purpose of consequential conversion leading to the insightful conducts. The direct object of the change is recurrently one's own self (Valsiner 2012). Thus, pilgrimages bring spiritual as well as psychological transformation in the pilgrim.

Humbleness, devotion, offerings, and donations turn out to be of a significant merit for a lot of pilgrimages. Since, those travel to distant lands from homeland to influential spaces of their faith, where they essentially remain dependent on the compassion of people as a part of their confronting, revered entities of their religion. Therefore, Pilgrimages turn out to be the facilitator for reforming pilgrim's moral system. Fundamentally, it is expected that the pilgrim returning back from those distant lands after fulfilling holy rites will return with the significant transformation in the spiritual and psychological realms. The pilgrim should not just then return with the unknown tales and legends, relics, and photographs of the places visited but, in addition, should also bring less

perceptible but noteworthy emotion that transforms their key bond with the humankind (Valsiner 2012).

Indigenous Religions

Kenneth H. Lokensgard¹ and Alexander (Alejandro) V. Gonzalez²

¹The Department of Religious Studies, University of North Carolina-Chapel Hill, Chapel Hill, NC, USA

²Strayer University, Piscataway, NJ, USA

Indigenous religions are the ancestral religions of peoples who are native to particular landscapes. Their religions help them achieve the goal of living successfully in those places. Thus, indigenous religions vary, just as the places their practitioners inhabit vary. Yet, the many religions practiced by indigenous peoples share common themes. These themes include emphases upon

relationship and place. The practicing psychologist or scholar of psychology and religion should pay close attention to manifestations and implications of these themes, as they are the basis of behavior and identity among indigenous peoples.

While a strong thread of tradition runs through most indigenous religions, colonized, often-relocated peoples have had to adapt, borrow, or even establish new religious practices to live in new cultural and/or geographic environments. When the “newness” of these religions is particularly evident, we refer to them as “indigenized” religions. These religions also often fall into well-known categories such as “new religious movements” and “pan-cultural movements.”

Indigenous peoples who continue to practice contemporary versions of their ancestral religions typically view their landscapes as animate. The animate aspects of their environments include things that nonindigenous people do not consider alive. Moreover, all of these living things possess a potential for personhood. That is, they can interact with and lend aid to humans, if treated respectfully and generously. Therefore, an ethic of reciprocity is found across indigenous cultures (Harvey 2005; Lokensgard 2010b). This ethic is expressed in the social protocols and formal rituals performed by indigenous peoples. Thus, indigenous religions help human practitioners establish and maintain positive relations with other beings, including creator figures, who can aid humans in their quests for successful lives.

Of course, the other-than-human persons inhabiting the environments of indigenous peoples can reciprocate or even initiate poor treatment. Consequently, indigenous peoples must be mindful of their actions at all times. They must follow the ethic of reciprocity in every area of existence. Therefore, religious phenomena are not so easily distinguished in indigenous worlds from political phenomena, economic phenomena, and so on.

Scholars of the past often characterized indigenous religions as less evolved than others by labeling them “primitive” (Geertz 2004, pp. 46–52). One of the reasons they did so is that they misunderstood indigenous ontologies. When we take indigenous ontologies or classifications of

being and beings seriously, we understand that indigenous peoples truly understand the worlds around them as alive and personal; their worlds are not just metaphorically alive. This understanding often carries to their language, imagery, and material culture as well. They often consider words, pictures, and ceremonial items to embody other-than-human beings. These things are *not* simply symbolic of other beings.

Past scholars also viewed indigenous religions as primitive because indigenous peoples emphasize oral communication, rather than written. Certainly, some indigenous peoples possessed highly developed forms of pictorial communication before the introduction of abstract writing by colonizers. Yet, to this day, orality remains important. This is not only because there is vitality to language but also because language facilitates relationships between persons. Thus, it is used very, very carefully by indigenous peoples. Indeed, its misuse can offend others and jeopardize the relationships upon which indigenous peoples depend to live successful lives. Language, then, is thought of in much more complex ways that earlier scholars often understood. Indeed, among indigenous peoples, spoken language and other means of communication have the sort of value that only poets and other artists and intellectuals ascribe to them in nonindigenous societies.

By ignoring the inherent value of religious material culture, the physical world, and the truly effective power of language among indigenous peoples, past scholars often reduced the importance of indigenous religions to the psychological (Evans-Pritchard 1989, pp. 20–47). It is imperative, now, that professionals in the mental health field and scholars of psychology and religion, who work with indigenous peoples or even indigenized peoples, recognize that the external, physical, often personal world is of enormous importance to them as well. The lives of indigenous and many indigenized peoples are governed by the need to maintain proper relationships (Gonzalez 2010; Lokensgard 2010a). This simple fact means that psychologists and scholars must consider those things, beings, etc., to which indigenous peoples relate.

Just as personhood is determined by one's interactions and relationships with others, so is identity among indigenous peoples. For example, the Blackfoot Peoples of the northwest plains in the USA and Canada refer to themselves as the *Niitsitapiiksi* or "Real Persons." This name indicates that there is a behavioral dimension to their identity; they are the people who know how to interact with the beings around them *as* persons. This last point is key, as some conservative Blackfoot traditionalists argue that one can only be a "Real Person," if she or he remains in Blackfoot territory. In fact, Blackfoot warriors of the nineteenth century would consciously put aside their personhood and become "mad wolves," when they left their lands to raid (Lokensgard 2010a, pp. 78–82).

The Iroquois Peoples of the eastern USA and Canada refer to themselves as the *Haudenosaunee* or the "People of the Longhouse." Again, ontological status is indicated by this name, and the importance of place is explicit. The names of indigenous peoples as diverse as the *Ainu* of Japan and Russia, the *Yolgnu* of Australia, the *Bosotho* of southern Africa, and the *Yupit* of Alaska all emphasize personhood and, by extension, the behaviors that define personhood for these peoples. Names of other indigenous peoples simply emphasize place. Nevertheless, in all cases, a concern for relationship, expressed interpersonally or geographically, is implicit. This illustrates that identity, for most indigenous peoples, is based upon the notion of relationship.

As stated earlier, the social protocols and formal rituals of indigenous religions, though they manifest differently across cultures, help indigenous peoples maintain the relationships that are so important to them. The protocols and rituals always involve an expression of generosity, respect, or material gift giving. Sometimes all these things are expressed through bodily sacrifice. Such actions demonstrate that the practitioners of these religions embrace the ethic of reciprocity and that they are worthy of whatever help they may need from the other-than-human persons or the creator. These actions are also undertaken to give thanks for help already

received. If one takes the necessity of reciprocal behavior seriously, after all, then one lives a life marked by continual giving, receiving, and offering thanks.

Today, almost all indigenous peoples have been introduced to foreign religions, such as Christianity, through the process of colonialism. As a result, many contemporary indigenous peoples practice religions that were unknown to or even resisted by their ancestors. When embraced fully, the foreign religions represent a great departure from the ancestral religions, since the former are not place-based. Their efficacy is supposed to be universal, as they focus almost exclusively upon a figure who created all peoples. Moreover, these colonial religions, particularly certain forms of Protestant Christianity, place less emphasis on the consequences of one's actions upon the earthly, immediate relationships that help define one's life. Most nonindigenous people do not see their worlds as filled with life, let alone with other-than-human persons. So, for them, there are fewer relationships available. In their religious lives, they emphasize the relationship they have with their creator. Even this relationship is sometimes very abstract, since the creator is often viewed as transcendent.

Before continuing, it must be noted that many people, who are not of indigenous ancestry, find indigenous religions attractive. This is a new type of "primitivism," to be distinguished from the evolutionary primitivism of earlier scholars, discussed above. The new primitivism valorizes indigenous religions, but it is still a damaging phenomenon. Primitivists have appropriated indigenous ceremonial materials, imagery, and rituals. Not understanding the true importance of place and relationship in indigenous worldviews, they have misinterpreted these things and used them in social and geographic contexts in which they were never meant to be used. Moreover, some of the more enterprising primitivists have commoditized indigenous cultures, charging money for the ideas and items they have appropriated. One can easily see how such actions are offensive to indigenous peoples and even damaging to the relationships they maintain.

From a psychological perspective, however, the new appreciation of indigenous cultures is understandable. Many mainstream Americans, Europeans, and others are unhappy with the state of the world and blame technology, in its many forms, for the world's ills. They contend that technology limits our relations with other people and with the land, it damages the "natural" world, and so on. By embracing what they consider as the simpler, healthier, more community-oriented lives of indigenous peoples, they are protesting technological "progress." Ironically, the modern primitivists see indigenous peoples as existing at the other end of an evolutionary continuum, just as scholars of the past did (Geertz 2004). In reality, of course, most contemporary indigenous people embrace technology as strongly as anyone else does, and they suffer the negative effects of certain technologies as well.

Finally, there are those contemporary people of indigenous backgrounds who seek to live the spiritual views of their displaced ancestors. Many such peoples' concurrent beliefs include elements of both "indigenized" religions and Christianity. Notable among these religions are those collectively referred to as African diaspora religions. Primarily oral traditions, these religions involve a system of African spirituality that spread throughout the Americas as individuals from many distinct groups were forcibly brought to places such as Brazil, Cuba, Hispaniola, Trinidad, and the southern United States. In order to live successfully, which involved deriving meaning from their condition of slavery and surviving, slaves reimagined their African homeland in terms of the new geography. Exchanges among individuals with different tribal practices and contact with local indigenous practices and European beliefs, as well as geographical adaptations that substituted the new fauna (such as the Cuban *hutia* for the African *aguti*) and flora for that found in the African homeland, led to the indigenization of these African beliefs and practices.

These practices evolved with the slaves' descendents, and contacts and adaptations had a specific locus relative to the landscape in which they took place, but all maintained a congruent

African spiritual orientation to reality that remains evident today. This spirituality is one where a primal force holds the cosmos in balance and animates all things; a supreme but aloof being is above a pantheon of semi-divinities; semi-divinities interact with humans; ancestor veneration is coequal with the semi-divinities; animal sacrifice, herbal preparations, and foods are utilized for divine protection, to elicit a boon, or to appease a semi-divinity or an ancestor; rites of passage are emphasized; and consecrated drums are used to invite spirits and divinities to possess followers (Gonzalez 2010).

In African-derived religions, just as in traditional indigenous religions, religious practices are not compartmentalized from other practices, nor is the "spiritual" readily distinguished from the material world. An instance of this non-compartmentalization is the *Yorùbá-Lukumí* oracular tradition, where all aspects of a person's life are important and where the material can cause a spiritual imbalance and vice versa. Additionally, because of their animistic base, African-derived religions do not proscribe belief or practice in other spiritualities. The ancestors must be appeased, as they can offer guidance, but they can also cause a spiritual imbalance, as is the case in Cuban *Yorùbá-Lukumí*. Spirits can also, for better or worse, become attached to an individual. Or spirits can inhabit an artifact that takes on personhood, as with the *gnanga* caldron, which is a receptacle for a deceased spirit and *Bantu nkisi*, in the Cuban *Palo Mayombe*. Often we see a pantheon of semi-divinities, or divine spirits, who must be cared for and demand action, such as the *orishas* in *Yorùbá Lukumí*, *orixás* in Brazilian *Candomblé*, and the *loas* of Haitian *Vodoun*. These semi-divinities, who are often other-than-human persons associated with "nature" or tribal/cultural heroes, can also possess the practitioner and offer guidance or demand an offering or that some action be taken.

Besides New World religious cross-fertilization among African tribal peoples, one can detect Christian, indigenous, Spiritist, and even Muslim elements. For example, Cuban *Lukumí*, and Brazilian *Candomblé* and *Ubanda* adapted the structure of Kardecian Spiritism as another way of communicating with the dead, spirit guides, and as a structure to

supplant *egungun* (death) rites lost with the Middle Passage. Ethnobotany, which can have both African and New World indigenous roots, is employed for both spiritual and physical healing, and as element to keeping the semi-divinities alive and happy, and is an important aspect of African and Diaspora spirituality. But spirits can be indigenous and non-African as in the case of the *caboclos* of Brazilian *Candomblé*, who possess practitioners, or spirits can become attached as in Cuban *Lukumi*. Here, then, one can see how indigenized religions might also be categorized as “pan-cultural,” that is, they often draw from a variety of cultures. Traditional indigenous religions, on the other hand, usually remain unique to the people who practice them.

Practitioners of traditional indigenous religions and newly indigenized religions alike, who are in need of medical or other special help, often rely first upon their own rituals and religious specialists, before approaching non-indigenous professionals. This may be an important point for practicing psychologists to remember. They should also remember that indigenous peoples, including those who come from displaced communities, often carry with them the legacy of colonialism. Even among the most traditional or dedicated of such individuals – those who continue to rely upon their ancestral traditions or even upon an indigenized version of those traditions – the impact of having been branded “primitive” or essentially less-evolved than members of the colonizing society can be tremendous. Of course, there are those many indigenous peoples who no longer practice *any* version of their traditions, precisely because those traditions were denigrated by outsiders. These people, who can no longer base their identities upon maintaining relationships with all the inhabitants of their ancestral environments, have to seek new identities. The practicing psychologist working with these people will have to deal with this fact. Likewise, the scholar of psychology and religion should pay close attention to the extent to which the people with whom she or he is working engage in their ancestor’s social protocols and rituals. If the scholar finds that they do so to a large extent,

then the scholar should open his or her mind to the fact that different ontologies are at work in indigenous and indigenized religions. Failure to do so will lead the scholars to overlook the importance of the external, physical, and very personal environments in which indigenous religions are practiced. Such failure will also prevent scholars from understanding the nature of identity among indigenous peoples, and the role that relationships play in those identities.

Individuation

Leon Schlamm

School of European Culture and Languages,
Religious Studies Section, University of Kent,
Canterbury, Kent, UK

Jung's Definition of Individuation

C. G. Jung defined individuation, the therapeutic goal of analytical psychology belonging to the second half of life, as the process by which a person becomes a psychological individual, a separate indivisible unity or whole, recognizing his innermost uniqueness, and he identified this process with becoming one's own *self* or *self*-realization, which he distinguished from "ego-centeredness" and individualism. The self, the totality of personality and archetype of order, is superordinate to the ego, embracing consciousness and the unconscious; as the center and circumference of the whole psyche, the self is our life's goal, the most complete expression of individuality (Jung 1916/1928, 1939a, 1944, 1947/1954, 1963). The aim of individuation, equated with the extension of consciousness and the development of personality, is to divest the self of its false wrappings of the persona, the mask the personality uses to confront the world, and the suggestive power of numinous unconscious contents. While individuation appears to be opposed to collective standards, it is not antagonistic to them, but only differently oriented and never isolated from collective relationships and society. Nevertheless, the stunting of individuation by the individual's adherence to social norms is injurious to his vitality and disastrous for his moral development (Jung 1921, 1916/1928).

The Spiritual Nature of the Individuation Process

In his later writings, Jung claimed that individuation is as much a spiritual as a psychological process, uniting instinctual with religious experience.

Affirming individuation to be the life in God, insisting that man is not whole without God, and identifying numinous symbols of the self with those of the deity, he conjoined psychological with spiritual development, frequently identifying the former with latter. By sacralizing psychology, as well as psychologizing religion, Jung's writings on individuation, celebrating the union of man and God and matter and spirit within human consciousness, anticipated a widespread contemporary movement away from traditional religion towards detraditionalized and privatized, New Age forms of spirituality recently examined by sociologists and historians of religion (Jung 1951, 1951–1961, 1952/1954, 1956–1957, 1963; Heelas 1996; Hanegraaff 1998; Tacey 2001, 2004; Forman 2004; Main 2004).

Individuation, closely associated by Jung with the transcendent function, is the "teleological" or "synthetic" healing process, underlying all psychic activity, of balancing, mediating, or uniting conflicting psychic opposites, which overcomes psychological disequilibrium and initiates the experience of "wholeness" of the personality. Distinguishing between a consciously realized individuation process and a natural one that runs its course unconsciously, Jung insisted that the former requires the difficult integration of projected, numinous, archetypal, unconscious contents – for example, the shadow, the anima/animus, the wise old man, and the self – into consciousness. Through this union of the opposites of consciousness and the unconscious, frequently triggered by Jung's dissociative technique of active imagination, the clarity of consciousness is intensified, a unity of being is realized and recognized as objective, the individual is freed from emotional attachments to the outer world, and the individuated ego is enriched by the understanding that it is not that something different is seen, but that one sees differently (Jung 1931/1962, 1939b, 1952/1954, 1963). The individuated ego senses itself as the object of an unknown and superordinate subject, the self, the God within us, which, while strange, is also so near to us, wholly ourselves while still an unknowable essence transcending our powers of comprehension. The function of the transcendental postulate of the self,

which Jung acknowledges does not allow of scientific proof, is to point to this experience of the incarnation of God in human consciousness, encountered so frequently in his empirical research (Jung 1916/1928, 1939b, 1963).

Synchronicity, *Unus Mundus*, and the Mandala

However, one should not conclude, as many of his critics have, that individuation was understood by Jung to be a wholly intrapsychic experience divorced from the world and human relationships. His metapsychological concept of individuation was gradually broadened and enriched by his theory of synchronicity, identifying experiences of meaningful, numinous, archetypal, acausal connections or correspondences between inner psychic and outer physical events. These experiences confirmed, for Jung, that individuation does not shut one out from the world, but gathers the world to oneself. However confused Jung's theory was, it succeeded in drawing attention to a baffling reciprocity between human consciousness and the outer world, a zone of experience where physical events appear, mysteriously, to collaborate with and support the individuation process (Jung 1947/1954, 1952; Aziz 1990; Mansfield 1995; Main 2004). Jung's theory of synchronicity led him, in turn, to his concept of the *unus mundus* (unitary world), which, drawing heavily on alchemical sources, affirmed that man as microcosm is of the same essence as, or indistinguishable from, the universe and identified his own midpoint with its center. While his concept of *unus mundus* was inconsistent with his professed metaphysical agnosticism, it enabled him to distinguish three phases of the individuation process: (1) the wholly intrapsychic process of withdrawing projections of unconscious contents from the material world, thereby separating consciousness from it; (2) the reunification of transformed consciousness with the material world, as in synchronicity, and with the body; and (3) the experience of unification of the whole psyche, the microcosm, with the macrocosm, during which time and space are transcended. Jung identified this third phase with the

alchemical image of Mercurius as a conjunction of opposites, which he believed anticipated the interconnectedness and ordered unity of the multiplicity of contents of the collective unconscious (Jung 1930–1934, 1941/1954, 1942, 1955–1956, 1958, 1963; von Franz 1975).

Jung also argued that the ultimate unity of the archetypes of the collective unconscious as well as of the multiplicity of the phenomenal world, equated by him with his concept of the *unus mundus*, is expressed with particular clarity by the symbol of the mandala. The mandala, an instrument of contemplation frequently used by Eastern and Western religious traditions to provide spiritual instruction, is a magic circle, square, flower, cross, or wheel, divided into four or its multiples, which emphasizes a central point of orientation and an ordered unity of its many parts. While refusing to identify the individuation process with the soteriological perspectives and goals associated with these religious symbols, he recognized them to be numinous, archetypal images signifying the wholeness of the self, the microcosmic nature of the psyche, and the divinity incarnate in man. As early as 1916, Jung began to produce his own mandalas and to understand them as cryptograms of the development of the self and the psychic process of centering taking place within him. This practice, which he encouraged his analysands to emulate, led him to the conviction that the mandala expresses the path to the center of psychic totality, the goal of individuation, realized through the circumambulation of the self. Moreover, Jung interpreted the frequent appearance of mandalas in the modern clinical setting, in his analysands' paintings and drawings as well as their dreams and visions, as either psychic images compensating for conscious confusion and disorientation or as instruments of contemplation facilitating the transformation of such psychic chaos into order (Jung 1931/1962, 1934/1950, 1950, 1955–1956, 1958, 1963).

The Conjunction of Opposites and the Unknowable Nature of the Self

Acknowledging the perils of the individuation process, psychosis on the one hand, and spiritual

inflation of the ego by numinous unconscious contents, particularly the self, on the other, Jung insisted that the individuation process is the product of a conjunction of two sharply opposed orientations. On the one hand, there is a tremendous experience of expansion, of an opening to the transcendental (an experience which the alchemist Gerhard Dorn described as the opening of a window on eternity), and on the other, an experience of the concentration of one's being, an emphasis on the value of the uniqueness and particularity of the personality requiring considerable ego strength. There is at the same time an experience of a boundless enlargement and of the narrowest of limitations in the ego. Only consciousness of our narrow confinement in the self forms the link to the limitlessness of the unconscious. The individuated person experiences himself concurrently as both limited and eternal. However, he is never more than his own finite ego before the deity who dwells within him (Jung 1952/1954, 1955–1956, 1963; von Franz 1975; Aziz 1990).

Jung also insisted that the individuation process can never be fully realized in this lifetime. He argued that there is little hope of our ever being able to reach even approximate consciousness of the self, since however much we may make conscious, there will always exist an indeterminate and indeterminable amount of unconscious material which belongs to the totality of the self (Jung 1906–1950, 1916/1928, 1952/1954, 1963). Clearly, for Jung, because the self is unknowable, the individuation process is qualified by its suspension between the opposites of the known and the unknown. Individuation is incompatible with unconditional acceptance of unqualified claims to religious knowledge; rather, it requires a humbling acknowledgement of the relativism of all knowledge and experience, albeit one grounded in numinous experience of the self. However, for Jung, this agnosticism is experienced not only as a limitation but also as an invitation, even a challenge, to consciousness to further explore its unknown psychic background, thereby extending its boundaries and understanding (Jung 1963; Hauke 2000; Rowland 2006).

Inflation

Leon Schlamm

School of European Culture and Languages,
Religious Studies Section, University of Kent,
Canterbury, Kent, UK

Jung’s Definition of Inflation

C. G. Jung defined inflation – an unconscious psychic condition – as expansion of the personality beyond its proper limits by identification with the persona or with an archetype, or in pathological cases with a historical or religious figure. It produces an exaggerated sense of one’s self-importance and is usually compensated by

feelings of inferiority (Jung 1934–1939, 1963). Most of Jung's comments about inflation are concerned with an identification of the ego or consciousness with the numinosity of an archetype (Jung 1934/1950, 1952), leading to a distortion or even dissolution of the former. The key to avoiding inflation is knowledge of the proper boundaries of the ego or consciousness, and this is achieved by discrimination between it and the archetypal contents of the collective unconscious – the self, anima, animus, and shadow – which possess psychic autonomy. When the ego can distinguish what belongs to itself from what belongs to the objective or transpersonal unconscious psyche, it will be free of inflation (Jung 1951).

Psychopathological Manifestations of Inflation

However, the psychic discrimination necessary to avoid inflation is very difficult to achieve, because the integration of archetypal materials into consciousness typically leads either to a ridiculous self-deification or to a moral self-laceration. The individual makes himself either a god or a devil (Jung 1917/1928, 1951; Edinger 1995), as the archetype through its power of fascination seizes hold of the psyche with a kind of primeval force and compels it to transgress the bounds of humanity. This causes exaggeration, a puffed-up attitude of inflation, loss of free will, delusion, and enthusiasm in good and evil alike. Jung equates inflation with the experience of godlikeness or of being superhuman, an extension of personality beyond individual limits. In such a state, a man fills a space which normally he cannot fill, and he can only do this by appropriating to himself contents and qualities which do not belong to him, because they belong either to someone else or to everyone or to no one (Jung 1916/1928). This experience may lead to fathomless transformations of personality, such as sudden conversions, as well as to a transitory or permanent disintegration of the entire personality. In all cases, whether inflation is the product of some innate weakness of the personality or encountered during an individuation

process, the real clinical difficulty is to free patients from the power of fascination by archetypal figures (Jung 1916/1928, 1951–1961).

The identification of consciousness with eschatological knowledge of the collective unconscious is one of the most frequent expressions of inflation, which can either be equated with megalomania or a form of prophetic inspiration providing a renewal of life for the individual. In either condition one can be so puffed up or overpowered by new knowledge as to be hypnotized by it and thus foolishly believe that one has solved the riddle of the universe and that all previous understanding is worthless. But this is almighty self-conceit (Jung 1916/1928). When lucky ideas from the unconscious come to the ego, it should not take the credit for them, but begin to realize how dangerously close it had been to inflation (Jung 1955–1956). Jung even speculates that inflation by knowledge, leading to a dangerous extension of consciousness, may be the nature of the deadly sin represented by the eating of the fruit of the tree of knowledge in Genesis 2:17, 3:5 (Jung 1916/1928, 1934–1939, 1941/1954, 1948, 1963; Edinger 1973).

The issue that Jung constantly returns to is our need to be aware of the pitifully limited nature of the ego, especially during individuation when the great psychic danger is that ego-consciousness will be identified with the *self* (Jung 1950, 1958). Inflation and man's hubris between them have elected to make the ego, in all its ridiculous paltriness, lord of the universe, and this is productive of nothing but anarchy and destruction (Jung 1938). If the ego has a spark of self-knowledge, it can only draw back and rapidly drop all pretense of power over the unconscious (Jung 1916/1928). Indeed, every encroachment by the ego into the realm of the unconscious which brings about inflation is followed by an encroachment into the realm of consciousness by the unconscious. An inflation is always threatened with a counterstroke from the unconscious, which in the Bible took the form of the deluge, the great flood of Genesis which destroyed civilization (Jung 1952/1954, 1944).

What this means in clinical terms is that inflation so enlarges the normal ego-personality as to

almost extinguish it. The result of such inflation (whether leading to megalomania or to a feeling of annihilation of the ego) is the same: an experience of a serious lesion of the ego (Jung 1946). Alchemy expresses this through symbols of death, mutilation, or poisoning, or the curious idea of dropsy, the desire to drink so much water that an individual melts away, expressing the experience of suffering from a surfeit of unconscious contents and psychic dissociation. Paradoxically enough inflation is a regression of consciousness into unconsciousness. This always happens when consciousness takes too many unconscious contents upon itself and loses the faculty of discrimination, the *sine qua non* of all consciousness (Jung 1944). This is why Jung argues that, when dealing with extreme cases of inflation, it is far more necessary to strengthen and consolidate the ego than to understand and assimilate the products of the unconscious (Jung 1934/1950). The decision in which way to proceed must be left to the diagnostic and therapeutic tact of the analyst.

Inflation, Deification, and the Shadow

The key to overcoming inflation lies in the recognition of the projection of the shadow and its painful integration into consciousness. Inflation by an archetype is irreconcilable with deflationary acceptance and befriending of the shadow. The conclusion to be drawn from this observation is that we Europeans in a state of unconscious possession must become scared of our god-almightiness (Jung 1944). If we do not, if we unconsciously accept a religious inflation, then we are in danger of putting the divine germ within us to some ridiculous or demoniacal use (Jung 1942/1948). In other words, the danger of accepting such a portentous claim as Nietzsche's that "God is dead" is that in becoming gods ourselves and thereby unconscious of our shadows, we are capable of a level of violence and destructiveness towards our fellow human beings never before known in human history. At the same time, Jung observes that

the inflationary effect of declaring God is dead is that one is forced to assume an awful responsibility for intrapsychic experiences, such as one's own dreams, which were hitherto believed to be caused by God (Jung 1934–1939).

Significantly, the danger of inflation of the ego by spiritual knowledge and experience is examined in the writings of Christian mystics and Sufis (Underhill 1961; Welch 1982; Sviridov 1997; McLean 2003), as well as transpersonally oriented psychologists (Wilber 1980; Naranjo 1987; Rosenthal 1987; Assagioli 1989; Caplan 1999). However, unlike these writers who can find no value in the experience of inflation for spiritual transformation, Jung acknowledges that inflation is one of the unpleasant consequences of becoming fully conscious, instrumental in the discovery of the boundaries of consciousness during the individuation process, a painful but necessary Luciferian deed of disobedience to both God and the unconscious (Jung 1916/1928, 1934–1939, 1948, 1963).

Initiation

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Initiation is a part of most religious traditions; at its heart it is a ceremony for beginning and an important part of the spiritual journey. Van Gennep (1909/1960) coined the phrase “rites of passage” to refer in general to those moments of transition where one moves from one social status to another. There are age-graded rituals, rites of passage from childhood into adulthood, from single to married status, and the final rites of burial

after death. But in addition to these major life passages, there are in each society a number of special groups one can join or is invited to join that have their own initiation rituals as part of entering into the community.

Initiation is an essential component of most esoteric constituencies within larger traditions; but rites of passage are also celebrated in the exoteric or more publically available forms of the tradition. Initiation is a particular type of beginning, one marked by a special process of preparation, often involving physical or psychological separation from one's current space and social status, which is moving toward the formal rite of transition. There is a basic distinction between being a spiritual seeker and an initiate into a particular tradition; the seeker has only an etic, or outsider's perspective on the group and its beliefs or practices, whereas the initiate now enters into an emic, or insider's perspective. The rite often is done in a very private, even secret ritual; only other initiates are allowed to participate. Given the possibility of people not being able to connect with a group, but wishing initiation, some esoteric authors have provided means for self initiation Ashcroft-Nowicki (1986). But not all initiations are secret; regular Christian baptism is part of public worship even though it is a type of initiation into the community of the faithful. Likewise, ceremonies validating conversion to a religion are public for reasons of affirmation of group identity.

Most attention, though, is given to initiation as a ceremonial entry into an esoteric tradition. The esoteric/exoteric distinction not only refers to the private versus public nature of the gatherings and communities but refers to an additional level or type of teaching that is conveyed. This special knowledge, or gnosis, is a teaching that is reserved for more dedicated students who take the opportunity to study beyond the basic level. Esoteric groups generally have "outer court" teachings which are conveyed through the most public means as a way of attracting prospective initiates. The "inner court" teachings then follow for those who show consistent interest. The process begins when a seeker attaches her- or himself to a teacher in the tradition. There is a period of preparatory

study before initiation and often tests of worthiness to continue. After the initiation ceremony, the student is now part of a community in which there may be additional levels or grades of initiation. A common example is Freemasonry where the Scottish Rite has 32° to reach the pinnacle of gnosis.

Among the oldest initiatic groups are the mystery religions of classical antiquity. In Greece the most popular initiatic group was the Eleusinian mysteries, into which Plato was admitted. The rites of Dionysus, Orpheus, and others flourished as well as mystery religions from Egypt (Isis) and Syria (Cybele and Attis). Persia was the source of the Mithraic initiatic tradition. In the Western esoteric traditions, most adherents of magic or witchcraft were structured as initiatic systems. In the nineteenth century, the Hermetic Order of the Golden Dawn became the quintessential initiatic system and the origin of most contemporary systems of ceremonial magic. The spelling of magic with a k is a convention used by adherents to distinguish the spiritual practice from stage magic or the art of the illusionist.

In Hindu and Buddhist traditions, initiation is closely linked to the strong relationship between the teacher (guru) and the disciple or student (chela). In the Western spiritual traditions, the teacher is not viewed as other than human, but in the two forms of Indian spirituality, the teacher is seen as the literal embodiment of the divine, as an incarnation of the deity. This imbues the relationship with a special intensity. If you see your teacher as divine, then obedience and veneration can become blinded to the humanity, leading to an increased potential for abuse. In the first generation of Indian gurus moving into the West, several teachers became embroiled in sexual and financial scandals with former disciples. But when the teacher maintains the proper role, then there is an effective transmission of both teaching and experiential practice that allows the student to grow in their chosen faith.

In the late Indian Tantric tradition, with both Hindu and Vajrayana Buddhist streams, the initiation takes on special significance and is termed an empowerment. The teacher not only gives teachings but gives primary instructions in

particular meditational practices. The teacher gives the student power to practice the technique under guidance. While it is not denied that in the modern world one can find texts of formerly secret Tantric initiations and can practice them without initiation, the teachers would add the proper use of the techniques under guidance that can only come from someone who is deeply grounded in the meditation technique.

Initiation across all traditions is a liminal process, that is, it is a vehicle and a process for bringing about transitions. Beginning at the transition from seeker to initiate, the ceremony moves the person from one state of development to another. As other degrees of initiation are conferred, the process of transition is repeated. At each juncture the ceremonial leader acts as a psychopomp to aid the person into a deeper understanding of the path on which they have embarked. The act of initiation can be seen as a parallel concept in the psychology of religion to the rite of passage in anthropology. The common thread is the crossing of a threshold from one state of being to another.

The psychology of initiation is likewise characterized by liminality, the movement from one phase of development to another. The rite of initiation itself marks off the boundary between ordinary time and sacred time, between ordinary space and sacred space, and between our ordinary way of being and a sacred and spiritual mode of being (Eliade 1959). Crossing boundaries involves gaining gnosis, or sacred knowledge, and also the core instructions for further practice of whatever spiritual techniques are taught. It is likened to climbing a mountain, or perhaps diving deeper and deeper into a well, but however the lived experience unfolds it is transformative. Initiation is just the beginning of a series of changes often interspersed with periods of stasis. One can have several initiatory experiences across a lifetime, each one unfolding a new mystery which may yet be seen as a continuation of the first mystery into which the seeker was drawn.

The process of counseling and psychotherapy can be likened to an initiatory process, as Jung understood through his own studies of esoteric lore which informed his depth psychology.

Particularly with clients new to therapy, there is some teaching of how to talk, what to talk about, and what limits there are to expression of feeling or rehearsing of new ways of acting. As the process unfolds over time, it deepens because of the cumulative nature of therapeutic dialog. The goal is to give the client the necessary tools to continue life without the help of the therapist, but with their own renewed and enhanced set of personal skills and values.

Instinct

Stefanie Teitelbaum
Faculty of National Psychological Association for
Psychoanalysis (NPAP), New York, NY, USA
Institute for Expressive Analysis (IEA),
New York, NY, USA

Introduction

Biological instinct is the innate, inherited fixed action patterns of responses or reactions to certain stimuli, both internal and external. These

responses or reactions are intermittent and fairly predictable within a specific species. Freudian instinct differs from strictly biological instinct in the uniquely human experience of a consciousness of the pressure to respond, the sometimes consistent presence of such pressure with or without identifiable stimulus, and the variation within the human species. Freud used the words *instinkt* and *trieb* (drive) to describe such instinctual pressure, often interchangeably.

Inconsistency about mind/body dualism is a core component in Freud's writings about instinct. Freud feared monism would make psychoanalysis a religious or mystical discipline and compromise its place in a scientific Weltanschauung. Biologically driven forces shaping humanity remain a problematic topic in religious thinking. The polarized debate between biological evolution and intelligent design persists. Segments of Judaism, Christianity, and Islam acknowledge the presence of instincts and a struggle with animal instincts but view the instincts as implanted by the Divine, fundamentally embracing a material monism. The Eastern, Islamic, and mystical Judeo/Christian objective in the struggle with the instincts is to achieve enlightenment and/or union with the Divine. Pragmatic elements of Judaism and Christianity incorporate the thoughts of Aristotle (350 BCE) and Descartes seeking to free and/or transform the energy of the instincts into rationality and free will, as did Freud.

Religion

Islam

In the Sahih Muslim, a collection of the hadith or oral transmission of the words of the prophet, Chapter 16, verse seven, states, "Indeed God specified one portion of His Mercy to the word, and with that a mother cares for her young and wild animals and birds care for each other." Modern commentators use this portion to argue Darwin's natural selection, stating that there is no scientific explanation for instincts other than of Divine origin.

Judaism

The Avot de-Rabbi Nathan (c.700–900 CE), considered to be a minor tractate of the Talmud, speaks of the Yetzer Tov and the Yetzer Hara, the inclination towards good and evil, as Divine forces driving human behavior. The Yetzer Tov is sometimes viewed as the voice of God in conscience.

1187: Moses Maimonides wrote the Guide for the Perplexed, drawing upon Aristotle and Descartes, to position Providence as the source of instinct, whose direction impels mankind towards free will.

Christianity

1265–1274: St. Thomas Aquinas wrote *Summa Theologiae*. His thoughts are similar to those of Maimonides, sharing the influences of Aristotle and Descartes. He states that animals are moved towards the future without knowledge of future by instinct, but instinct is planted in them by the Divine. He defined freedom from instinct as free will.

Psychology/Evolution

1809: Jean-Baptiste Lamarck publishes *Philosophie Zoologique*, theorizing the direct inheritance of characteristics acquired by an individual during its lifetime.

1853: Charles Darwin publishes *Origin of the Species*. Darwin's thesis of the interplay of natural selection and diversity contributing the modification of inherited instinctual inheritance behavior and motivation.

1896: James Mark Baldwin publishes "A New Factor in Evolution," proposing that acquired characteristics could be indirectly inherited based on an organism's ability to adapt to external stimuli during its lifetime (Turney et al. 1996).

Psychoanalysis

The index of *The Standard Edition of the Works of Sigmund Freud* (1975, XXVI) contains

nearly 1000 references to instinct, often contradictory, sometimes returning to previously rejected ideas. The primary areas Freud investigated are:

1. The transmission of inherited instinctual ideas

Freud grappled with the Darwinian-Lamarckian debate in scientific circles in turn of the century Vienna and was aware of Baldwin's theory. Throughout his body of work, he touched upon the theories of Darwin and Lamarck, starting with a biological parallel to Darwin, touching upon a monistic theory of instinct dedifferentiating much of the mind/body split, and returning to biology in his last works (Freud 1887–1902, 1933). Most Freudian scholars reject the accusation of Freud as Lamarckian (Garvey 2001).

The instinctual, inherited motivations that captured Freud's imagination include the incest taboo, the primal scene – a child's experience and/or fantasy of his parent's sexual intercourse, the murder of the Father of the Primal Horde, and the Oedipus complex (Freud 1913).

2. The breaking down of sexual instincts into its components in the theory of perversion.

Freud theorized that instincts have (1) a biological source a psychosexual zone; a body part cathected, or occupied, with libido most often but not exclusively referring to the mouth, the anus, and the genitalia; (2) an aim, an action to relieve the unpleasure of the sources of excitation; and (3) an object, the thing that would facilitate relieving built-up excitement. If the sexual instinct broke down into its components, the aim and object were dedifferentiated and the sexual perversions resulted. That is, in exhibitionism, the flasher will experience release of unpleasure in the act of exposing himself without orgasm or intercourse, thus merging the aim and object of the instinct. In Freud's teleological, evolutionary perspective, the perversions eclipsed the object of heterosexual genital intercourse, the necessary action for the survival of the human species (1905).

3. The conflict between sexual and ego instincts in the theories of neurosis, sublimation, and culture.

Freud's (1905) initial instinctual opposites were sexual and ego instincts, the forces of the Pleasure Principle and the Reality Principle. The sexual instinct sought release of unpleasure *unlust*, and the ego instinct attempted to odulate the pressure for release within socially and psychically approved places. When such congruence could not be reached, either a neurotic solution – sometimes called a compromise formation, or sublimation – the de-sexualizing of the instincts towards the object of art, civilization and religion, satisfied the need to release while disguising any violation of Reality Principle. The Superego became the psychical agency responsible for regulating instinctual pressures (Freud 1920). The metatheory of libido (Freud 1923) is inextricably linked to the metatheory of instinctual forces (Freud 1915).

4. Observations of the failure of the pleasure principle.

Freud conceived of a time in human development without conflicting instinctual demands in the idea of primary narcissism (1915). When Freud could not integrate the compulsion to repeat often painful experience with the metatheory of pleasure-seeking instincts, he formulated the concept of the death instinct 1920. The dualistic couple was of Eros and Thanatos. The death instinct was conceived along biological terms of an organism's urge to return to an inorganic state, free of object and desire.

5. The psyche's effort to represent instinctual life and bring it to consciousness.

Freud conceived a primary process as the psychical method of processing instinctual, biological sense impressions into thought that is understandable by the conscious mind. The elements by which these instinctual sense impressions are translated into thought are displacement, condensation, reversal, symbolization, secondary revision, and dramatization (Freud 1900).

Freud's Contemporaries and Post-Freudian Thought

Freud's (1915) formulation of primary narcissism opened a door for a Freudian instinctual monism, a concept embraced by Carl Jung and one of the theoretical points leading to Freud's break with Jung. Freud returned to his fundamental dualism, modifying his death instinct, thinking and positing opposing forces of life and aggressive instincts. The aggressive instinct was at first a concept of Alfred Adler and a key factor in the Freud/Adler break. Freud's Id (1920), the "great reservoir of libido," the source of instinctual energy, was an elaboration of an idea of Georg Groddeck. Both Freud and Groddeck "acknowledge the influence of Nietzsche in their 'its'." Groddeck's "it" is a structure of unity with no such material or instinctual dualism split. For a brief time, Freud's primary narcissism permitted a harmonious overlap with Groddeck and Jung. While Groddeck himself viewed his "it" from a Hellenistic rather than spiritual source, spiritual and existential psychoanalytic thinkers have used the Groddeck "it" in a spiritual context. Jung further posited that the instinct to worship, create, and play is innate, whereas Freud (1927) considered creativity, religion, and worship to be expressions of neurosis and/or sublimation, although recognizing the soothing and civilizing effect of religion as a life-affirming adaptation (Gay 1988; Greenberg 1990).

Ego psychology, notably represented by Heinz Hartman (1955), emphasized the ego's role in adaptation of the instincts, further solidifying a rebuttal of the Lamarckian implication. Early Object Relations Theory as conceived by Fairbairn emphasized the instincts seeking objects and internal or external representation of a soothing or persecutory person and/or idea into or against which to discharge instinctual pressure. Modern Object Relations Theory emanating from the British Independent School and then from American Object Relations has little reference to instinct. The death and aggressive instincts remain a critical component of Adlerian, Kleinian, and Modern Psychoanalysis, but the biological death instinct has not survived in psychoanalytic

thought. Heinz Kohut (1976), founder of Self Psychology, criticized Freud's reification of instinct and particularly challenged the innate nature of destructive or aggressive instincts, calling such phenomena an adaptive reaction to an inadequate environment. Attachment Theory posits an infant's instinct to emotionally and psychically attach to the mother as instinctive. Freud also spoke of the anaclitic, or helpless and dependent phase of the infant; attachment disorder may be seen as Freud's anaclitic depression, a failure of the object of the infant attachment instinct. Attachment Theory draws upon modern neurobiology, each of which refers back to Freud's 1902 biological perspective and rejects the biological death instinct (Fonagy 1999).

Commentary

The perspective of material dualism applied to Freud's writings about drive and instinct (LaPlanche and Pontalis 1972) might suggest that a good deal of Freud's writing about instinct would be more accurately defined as psychically determined drive. Perhaps Freud's inconsistency with the two terms reflects his own uncertainty about material dualism. On Narcissism (1914) suggests Freud's uncertainty in his commitment to instinctual dualism, and one wonders about the fate of such uncertainty without the Freud/Jung rift. Lorca's (1955) Duende "the energetic instinct" of the dark forces in flamenco and bullfighting may be seen as a synthesis of Jung's monadic creative instinct and Freud's dualistic death instinct. Ironically, Freud's thoughts about the nature of man were influenced by Aristotle and Descartes as were Maimonides and Aquinas, but Freud's own conflicts about religion prevented his being able to integrate his science with spirituality. Thoughts about struggle and material nature of Freud's opposing instinctual forces have much in common with thoughts about good and evil, and God and the Devil. While Maimonides and Aquinas are monists as to the substance of God, they are dualists in differentiating God and man.

The nature of libido – the energy of the sexual instinct – and its counterforce or split-off force of

death and/or destruction, and maintaining that source of that energy as biological, occupied a good deal of Freud's energy. Jung opened the door for the Divine source of instinctual libido in psychoanalytic theory, the substance responsible for all human instinctual energy much as Aquinas envisioned. William Blake's summary in *The Marriage of Heaven and Hell* is what eluded Freud, but implicit in religious and Jungian monism:

Energy is the only life and is from the Body and Reason is the bound and outward circumference of Energy.

Integration

Michael Zhang
School of Psychology, University of Sydney,
Camperdown, NSW, Australia

The integration project is widely viewed as a task undertaken by those interested in combining the concepts, methods, and practices of psychology with the concepts, methods, and practices of religious traditions. While integration necessarily implies discernible attempts to relate psychology and religion in some meaningful way, it is far more than a straightforward procedural undertaking. Stanton L. Jones (2006), a prominent contemporary purveyor of the integration of psychology and Christian faith, as an instance of religion, proposes a categorical approach to view the integration project that illustrates the depth of the

project – defending integration, describing integration, and doing integration – and expresses his concern that the time and effort spent defending and defining integration may interfere with doing the actual task itself. While this position regards integration as more than simply an activity, the purpose of defending the intellectual position demonstrating its necessity and describing models with which the task can be accomplished is to support the practical endeavor.

Perhaps there is an underlying fear that integration is easier said than done or that it cannot be done as envisioned, behind the urgency spurring calls such as those made by Jones (1994, 2006). Alternatively, proponents of integration might simply be looking for the level of respect, acceptance, and exposure afforded to many other disciplinary ventures based on their productivity. The problem, however, is that, despite increasing productivity, many existing practical attempts at integration evidence a sense of unpreparedness on the part of integrationists to adequately grasp the ideas behind and the implications resulting from their attempts.

For these reasons, integration, at its core, is perhaps best understood not strictly or even fundamentally as a task or an activity but as an assortment of issues that put into perspective the *relationship* of psychology and religion and which provide a context for actual attempts to integrate the concepts and practices of these two interpretive systems. The context in question goes deeper than defending or describing integration, which already take for granted the viability of such an approach. Rather, the sort of issues that form this context are largely philosophical in nature, concerning the possibility, plausibility, and practicality of integration, and involve exploring the relationship and examining the relatibility of the components of integration and considering the effect of these issues on imagined and illustrated attempts at integration. Therefore, the purpose of this entry is to consider a digest of the questions, debates, and uncertainty (Gleave et al. 2006) arising from the philosophical issues spanning this general area of interest.

Many integrationists show a basic awareness of the existence of these issues, to be sure, but, at the same time, they hold these issues to be surface-level matters rather than as having serious implications for the identity of the project at-large, which is evident in discussions about integration often taking place separately and distinctly from demonstrations of it. Not only is the project complicated by the variety of religious traditions that might serve as potential candidates for integration with psychology, or the increasingly sub-disciplinary (and fragmented) nature of the psychological field, which raises the question of which combinations of psychology and religion are most suitable, sensible, or in demand; not only is integration met with skepticism from the suspicion or anticipation of biased, subjective, or irrational religious influences on a neutral, objective, and rational scientific enterprise such as psychology, there is also the elementary question to which a definitive answer has not been proffered by integrationists themselves – is integration possible? – because, to them, it is not a question, so much as a decision. More often than not, while they might be aware of the positions held by detractors, they have nevertheless simply assumed that integration is possible, as if not a matter for debate. Rather than considering the question of integration, many integrationists make the *apriori* decision that it is possible, drawing on the weight of “successful” integration attempts as evidence for this claim.

However, not only are their notions of success conceived within their own unproven ideas about how integration should proceed but a deeper understanding of the ontological assumptions made by the respective traditions appointed for integration reveals that possibility cannot be merely assumed or claimed, as many integrationists have done, knowingly or not. A thorough examination of whether the integration of psychology and religion is theoretically or actually possible is rarely considered by proponents or practitioners to the extent that Slife (2005) discusses when determining the compatibility of psychology and religion. According to Slife, the way

to address the question of possibility is to consider the degree of compatibility. Only if religion and psychology are compatible, is it appropriate to employ an integrative approach; otherwise, combining the two would result in something other than what is intended. The conceptual grounding of the two traditions may be so different that integration, if taken to mean the merging of disparate interpretive systems while retaining internal consistency, is not possible at all.

Slife tackles the compatibility issue more comprehensively than most integrationists and commentators, for whom there is a tendency to simply assume, assert, or accept that psychology and religion are compatible or incompatible domains, without the sort of analysis required to adequately support their understanding. By drawing on an ontological analysis, Slife explains that the worldviews or interpretative systems of psychology and religion are fundamentally incompatible. The theism of most religions is at odds with the naturalism undergirding the science and practice of psychology, as the godlessness and lawfulness that are part and parcel of a naturalistic worldview cannot be reconciled with the theistic first premise of a currently and actively involved God. The logical contradiction of assumptions as antithetical as godlessness and divine activity is what denotes this incompatibility, since God cannot be both absent and present, inactive and active, non-existent and real at the same time. Even attempts to make them compatible through the use of dualisms such as deism demonstrate their ultimate incompatibility, since the naturalistic is always separated from the theistic (e.g., God was active in the creation of the world, which has since operated on autonomous, natural laws), unable to coexist. Such attempts would, in fact, be unnecessary if they were already compatible.

Although this incompatibility already raises serious questions about the possibility of actual or meaningful integration, it also signals a much deeper problem – that of incommensurability. Two interpretive systems are incommensurable if there is no neutral logic for judging their relationship, including whether, or in what aspects, they

may be integrated (Slife 2005). In the case of the interpretive systems of religion and psychology, it is unclear whether there is a neutral standard of rationality by which they can be compared. Not only do they differ in what they consider to be rational, they also disagree about whether neutrality is necessary. Religion tends to be defined by its biases, whereas psychology typically strives to be free from bias, whether in science or its practical applications. The incompatibility of their fundamental assumptions is further typified in their incommensurability for comparing these assumptions. To integrate incompatible and incommensurable interpretive systems means that one system will inevitably be incorporated into the other. According to Richardson (2006), this is akin to “surreptitious domination,” as it implies that “one party will dominate in a somewhat arbitrary and dogmatic manner that violates the original intention... of the integrationist program” (p. 242).

Attempting to “integrate” psychology and religion, therefore, has important implications. Gleave et al. (2006) observe that the differences between psychology and religion are so great that “one cannot be subsumed into the other without significant losses” (pp. 78–79). When the assumptions of one are incorporated into the assumptions of the other, the differences of the incorporated are interpreted according to the incompatible and incommensurable identity of the incorporator (Slife 2005). This means that the identity of the incorporated is altered and thus not preserved when it is “integrated” with the incorporator. The upshot is this is not really integration, since integration necessarily entails the preservation of the irreducible differences, uniqueness, and wholeness of those candidates being merged.

How, then, should the many practical attempts at integration be understood? First, there appears to be a widespread misunderstanding of the conceptual basis of integration, such that a real relationship between religion and psychology is compromised when integrationists endeavor to combine them. While they might have constructive intentions, the end products of their attempts to integrate psychology and religion are

destructive to the *relationship* between the two enterprises. Second, this misunderstanding may actually be integral to the dialogue between them, enriching our understanding of what their relationship really is.

The undeniably expansive role of integrationists in determining the scope of their projects is also illuminated. Richardson (2006) suggests that the question we need to ask is: “who or what decides on the terms of this integration?” (p. 242). The terms, as they stand, seem to depend more than anything upon the integrationists at the helm of a given project. However, despite what they might believe, not all attempts to integrate psychology and religion will result in actual integration. Rather, as this entry shows, integration may not be possible or even necessary. Therefore, it makes little sense to consider the viability or fertility of specific instances of “integration” without first understanding the conceptual issues identified herein.

Interdisciplinarity

Peggy Kay

Minneapolis, MN, USA

Division 36, Psychology of Religion and Spirituality, American Psychological Association, Washington, DC, USA

Division 32, Humanistic and Existential Psychology, Transpersonal Psychology Special Interest Group, American Psychological Association, Washington, DC, USA

Definition and Meaning

Interdisciplinarity compares, contrasts, puts into dialog, and potentially combines multiple academic disciplines for a more holistic field of study. It is the formulation of a new, interdisciplinary field of study in order to consider each discipline in a larger and interrelated context. The need for the larger context is often created by a purpose or theory or problem that needs a larger solution than would come from within one discipline or one profession. In this Encyclopedia, we consider the dialog between the discipline of Psychology, a Social Science, and Religion, from the Humanities. Ethics can also be involved, as well as Philosophy and Theology. We examine how each discipline influences, contrasts, compares, and integrates with the other to address the larger concern for understanding human experience, history, tradition, and life in the intersection of the two or more disciplines. Another example would be Medicine, Biology, Anthropology, and Sociology working together to resolve cross-cultural medical and social issues. The need for interdisciplinarity often arises from greater complexity characterizing research and teaching. When multiple disciplines are used, in this way they are called interdisciplinarity.

Methodology

Interdisciplinarity can be thought of as a methodology in and of itself. It is primarily a comparative

study, or the comparative method. “Comparative method” is the primary method used, for example, by Rudolf D’Souza in *The Bhagavadgita and St. John of the Cross* (1996, pp. 8–14), as he compares religions. D’Souza cites the following definition (p. 10) of this method by M. Dhavamony in *History of Religions* (see D’Souza Bibliography, p. 450), and D’Souza predicates his comparative methodology on this definition, which serves here to describe the comparative nature of interdisciplinarity:

Generally speaking, comparative method is the study of different types of groups of phenomena in order to determine analytically the factors that lead to similarities and differences in specific patterns of behavior. . . This method involves the procedures that, while clarifying the resemblances and differences displayed by the phenomena, elicit and classify not only causal factors in the emergences and developments of such phenomena but also patterns of interrelation within and between such phenomena.

D’Souza, in the interest of furthering interreligious dialogue “animated by the spirit of Vatican II” (p. 8), compares Christian and Hindu doctrine by comparing the texts of St. John of the Cross from Christian tradition with the Bhagavad-Gita scripture from Hindu tradition. Because of the scope and complexity of the task of comparing two entire religious traditions, he has selected only the doctrine of spiritual dynamism as the point of comparison. D’Souza looks at the phenomenology of “the dynamism of spiritual growth” both in the Bhagavad-Gita and in the writings of St. John of the Cross and then compares how the selected texts from the two traditions regard that phenomenology. D’Souza’s goal in his comparative study is to provide a scientific study of the whole dynamism of spiritual growth (p. 14). His resulting theory is that the doctrine of dynamism in one religion can be informed and expanded by the doctrine in another religion. This is a classic example of comparative study, within one discipline, Religion, but the approach, methodology, purpose, and yield are prototypical of interdisciplinarity as a comparative study.

Another comparative method which will provide a referential framework of interdisciplinarity

itself is the method used by Kevin Culligan (1982 pp. vi–viii and 11–16) in his comparison of the psychotherapy of psychologist Carl Rogers with the tradition of spiritual direction as seen in St. John of the Cross. This example shows comparison of psychology and religion. Culligan's primary methodological structure is exploratory research design, within which he analyzes selected texts from both Rogers and St. John. He then synthesizes the results of his textual analysis into a comprehensive but preliminary theoretical model of spiritual direction based on both thinkers. His comparative method in the process of his exploratory research design is his interdisciplinary comparison of the psychology of Rogers and the theology of St. John using spiritual direction as the point of comparison. Culligan has selected the texts of St. John to represent and explicate the tradition of spiritual direction from the Christian religion, which he compares to Rogers' theory of psychotherapy, from psychology. He then demonstrates how Rogers' contemporary psychotherapy can inform the extant tradition of spiritual direction without diminishing its character as a pastoral or spiritual ministry in the Christian religion. Culligan's methodology demonstrates how the modern aspects of Jungian psychology can also inform and expand St. John's spiritual theology.

D'Souza provides primarily a comparative study design as applied to a selected doctrine from two different religions. This same design may also be used to compare a central theme in two different bodies of knowledge such as theology and psychology. Culligan provides a comparative study design for an interdisciplinary comparison of religion, theology, and psychology. This comparative study design is the primary framework for interdisciplinarity.

Multiple aspects of disciplines can be points of comparison in interdisciplinarity, including but not limited to:

- Selected texts
- Territories of thought culled out for comparison

- Key figures/thinkers
- Comparable or competing theories
- Analyses of texts, thinkers, and theories from each discipline
- Interdisciplinary analysis of analytical yields from each discipline

In Culligan's interdisciplinary comparison, Carl Jung is the psychology figure to be examined, and St. John of the Cross is the theology figure to be examined. Carl Jung is the most widely regarded psychologist known for dealing with the spiritual and theological phenomenological dimensions of the person. St. John is a Doctor of the Church in Catholic theological tradition within the Christian religion, known as well for what today we would call his psychological understandings of the person due to his highly developed skills in the tradition of spiritual direction. From the corpus of each thinker, texts are selected which focus on the point of comparison, spiritual transformation. In the writings of Carl Jung, this is his theory of individuation, and in the writings of St. John it is his concept of the dark night in spiritual development, as found primarily in his work, *The Dark Night* (of the soul).

Subsequent to the interdisciplinary analyses, future research can be done based on the theory of the integrated understanding provided by the interdisciplinarity. The theory can then be reformulated as a model and tested as the integral approach is developed in research and practice. This provides a newly integrated understanding and can suggest a theoretical, conceptual model to provide a foundation for future research and therapeutic practice.

Interdisciplinarity, then, through its comparative nature, brings into analysis varying disciplinary views, in our case Psychology and Religion. Their two different perspectives on human development and its context and effect on lived experience are integrated into a greater conceptual or theoretical whole, which will foster greater understanding for both or all of the participating disciplines.

Interdisciplinarity as Academic Transformation

Historically, interdisciplinarity has existed as long as thinkers have considered knowledge and ways of knowledge, which has developed over time into extensively detailed and formally developed distinct and specialized academic disciplines. Wikipedia succinctly states, “Any broadminded humanist project involves interdisciplinarity.” In recent years, the need for more holistic understanding and solutions has emerged and become understood as integral studies, manifesting as interdisciplinary programs and some degree programs in Interdisciplinary Studies. Interdisciplinarity has become widely accepted as legitimate and often necessary approach to academic study, research, and teaching. The Oxford Handbook of Interdisciplinarity summarizes the state of interdisciplinarity and its importance today.

Interdisciplinarity is fast becoming as important outside academia as within. Academics, policy makers, and the general public seek methods and approaches to help organize and integrate the vast amounts of knowledge being produced, both within research and at all levels of education.

Interfaith Dialog

Louis Hoffman¹ and Matt Thelen²

¹Saybrook University, Oakland, CA, USA

²Colorado Springs, CO, USA

Interfaith Dialog is a specific type of interaction between religious and/or spiritual groups intended to build bridges and foster understanding between religious groups. The terms “interreligious dialog” and “interchurch dialog” often refer to the same process. Interfaith Dialog is intentionally more inclusive in that it can refer to dialogs within a religion (i.e., intrachurch dialog) or between religious groups (dialogs between sects or denominations). Dialog between and within religious groups can occur on multiple levels of communication ranging from the individual level to the institutional level where a designated spokesperson represents beliefs held by the group. As the size of the groups engaged in dialog increases so does the risk that political motivations will impede understanding of the other’s position (Magonet 2003). For this reason, the essential purpose of interfaith dialog is to understand and respect the other individual or group’s faith as they experience it.

Distinguishing Interfaith Dialogs from Other Religious Conversations

The motivation for conversation often distinguishes interfaith dialog from other forms of interactions between faith groups and individuals. *Evangelism* is a type of conversation intended to persuade the other person into changing their religious or spiritual affiliation. *Debate* is intended to use rational means to convince the other party that one’s own views are correct. *Assimilation* refers to the forceful adaptation to a secondary religion. *Apologetics*, when embedded in conversation, is intended to provide a rationale or defense of faith. Apologetics often emerges as part of

conversations between faith groups and science with the motivation of defending faith against science. *Teaching* assumes a power differential in which was in educating the other individual about a belief system. *Mentoring*, similarly, assumes a power differential in guiding one into a particular belief system. *Ex-communication* refers to the banishment of an individual from a religious group. *Revelation* refers to communication between an individual and a metaphysical source.

An interfaith dialog, conversely, emphasizes equality between participants to facilitate learning from the other. The purpose is not to change the other's faith or belief system, but rather seeks to foster understanding, deepen one's beliefs, and potentially adapt one's beliefs. In the tradition of Martin Buber (1965), dialog embraces openness to being changed by the encounter. This change may entail reconsidering one's own beliefs and/or deepening one's understanding or appreciation for the perspective of the other individual or group. Several motivations can exist as to why one would enter into an interfaith dialog. First, it is useful in the ecumenical purpose of establishing common ground as a deterrent to stereotypes, conflict, and terrorism. Many Protestant denominations have entered into interfaith dialogs in order to establish an ecumenical relationship with other denominations in which they share resources such as ministers and theologians. Moreover, interfaith dialog is a strategy that can be used to encourage open worship across denominational lines and to better serve the needs of a diverse congregation. Second, interfaith dialog is often engaged in to promote understanding. Since the terrorist attacks of September 11, 2001, on the pentagon and World Trade Centers, many religious institutions, including Christian, Muslim, and Jewish institutions, recognize the benefit of dialoging about differences and similarities (Takim 2004). A primary intention of these dialogs is to dispel misunderstandings that led to the other group being perceived as a threat or danger. Similarly, many attempts at promoting peace in the Middle East have utilized interfaith dialogs to help establish a more respectful understanding of religious differences. This ties to a third motivation for interfaith

dialog: promoting peace. An emergent theme of interfaith dialogs is to promote an understanding that all major world religions value compassion and peace. Dialogs can dispel the misperceptions and prejudicial views that some religions advocate for war, forced acculturation, and even genocide. Although most of the major world religions have a history of engaging in genocide and war, interfaith dialog has helped clarify that this is the result of mistaken, misused, or misguided theology, not an essential proclivity for violence and killing within the religious group. Last, some of the deepest forms of interfaith dialog return to Buber's (1965) ideas of the openness to change and growth through dialog. Some religious groups believe that while retaining the core tenets of their belief system, they can grow through interfaith dialog. This may include incorporating beliefs of different religions or may refer to sharpening one's own beliefs through comparison and conversation. An example of this is the interfaith dialog between Judaism, Christianity, and Buddhism engaged by John Cobb, Jr., Maslo Abe, and others (Cobb and Ives 1990).

One of the complexities of interfaith dialog is how this intersects with other forms of diversity. Scholarship on intersectionality predicts that religious identity will have a reciprocal influence on other dimensions of personal identity including race, gender, and physical ability, among other aspects (Bright et al. 2016). Psychological perspectives are often interested in how interfaith dialogue necessitates dialog across sections of the population who construct group identity from multiple attributes and values. Simply stated, interfaith dialog is likely to correlate with interracial dialogue or other factors that have the potential to influence the quality of dialogue.

Barriers to Interfaith Dialog

A primary barrier to interfaith dialog is what Schneider (2013) refers to as *polarization*, which he defines as "the elevation of one point of view to the utter exclusion of competing points of view" (p. 1). Religious and political polarization have increased and become more visible in popular

culture in recent years. Polarization, with its lack of openness to different perspectives, stands in stark contrast to the purpose of interfaith dialog. Schneider advocates that applying the principles of depth psychology, particularly those in the humanistic and existential traditions, can be used to move beyond polarization. As such, these principles can be useful in promoting interfaith dialog.

A religious group's literary interpretation of sacred texts can mediate participation in interfaith dialogue. A natural literalist, and to a lesser degree conscious literalist interpretation of religious texts, will suppress dialogue because faithfulness is determined by adherence to the basic meaning of the text's words (Borg 2002). For literalists, faithfulness is enhanced through conformity to the text's word and this practice is not dependent on interfaith dialogue. Conversely, interfaith dialogue has the potential to enhance faithfulness for followers of a postcritical interpretation of sacred texts because faith is enriched through the process of integrating cognitive and emotional sources of information.

Religious groups that utilize a literalist interpretation of sacred texts are more likely to engage in conversation with people from other faith traditions to convert others to their own religious or spiritual affiliation. This, however, has led to distrust of the motivations for why many engage in interfaith dialog. Many religious groups who have a minority status or who have been subjected to prejudice and discrimination are fearful of other religious groups that show interest in them. The suspicion of ulterior motives makes it difficult to establish the trust necessary to engage in genuine interfaith dialog.

Psychology, especially peace psychology, has played an important role in researching, assessing, and promoting interfaith dialog. Psychology's interests are often in increasing peace and conflict resolution. However, interfaith dialog is also relevant on a more personal level. As interfaith marriages and families increase, a need for assisting couples and families becomes important for many therapists and counselors. At the institutional level of communication, business and organizations frequently turn to psychological and mental health professionals for assistance in dealing with

religious differences as the work environment becomes more religiously diverse.

Intersubjectivity

Pamela Cooper-White
Union Theological Seminary, New York,
NY, USA

Intersubjectivity, a term originally coined by the philosopher Edmund Husserl (1859–1938), is most simply stated as the interchange of thoughts and feelings, both conscious and unconscious, between two persons or “subjects,” as facilitated by empathy. To understand intersubjectivity, it is necessary first to define the term subjectivity – i.e.,

the perception or experience of reality from within one's own perspective (both conscious and unconscious) and necessarily limited by the boundary or horizon of one's own worldview. The term intersubjectivity has several usages in the social sciences (such as cognitive agreement between individuals or groups or, on the contrary, relating simultaneously to others out of two diverging subjective perspectives, as in the acts of lying or presenting oneself somewhat differently in different social situations); however, its deepest and most complex usage is related to the postmodern philosophical concept of constructivism or, in social psychology, social constructionism – the notion that reality is co-constructed by participants in a relationship and in society. The term subject is preferred to the term self by many postmodern philosophers and psychoanalytic theorists because subject suggests fluidity, mutability, and contingency in relation to influences from outside oneself, while self suggests a reified entity, structure, or even essence (somewhat akin to the term soul). “Intersubjectivity,” then, denotes a more reciprocally influential and dynamic interaction than a “subject-object” relationship in which one partner in the dyad (the “object”) is characterized by the gaze of the other (the “subject”).

In sociology, Peter Berger and Thomas Luckmann used the term intersubjectivity initially to highlight the distance between the immediate sense of reality presented by one's own bodily experience and the awareness that others operate in the world from a parallel but different locus of bodily experience of their own. However, it is precisely in negotiating between one's unquestioned everyday reality and externally perceived “provinces of meaning” that others' experiences may, at least temporarily, become definitive for one's own, expanding one's sense of reality or even transporting oneself to “another world.” Socialization, then, plays a central role in defining what “reality” is, and reality itself is socially constructed. They point out that “aesthetic and religious experience is rich in producing transitions of this kind, inasmuch as art and religion are endemic producers of finite provinces of meaning” (Berger and Luckmann 1967, p. 23).

Social psychologist Kenneth Gergen has written extensively on the ways in which knowledge of oneself, others, and the world are constructed not in the isolation of individual minds, but in and through relationships. Rejecting the notion that knowledge is purely empirical and cumulative, Gergen has argued that “truth” is always value laden and, therefore (drawing from critical theory), “reality” is not immutable, but always is understood via interpretation. More attention, then, should be given to the outcomes implied by any given assertion of reality, rather than to its “accuracy” as measured by its supposed correspondence to absolute truth. In place of either foundationalist claims to truth or unmoored relativism, Gergen has advocated for the mutual construction of relational “discursive imaginaries” that would not be defended on the basis of their claims to reality, but rather on the basis of “scenarios that could support a common desire to pursue viable futures” (Gergen 2007, p. 365). Gergen finds this as compelling for religion as for science, and relevant for virtually any cultural discourse threatened by schism over competing claims to absolute truth. Gergen's constructionist vision, and that of other social psychologists and sociologists of knowledge, has been influential in some family therapy circles (Flaskas 2002) and has also provided a philosophical impetus for various forms of narrative therapy where the construction of life-giving personal stories and the deconstruction of internalized hegemonic or oppressive interpretations are a focus of therapy (White and Epston 1990).

The concept of intersubjectivity has also been a central theme in contemporary psychoanalysis. The emphasis has shifted from a one-person psychology (intrasubjective or subject-object) to a two-person psychology (mutually influential or subject-subject) (Aron 1996). Two initially separate but similar psychoanalytic movements developed in the 1980s that utilized intersubjectivity as a key to understanding therapeutic action and the therapeutic relationship. Emerging from Self Psychology (drawing on the Chicago analyst Heinz Kohut's theories of empathy and “vicarious introspection”), American analysts Robert Stolorow, George Atwood, Bernard Brandchaft and Donna

Orange developed “intersubjectivity theory” to describe the mutual influence of the conscious and unconscious minds of patient and therapist and how the unconscious relationship could become a tool for deeper empathic understanding of the patient’s psychic structure and therapeutic needs.

Roughly at the same time, drawing from both philosophy and contemporary trends in object relations theory, Jessica Benjamin developed a theory of intersubjectivity that was a central concept in the emergence of “relational psychoanalysis.” Drawing on constructivism and the idea that reality is co-constructed by participants in both conscious and unconscious relationship, relational psychoanalysts have advocated for a shift in psychoanalysis from a one-person to two-person psychology (e.g., Hoffman 1991; Mitchell and Aron 1999; Mitchell 2000) as well as a recognition that the therapeutic relationship itself formed an “analytic third” (Benjamin 1998; Ogden 1994, pp. 61–95) – a shared subjectivity that in some sense had a life and a mind of its own. Countertransference is emphasized as a positive tool for understanding the patient in this branch of psychoanalysis, because via intersubjectivity, it came to be understood that the patient’s inner world could influence the subjectivity of the therapist, providing an empathic entrée into the patient’s own subjectivity. The therapeutic relationship is no longer viewed as existing between two entirely separate individuals, but rather as a shared pool of thoughts, feelings, fantasies, bodily sensations, and other subjective experiences that may be tapped for shared understanding by both partners in the therapeutic enterprise. Transference and countertransference, similarly, have come to be understood not as two opposing psychological forces in the treatment, but rather as a continuum of psychic experience and a bridge for empathy. These ideas are not entirely new in psychoanalysis and harken back to Sigmund Freud’s (1915/1957) statement, “It is a very remarkable thing that the Unconscious of one human being can react upon that of another, without passing through the Conscious” (p. 194).

In recent years, theorists from the intersubjective school and relational psychoanalysis have

begun to dialogue and, as schools of thought, have converged via conferences and publications – especially the journal *Psychoanalytic Dialogues*. Recently, Jungian analyst Andrew Samuels has also contributed to the evolving articulation of relational psychoanalysis and intersubjectivity theory, constructing a bridge between American psychoanalysis and British Jungian analytical psychology while, slightly earlier in Italy, Jungian analyst Silvia Montefoschi was also exploring “interdipendenza e intersoggettività” in the analytic relationship (see also Stevens 1986).

The psychological theories presented above have been further validated by infant observation studies that demonstrate how the psyche of an infant is formed (and/or damaged) in the context of mutual influence and regulation (or dysregulation) of affect between the infant and his or her primary caregiver (Beebe and Lachmann 2005; Stern 2000). The idea of a mutual influence and interplay of minds is further validated by the discovery in neuroscience of “mirror neurons,” which function to allow one person to think, feel, and even construct another’s motor activity and even the motives behind it, based on the observed actions of another (summarized in Blakeslee 2006). Neuroscientist V.S. Ramachandran (2009) has stated, “There is no real independent self, aloof from other human beings, inspecting the world, inspecting other people. You are, in fact, connected not just via Facebook and Internet, you’re actually quite literally connected by your neurons.” It is these “Ghandi neurons,” Ramachandran claims, that enabled empathy among primates and, on a much larger evolutionary scale, made civilization itself possible via imitative learning and cooperation.

There is an emancipatory ethic implicit in the theoretical shift from objectivity to intersubjectivity. Indeed, the modernist valuing of “objectivity” (especially since the Enlightenment in the eighteenth century) – the idea of a pure and undistorted neutral view of the “other” as object – is replaced in intersubjectivity theory by an appreciation of the irreducible otherness of each partner in a relationship and of the mutual influence inherent in any encounter. Inherent in this shift is a further appreciation for the fallibility of any final

or definitive understanding of the other as well as a rejection of a utilitarian view of the other as an object to be defined or used for one's own individual ends. In the larger context of culture and society, including religious institutions, the recognition that reality is socially constructed is the first step toward unmasking the dominant paradigm or prevailing worldview in any given society as just one discourse among many – but a discourse of power that underlays and justifies unequal social structures and institutions. This analysis draws back the curtain to reveal how power has masqueraded as the only way to truth, thereby opening the way toward empowerment of and dialogue among a wide variety of perspectives that have been marginalized and suppressed.

González et al. (1994), among others, have also shown the application of social constructionism to therapeutic work with culturally different clients, as a way for therapists to decenter their own cultural biases and assumptions that reinforce social injustice and inequality. Feminist theorists have also found the relationality of intersubjectivity theory and constructivism to be congenial to advocating for non-patriarchal, non-hegemonic psychological theories and therapeutic approaches (e.g., Benjamin 1998; Chodorow 1986; Gilligan 1985, 1986; and by extension, the writings on “relational-cultural therapy” from the Stone Center at Wellesley College, e.g., Jordan 2009). Complex arguments regarding the relationship of self and other have been further developed in both philosophy (e.g., Levinas 1969; Merleau-Ponty 1945; Ricoeur 1992; Schutz 1972) and postcolonial studies (Bhabha 1994; Spivak 1996). Ethical questions arising from these writings exceed the scope of this entry, but their diverse reflections are conceptually linked to intersubjectivity via a common turn from positivism to hermeneutics and discourse studies; from the positing of an essential self to a constructed, social, and/or narrative subject; and from a value for oneness to a valuing of difference and the other.

Intersubjectivity theory and relational psychoanalysis have begun to be incorporated into pastoral theology, care, and counseling, providing an

avenue for rapprochement between the disciplines of pastoral counseling and psychoanalytic theory (e.g., drawing on relational psychoanalysis and intersubjectivity theory, Cooper-White (2004, 2007, 2010) and Hoffman (2010); drawing on Kenneth Gergen's psychology of knowledge, Doebling (2006); and drawing on constructionism and narrative therapy, Neuger (2001)). The inherent emancipatory ethic of intersubjectivity is a natural fit for the contemporary emphasis in pastoral theology, care and counseling on social justice and the valuing of diversity.

There are several natural theological dialogue partners for this attention to intersubjectivity in both pastoral theology and the psychology of religion. The work of the Jewish philosopher Martin Buber, especially his formulation of the “I and Thou” relationship, is perhaps the clearest theological articulation of intersubjectivity (without using the term *per se*): “Inscrutably involved, we live in currents of universal reciprocity” (Buber 1970, p. 67). For Buber, this ephemeral contact with the “Thou” of the other participated in the divine. In Christian theology, there has been a turn toward relationality, especially working in overlapping terrains of feminist, postmodern, and Trinitarian theology (e.g., Cooper-White 2007; Johnson 2002; Keller 1988, 2003; Milbank 2009; Tanner 1997).

Finally, it should be noted that the term intersubjectivity is scarcely needed in the same way in non-Judeo-Christian religious traditions. Eastern cultures and religions have never been so characterized by the individualism that Western intersubjectivity theory interrogates and contests. However, further exploration by psychologists of religion into eastern concepts of self, other, mind, and consciousness would be fruitful for the continuing development of intersubjectivity as a lively and critical concept in the West.

Intimacy

Carol J. Cook

Louisville Presbyterian Theological Seminary,
Louisville, KY, USA

Although “intimacy” is commonly understood to refer to experiences characterized by a sense of closeness and connection, scholars who study intimacy agree that no generally accepted, formal definition of intimacy exists. Thus, attempts to study intimacy have taken a variety of approaches, two of which dominate. Within psychology, several branches focus on intimate *interactions*, especially those that take place within couples. Others follow in the tradition of Erik Erikson (1950/1963) who described intimacy as an *individual capacity*, naming the sixth stage of psychosocial development “Intimacy vs. Isolation.” This “dual” understanding of intimacy as primarily relational and/or as a state of being is reflected in dictionary definitions.

Webster's Third New International Dictionary defines intimacy as a “close personal relationship especially marked by affection or love (as in close friendship),” one “marked by depth of knowledge or broadness of information.” *The Oxford English Dictionary*, 2nd ed., defines it as “The state of being personally intimate” rooted in the Latin word *intimus* meaning “inmost, deepest, profound or close in friendship.” As an adjective, intimate first refers to “most inward, deep-seated; pertaining to or connected with the inmost nature or fundamental character of a thing; essential; intrinsic.”

Few encyclopedias or dictionaries of psychology include an entry on “intimacy” with the exception of *Encyclopedia of Psychology* (Archer 2000) and virtually no theology or biblical series contains one. Given these common dictionary definitions, however, it is not surprising that language of intimacy infuses descriptions of religious experience. In this context it is used to refer to persons’ relationship with God, experiences of worship, prayer, engagement with holy texts, and a sense of spiritual interconnectedness and communion with other persons that may

extend to all of creation (Thorne 2003). Although it has increasingly become the domain of scientific study, attempts to articulate intimate experiences have long been the domain of lovers, poets, mystics, novelists, and theologians, those who try to express that which is “inmost, deepest, and profound.”

Historically, the *OED* traces the appearance of the word intimacy in English to the mid seventeenth-century. Fletcher (2002) asserts that an academic exploration of intimate relationships in the West goes back at least to Plato’s *Symposium*. Perlman and Fehr (in Perlman and Duck 1986) date the formal study of experiences of intimacy in modern times to the early twentieth-century writing of Georg Simmel, neo-Freudians such as Sullivan and Fromm who “emphasized our need for ‘chums’ and ‘unity’” in the 1930s, and to the attachment theory work of Bowlby and others.

It has only been in recent decades that attempts to study intimacy empirically have multiplied, making it a core theme in the emerging field of relationship science. It now comprises a topic of interest to researchers, theorists, and clinicians and to those who come from a variety of fields including social psychology, clinical psychology, developmental psychology, family studies, and communication studies. Since studies have been so diverse and unsystematic, in their *Handbook of Closeness and Intimacy*, Mashek and Aron (2004) sought to compile some of the most salient research from what is now a “critical mass” into a single volume. They acknowledge, however, that “the study of closeness and intimacy has not yet gelled into a fully coherent field with researchers regularly citing (or in some cases even being aware of) each other and building on each other’s work” (2). Thus, as part of the “new science of intimate relationships,” it requires further refinement, integration, and theoretical clarity.

A variety of challenges confront scholars who study intimacy (Prager 1995). These include the difficulty of determining what distinguishes it from other similar or overlapping concepts such as love, attachment, commitment, sexuality, and closeness; whether it is primarily an individual capacity or relational process; what constitutes

an appropriate “unit of study” (interactions or the relationship); how to measure it; whether and how factors such as mutual self-disclosure, power, sexual orientation, and gender impact intimacy; verbal connection in contrast to physical touch and sexuality; and how different cultural understandings of the self affect research outcomes.

An assumption that has been repeatedly reinforced through research suggests that intimate interactions and relationships provide significant health benefits, function as buffers against stress, and support relationship satisfaction and stability. Generally speaking, intimacy has been perceived to be beneficial and an ideal toward which to strive. However, some scholars wonder whether there is a “dark side” to intimacy, recognizing that partners do not always desire or may not be capable of the same degree of closeness (Mashek and Aron 2004). Others challenge the intellectual dominance of the North American construction of the self as an independent entity who voluntarily seeks connection and closeness. Intimacy looks different from the perspective of interdependent constructions of the self found in many West African settings where interconnectedness with others is a given (Adams et al. 2004). From the perspective of these African contexts, North American expectations of intimacy are seen to unhelpfully destabilize practices common to this region such as arranged marriage, polygamy, and the need for protection from enemies and evil spirits. When viewed cross-culturally, the presumptive psychological “goodness” of intimacy becomes more ambiguous.

Aspects of the Judeo-Christian tradition include some of this same ambiguity about the role of intimacy. On the one hand, relationships celebrated as intimate ones abound in the Bible’s first and second testaments. Biblical commentators consistently refer to the relationship between David and Jonathan, Ruth and Naomi, the ambiguous lovers in Song of Songs, and Jesus and the disciples, especially the Beloved Disciple, as intimate ones. On the other hand, these same relationships can be seen to challenge, even subvert, past and sometimes current social norms in provocative ways.

For those who believe in a “personal God,” the emotional dynamics that characterize human

relationships find an analogy in the relationship between human beings and God. In the words of Old Testament scholar, Renita Weems, “I suppose you can say that everything I know about God I have learned in the muck of intimate human interchange” (Weems 1993, p. 11). Some scholars and theologians maintain that the emotionally charged encounters between persons and God constitute a form of intimacy, one that although never fully mutual or even completely “safe,” still bears the earmarks of friendship (Lapsley 2004). Moses, the patriarchs, prophets, and the psalmists provide prototypes for this kind of intimacy with God. As Luke Timothy Johnson underscores, “spiritual intimacy is intimated but not adequately expressed by those passages in the New Testament that speak of Christians being ‘in Christ’ (I Thess. 4:16; 1 Cor. 15:22; 2 Cor. 5:17; Phil. 2:1; Col. 1:2) or of Christ being ‘in them’ (Col. 1:27; Eph. 3:17)” (Johnson 1999, p. 69). Teachings and images such as “Abide in me as I abide in you” and “I am the vine, you are the branches” (John 15: 4–5) serve to break down barriers and invite intimacy between Jesus and those who follow him.

In Christian theology, the doctrines of the Trinity and of the Incarnation rely on notions of intimacy. A *perichoretic* or social understanding of the Trinity refers to an intimate, interpenetrating “dance” among the three persons, one which some see as providing a guiding image for human relations as well (LaCugna 1992; Moltmann 1981). The relationship between Jesus’ divinity and humanity that lies at the heart of the Incarnation also reflects a unique intimate union that remains shrouded in mystery despite centuries of doctrinal explication.

Connections between knowing and loving and knowing and sexual intimacy are motifs that recur through both testaments as well. In the worlds of the Bible and in common human experience, knowing and being known result in a certain kind of vulnerability which makes one susceptible to being exploited and betrayed by this same knowledge. Intimacy entails risk for all involved. The need to protect participants from the risks of intimacy especially when power differentials exist has resulted in a body of literature in pastoral care and counseling circles about the

importance of maintaining ethical boundaries (Ragsdale 1995). All therapists, but spiritual care-givers in particular, are uniquely charged with staying conscious about the intimate nature of their care for persons who confide in them. Thus as noted in the *Dictionary of Pastoral Care and Counseling* (Madden 1990/2005), there is a place for distance and the maintenance of safe boundaries as part of “risk management” in care-taking relationships.

In conclusion, intimacy comprises one of the most meaningful dimensions of human relationships and, for many, lies at the heart of religious experience as well. Researchers in various psychological disciplines seek to ever more fully delineate the contours of intimate interactions and relationships along with factors that enhance or inhibit its expression. These findings can helpfully inform clinical and pastoral interventions. They may also illuminate fresh aspects of biblical narratives and of persons’ relationship with the Thou who is God (Buber 1970). In turn, the I-Thou depiction of the intimacy that can exist between persons and God and between persons believed to be created in the image of such a God, may enrich and relativize scientific understandings of intimacy. Religious sensibilities remind those who study intimacy, of the ultimately mysterious, meaningful, and wondrous nature of intimate encounters and push against the demarcations and precise definitions that science seeks to establish. The truth and power of intimacy lies at this intersection of scientific specialization and that which presses toward relational integration and the search for transcendent and embodied union.

Introversion

Adele Tyler

Life Journeys, Nashville, TN, USA

A psychological term formulated by Carl Jung in his book *Psychological Types* to describe the flow of psychic energy inward, toward the inner world of ideas and emotions or “subject.” The word introversion comes from the Latin *introvertere*, meaning to turn inward. Jung theorized introversion and its opposite, extraversion, to explain the two fundamental and innate attitudes of people toward the outer world or “object.” Introversion and extraversion describe theoretical polarities on a continuum, with all persons using some degree of both attitudes in reality. Jung defined introversion as a withdrawing of psychic energy, or libido, from the object into the subject. People with a preference for introversion both use and renew their energy by focusing inward and can feel drained by focusing energy on the outside world. Some general characteristics of introversion include a preference for solitude and solitary activities, for one-on-one and small-group interactions, and for listening more than talking; an ease with concentration; and a reserved nature. Introverted forms of religious expression seek the God within and the inner spiritual journey through practices of reflection and contemplation like meditation, solitary prayer, and study of the written word alone or in a small group.

Intuition

Nathalie Pilard

King's College, School of Divinity, University of Aberdeen, Aberdeen, UK

The largest place conferred on intuition by the modern psychologists belongs to C. G. Jung. The notion had several meanings in his production depending on whether intuition belonged to Jung's psychology of consciousness, to his psychology of the unconscious, or to his interest in religion and esoterism as an expression of religious movements or of extraordinary gifts.

Extraordinary Intuitions: Visions and Revelations

"Intuition is a function of perception which includes subliminal [i.e., unconscious] factors, that is, the possible relationship to objects not appearing in the field of vision, and the possible changes, past and future, about which the object gives no clue" (Jung 1936/1960, para. 257). The function of intuition allowed, for everyone, the perception of the possibilities inherent in a situation. For more intuitive individuals, this perception could become a *Ahnung*, which meant both the presentiment of future events and the premonition of things unknown, secret, or mysterious. "Visions" belonged to this category, whereas "revelations" were closer to the German term *Einfall*, which described the way ("fallen") one intuition suddenly arose in consciousness. Paul's sudden conversion to Christianity in his way to Damascus was a revelation, but the voice – enumerating complex alchemical principles – heard by the gnostic Zosimus was a *Ahnung*. The *Einfall* had reached its end in consciousness, giving a "hunch" or a sudden clarity to a content, such as Paul's faith. By contrast, the *Ahnung* lays between the unconscious and consciousness, allowing the perception of a content not clearly – or not yet – differentiated from other ones, such as Zosimus's potential alchemy.

Jung's *Seven Sermons to the Dead*, written in 1916, has been seen and studied as a vision of his whole future work (see Maillard 1993). This episode proved to be the climax of Jung's years of confrontation with the unconscious. The description Jung made of this period in his autobiography *Memories, Dreams, Reflections* revealed this visionary aspect. Jung writes: "The years when I was pursuing my inner images were the most important in my life," – in them everything essential was decided. It all began then; the later details are only supplements and clarifications of the material that burst forth from the unconscious, and at first swamped me. It was the *prima materia* for a lifetime's work (Jung 1961/1995, p. 225). This *prima materia* was a *Ahnung*, it would require to be clarified in consciousness, but it was so strong a vision that it would represent Jung's whole psychology.

Intuition as Type and Function of Consciousness

Psychological types constituted Jung's main work of his psychology of consciousness. There Jung made intuition foundational by elevating it to one of the four basic functions next to thinking, feeling, and sensation. Which function one most relies on constituted the individual's psychological type, such as the intuitive type. A type characterized the dominant psychological attitude (*Einstellung*) of consciousness. It was "an *a priori* orientation to a definite thing . . . a readiness of the psyche to act or react in a certain way" (Jung 1921/1971, para. 687). The intuitive type could be either extraverted, directing his intuitions onto external objects – for example, being attracted to anything new and in the making – or introverted, thereby prone to remain strongly attached to internal visions. Seers and prophets belonged to this second category.

Jung distinguished intuition from instinct, fantasy, fantasies, and empathy. The fact that "all psychic processes whose energies are not under conscious control [we]re instinctive" (Jung 1921/1971, para. 765) disqualified intuition from being the same as instinct. In consciousness, intuition

was a function which made assimilate a content – even new and sudden – whereas instinct remained an impulse. “Fantasy” or “imagination” was, for Jung, the general expression of psychic life and had no other specific meaning when used as a single term and in the singular. “Fantasies” were also distinct from intuitions. While one made fantasies, one had intuitions. Fantasies were artificial and required reason. Intuitions were natural. They were given direct perceptions beyond reason. “Empathy,” for Jung, defined in consciousness, a form of extraversion well rendered by the German term *Einfühlung* (*ein*: in; *fühl*: feel). One felt oneself in an external object or projected one’s feeling onto the object – projecting one’s own fears or likings onto someone else, for instance. There empathy did not involve intuition, but occasionally, Jung used the term *Einfühlung* to describe an intuitive capacity required for the interpretation of dreams.

Intuition and Archetypes

Beyond consciousness, lay the instincts and the archetypes, to which intuition was attached. In the collective unconscious, “intuition is a process analogous to instinct, with the difference that whereas instinct is a purposive *impulse* to carry out some highly complicated action, intuition is the unconscious, purposive apprehension of a highly complicated situation” (Jung 1919/1960, para. 269). “Apprehension” was the key word that linked intuition to archetype. Archetypes were inborn “forms of intuitions,” but the exact German expression *Archetypen der Anschauung* is better explained than approximately translated. *Anschauung* characterized, in this context, intuition as one’s apprehension, a perception by way of the unconscious, by one’s ability of representation, of perceiving everything imaginable and everything in images. Translated into the standard single term “archetypes,” the locution *Archetypen der Anschauung* loses a significant part of its meaning. It omits the dependence of archetypes on intuition revealed by the genitive. Correctly understood, the expression thus avoids any association of the

archetype with any inherited image that the ancestor of the term, the “primordial image” (*Urbild*), might have suggested. As a capacity to represent, *Anschauung* inherently attached to archetypes depicted an *a priori* tendency, a *facultas praeformandi*, rather than the forms themselves.

In the collective unconscious, archetypes differed from instincts as “archetypes [we]re typical modes of apprehension,” whereas “instincts [we]re typical modes of action” (Jung 1919/1960, para. 273, 280), the manifestations of which were always regular and recurrent. In both cases, however, *Anschauung* was required to reach consciousness. Later, Jung would even assimilate instincts to archetypes as not differentiable entities of the collective unconscious.

From Empathy to Synchronicity

In Jung’s psychology of the unconscious, the term *Einfühlung*, empathy, had a different meaning than in his psychology of consciousness. Whereas *Anschauung* linked archetypes to a differentiated consciousness, *Einfühlung* described a link close to identity between the collective unconscious and varied forms of not differentiated consciousness. The first form depicted the “primitive,” who lived in a state of almost unconsciousness by identifying himself with the nature or with ancestors as a mechanism of defense. Jung also studied two other, more elaborated, forms of *Einfühlung* through the experiencing of the annulment of the other. They both concerned esoterism, in its historical religious sense. Psychologically, absolute disregard of the ego was the aim of certain oriental meditations; voluntary identification of the ego with the collective unconscious was the aim of mysticism. In these two cases, mind and body were trained to become themselves the invisible tool intuition and consequently the sheer receptacles of the archetype in consciousness. The frontier between the archetype and consciousness could also be reduced in the phenomenon of synchronicity (see entry). This time, intuition did not fall into consciousness in the form of a feeling (the dreadful effect of numinosity), but of a

“meaningful coincidence” which challenged thinking and the law of causality.

Intuition in Jung's *Answer to Job*

Intuition is a key to understanding the role accorded by Jung to Sophia and to the Holy Spirit in his *Answer to Job*. The symbol of God, or *Imago Dei*, evolved from God the Almighty, to Jesus, to the Paraclete, and to humanity. Between the composition of Job and that of the New Testament, Sophia appeared in many writings in many parts of the world. Peoples longed for her Wisdom in front of God's power. Sophia personified in the unconscious the changing consciousness of the end of the previous era, the intuition of new times. She was pregnant with the unconscious hopes of the peoples. Ancient civilizations had projected their patriarchal culture onto the image of an omnipotent God, leaving His first fiancée stayed in the background, as a latent archetype. By reappearing in the writings, Sophia became the function of intuition which would reunite the unconscious to consciousness. She would fall into her symbol in consciousness Mary, to give birth to Jesus, thereby intuitively creating and enabling the perception (*Anschaunung*) of the new symbol of God.

From the unconscious to consciousness, the drama proceeded. The Holy Spirit, symbolized by the Paraclete, continued to ensure the link between the Self – the eternal God – and the evolving self of humanity. The Holy Spirit reduced the gap between Christ (divine), unique son of God, and the God incarnated – realized – in each human, who, like Job, gave God the “conscience” that God had not had. Once God incarnated, each “son of man” had to realize the power of the god within. The H-bomb opened the era of man the almighty, who became responsible of his fate. Man received the duty of the power and the truth of his intuitions. The Holy Spirit and Sophia were neither God nor human – neither the archetype nor its future symbol – but the factor which reunited the two: intuition. They were the entity expressing the hitherto unconscious will of people to get involved in the divine

drama. For Jung, religion, rather than disappearing in contemporary times, became conscious.

Intuition and Mandalas

After his rift with Freud, Jung's confrontation with the unconscious gave birth to the method of active imagination (see entry). Intuitively driven, Jung drew circles to reunite his consciousness to the unconscious. Jung had then the same intuition as his cousin Hélène Preiswerk, when she had held the role of medium during spiritist sessions. In his medical dissertation, Jung had studied the psychological meaning of the trances of Hélène. During the last sessions, she had had the intuition, the clairvoyance, of a “gnostic system.” She had drawn circles representing a higher and higher level of gnose (knowledge of ultimate realities), the content of which she could not have possibly read or heard of. These circles were the intuition of her next stage in life: adulthood, such as these drawn by Jung intuited his own psychology freed from Freud's theory.

Jung would later recognize these figures as *mandalas* – the oriental religious symbols of unity, emptiness, and resolution of opposites – and see them as one of the best symbols of the Self. The religious function of the psyche described a specific moment of the method of active imagination, when the third term, the symbol such as Jung's and Hélène's *mandalas*, was created from the opposition between consciousness and the unconscious. The tension at once revealed and created the symbol, which intuitively understood, led to a new level of comprehension. In *Memories, Dreams, Reflections*, the last *mandala* painted by Jung appeared at the end of the chapter “Confrontation,” just before the chapter “The Work” (Jung 1961/1995, p. 224). *Mandalas* were intuitive symbols which led Jung to his next stage: work. The religious function of the psyche and Jung's historic-psychological interpretation of religion through *Answer to Job* depicted religion as official or secular, or even personal, but always as an experience where intuition was involved.

Isaiah

Matthew B. Schwartz¹, Kalman J. Kaplan² and Paul Cantz³

¹Department of History, Wayne State University, Detroit, MI, USA

²Departments of Psychiatry and Medical Education, University of Illinois in Chicago, Chicago, IL, USA

³Department of Psychiatry, University of Illinois at Chicago College of Medicine and Adler School of Professional Psychology, Chicago, IL, USA

The Book of Isaiah in the Hebrew Scriptures presents the prophecies of Isaiah, an eighth-century BCE Israelite prophet. The book in the form we have today was known to the Jewish writer Ben Sira by 180 BCE and has been found among the

Dead Sea Scrolls. The Christian New Testament makes much use of Isaiah, notably John 12.38, “spoken by the prophet Isaiah.” Jewish tradition holds that the book consists of the prophecies of Isaiah, written into book form by King Hezekiah of Judah and his scholars (*Talmud*, Bava Batra 15a). Rabbinic tradition accepts the book of Isaiah as the work of one prophet, although Abraham Ibn Ezra (twelfth century) suggests that some of the later chapters may be from a different hand. Some of the prophecies may have been written down by Isaiah himself (8.1).

Modern Bible criticism beginning with German scholars of the 1780s generally supports the view that the book is the work of two or more people, dividing most sharply between chapters 1 and 39, which deal largely with events and conditions of the late eighth century, and chapters 40–66 which deal with the Babylonian exile of the sixth century and the more distant future even into the messianic era. Today terms like Deutero-Isaiah and Trito-Isaiah are commonly used to designate different parts of the book. Judeo-Christian religious tradition still largely maintains its belief that the Book of Isaiah was wholly the work of one prophet (Friedman et al. 1971, p. 45).

Isaiah’s prophecies began ca. 740 BCE, the year of King Uzziah’s death (or illness), and continued through the reigns of Kings Jotham, Ahaz, Hezekiah, and possibly Manasseh in the early seventh century. Tradition holds Isaiah to have been of the royal family, and his lofty style is contrasted to the more down-to-earth style of Jeremiah, who grew up in a small town (*Talmud*, Megillah, 10b).

The period of Isaiah’s work saw a change of course in Judah and in the Middle East in general, as an aggressive imperialistic Assyria expanded its power and conquests. Feeling threatened by his neighbors, King Ahaz of Judah made himself subservient to the Assyrian emperor Tiglath-Pileser. Later his son King Hezekiah rebelled against the Emperor Sennacherib, who invaded Judah and laid siege to Jerusalem in 701 BCE. The book relates that Hezekiah went to the Temple to pray, and God sent Isaiah to the king with the message that the Assyrians would not “enter the city neither shall he shoot there an arrow. . .”

(Isaiah, 37:34). Sennacherib's army was smitten by a plague, and he returned to Nineveh, his capital, where he was assassinated by his own sons (Isaiah, 37:38).

Isaiah's call to prophecy is described in the magnificent vision in chapter 6. Praying in the Temple, Isaiah saw, as it were, God seated on His throne, hovering over the Temple as though departing from it and surrounded by hosts of angels. When God called for someone to bear His message to the people, Isaiah answered "Here I am. Send me." When Isaiah hesitated on the grounds of dwelling among a people of unclean lips, God sent a seraph to bring a coal from the altar to touch to Isaiah's lips, both to reassure him of divine support and to indicate that the spiritual fire had not yet totally gone out, although diminished, and also that Isaiah should be careful how he spoke of his people.

A central theme of Isaiah's work was to reawaken the feeling for God among a people who had become dulled and spiritually unmotivated. People had begun to take the Temple for granted; paying their dues to its upkeep but life could have full meaning only if the entire world and not just the Temple would be dedicated to God. The description of God as hovering above the Temple can be seen as a sign of God beginning to remove Himself from it. It is critical to emphasize that in no sense did Isaiah reject or invalidate the Temple or its rites. He criticized only the people's tendency to complacency (Isaiah, 66:3 and 1.11–15; Hirsch 1997, pp. 98–99). Another important theme is Isaiah's castigation of injustice and immorality (e.g. Isaiah, chapters 1, 3, 5, and 7) and his reprimand of those who conspired with his people's enemies (Isaiah, 8:5–18).

Chapter 1, the *chazon*, or vision, again calls attention to the decline in spiritual awareness. Even the ox and the donkey are aware and grateful for the master and for his corn crib from which they eat, but the Judeans lack awareness of God and His bounty to them. Israel was to be a nation of God's Law and God's will, ready to teach God's message to the world. Yet they have become estranged from God. They cannot see that their materialism is causing their land to decay. They are losing their way and can hardly

sense the differences between their religion and the idolatrous cults of their neighbors. The Temple service is wonderful but has no meaning unless it is carried on with true commitment and feeling.

Isaiah often expresses the view that politicians and kings may think they run the world, but the world is in fact God's. The difference of view is made dramatically clear in the story (Isaiah, 7–8) of Isaiah's meeting with King Ahaz. Judah was threatened by the Kings Pekah ben Remaliah of Israel and Rezin of Syria. Bringing along his young son Shear-Yashub, Isaiah met with the king in the Washers' Field to convey the message that God would protect Judah and that Ahaz need neither fear invasion nor seek an Assyrian alliance. The king, however, would not listen at all and rejecting an offered sign of divine support made a treaty with the Assyrians, who welcomed the pretext to come and conquer both Israel and Syria. However, once invited into Judean affairs, the Assyrians stayed until they invaded Judah too, not many years later in Hezekiah's time.

Eventually the Babylonians conquered Israel and took most of the people into slavery in Babylon. Isaiah 40 opens a new series of prophecies in which Israel is comforted after its long Babylonian exile (587–539 BCE), which will be seen as an important if painful learning experience. The Persian King Cyrus freed the Jews from Babylon to return to Israel, where they began to rebuild the Temple, as the Bible records in the books of Ezra and Nehemiah. Israel will have learned from its tribulation and will be imbued with the consciousness of its historical mission. In all the uncertainties of history and diaspora, God will remain the shepherd of His people, and He will not let the world go unfulfilled. Nations will find meaning in their recognition of God, for it is He who rules history and before whom princes and judges are as naught.

Chapter 42 depicts God as having created the world and still creating it. He will hold Israel's hand and guide it toward perfecting His ideal of righteousness. All will recognize and give honor to God, and human leaders who misused their power will cry in pain and fury. Israel will be a state founded on divine laws of morality and not mere power and force. The prophet goes on to talk

at length about the messianic future. The final prophetic vision, chapter 66, paints the future when all humankind will go hand in hand dedicating themselves to God (Isaiah, 66:19–24).

Isaiah's vision has important psychological implications. He continuously calls for the integration of sincere spiritual depth with practical behavioral actions. Concrete symbolic actions do not substitute for ethical behavior, but they are not to be disregarded either. This integrated view represents a centerpiece of Judaism's emphasis of the interconnection of inward emotional life and outward actions. In this way Judaism is often said to be a religion of deed rather than intention. This understanding of Judaism as a religion of action is encapsulated by the biblical verse in which the Jews standing at Mount Sinai signal their acceptance of the Torah with the words *"na'aseh v'nishma"* – "We will do and we will hear/understand." In other words, the Jewish people promise first to observe the laws of the Torah and only afterward to study these laws. In traditional Jewish culture, this statement has come to epitomize the Jewish commitment to concrete actions rather than simply underlying intentions.

Isaiah's integrated view has received full expression in the simple yet profound sequence in *Fiddler on the Roof*. When Tevye asks Golde, his wife of many years and mother of his children, "Do you love me?" she at first responds incredulously. "Do I love you? For twenty-five years I've washed your clothes, cooked your meals, cleaned your house, given you children, milked the cow. After twenty-five years, why talk about love right now?" However, Tevye persists "I know. . . But do you love me?" Golde muses out loud: "Do I love him? For twenty-five years I've lived with him, fought him, starved with him. Twenty-five years my bed is his. If that's not love, what is?" Tevye again asks: "Then you love me?" Golde responds "I suppose I do." Tevye, finally satisfied, responds in kind: "And I suppose I love you too."

Though overly simplistic, this description reflects the centrality of *mitzvot* (commandments) in Jewish life, as well as the rabbinic conclusion that, in most cases, a person who performs a mitzvah without focusing on its

significance has nevertheless fulfilled his or her religious obligation at least partly.

One must ask oneself if a starving person really is more concerned with a passerby giving him food or the purity of his motives in feeding him. The answer is obvious, and overconcern with one's spiritual life at the expense of helpful behavior toward another implies a narcissistic self-absorption very far from Isaiah's vision of a healthy integration of spiritual depth and concrete actions and the beautiful interchange between Tevye and Golde described above.

This view has greatly influenced psychological theories such as cognitive dissonance theory postulated by Leon Festinger (1957), emphasizing the drive to consistency between outward behavior and inner attitudes and beliefs. This integration is critical to a healthy view of human psychology, rejecting on the one hand empty ritual but on the other hand spirituality devoid of practical behavioral consequence. For Festinger, change in behavior will likely lead to a change in underlying attitude, because of a need for the behavioral manifestations of an act to be affectively and cognitively consistent with one's inner life.

Isis

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Isis was originally an independent Egyptian goddess in the predynastic era in the Nile Delta, prior to 3100 BCE. She was daughter of Geb (Father Earth) and Nut (Mother Sky). She was brought into the Heliopolitan tradition with Osiris, Set, and Horus. She was a great Mother Goddess and Savior. She is portrayed with her brother-husband Osiris, or having large wings and a crown of a disc between cow's horns, or seated as a mother suckling her infant son Horus, the archetypal origin of all Pharaohs. She protected children and could appear as a kite bird (Fig. 1). There are various versions of their mythology, and this is a condensed one.

Isis helped Osiris give people civilization. As Earth Mother, she taught people agriculture, instituted marriage, the arts of grinding grain, spinning flax, and weaving. She was a great Enchantress, knowing magic and medicine, that she taught humanity. There are many versions of their myth; this is a common one: Osiris' jealous brother Set was a wicked god of the desert. One night at a banquet, Set displayed a decorated chest that was made to fit only the king. Several tried,

but only Osiris could fit exactly. Then Set and his minions slammed it shut, nailed it tight, and threw it into the Nile.

Isis was distraught at this wicked sibling rivalry and grieved mightily. She cut off half her hair, and began the search for her beloved husband's body. Some children told her they had seen it floating toward the Sea. A revelation told her that it had floated north to the city of Byblos in Phoenicia. There a great tamarisk tree grew around it. The King had cut down the tree for a pillar in his palace.

Isis came to Byblos, where the Queen Astarte had given birth to a son. Isis was appointed to be the nurse of her newborn son, and at night she secretly held him above the fire's flames to magically burn away his morality and make him divine. But she was discovered by Queen Astarte, who was furious. But great Isis revealed her true identity. The King cut down the tree and gave it to Isis, who cut it open and found Osiris' coffin. She fell upon it weeping. The King gave Isis a ship to return to Egypt. By her magic she and Osiris conceived in her the child Horus, so Osiris would have an heir to take the throne. On her return to Egypt, Isis took the coffin to a hiding place in the marshes, to hide from Set. But wicked Set discovered them and again attacked Osiris. This time he cut Osiris' body into 14 pieces and scattered them up and down the Nile. Grieving

Isis, Fig. 1 Isis with wings of one of her forms, a kite bird. (Art courtesy of the author, 2002. Public Domain)

mightily again, Isis set off searching for Osiris' body. She found all parts except his phallus. At each place where she found part of his body, a temple was built. Isis modeled a phallus substitute and, with the aid of her sister Nephthys, reconstituted Osiris' body and anointed it with precious oils, thus performing the first ritual of embalment. For Egyptians, the soul depended upon the body for resurrection. Thus, Osiris was restored to become the Lord of Eternal Life. Isis managed to evade Set and gave birth to Osiris' heir Horus, who regained the throne from Set. Each night Osiris steered an underworld bark below the Nile, taking the dead to the afterlife to be judged. Isis was often pictured with him, protecting the dead with her wings.

Psychologically, Isis gave strength to the many archetypal patterns of women's lives: she symbolized the mythic primordial Mother Earth who protected children; aided those who prayed to her, rich or poor; taught the arts of civilization, from farming to healing magic; faced evil, struggled to keep her family together. Isis suffered the loss of her beloved to his wicked jealous brother, grieved, and brought him home. She mothered her son Horus and protected and nourished him to become the first Pharaoh. She resurrected her beloved Osiris, not to earthly life, but, since he was a god, he returned to be the Lord of the Dead in Eternity. Thus, she modeled many archetypal patterns, from strong Mother Earth to suffering wife, mother of a fine child, Queen, and powerful goddess of resurrection and salvation, overcoming grief, evil, and earthly death.

Islam

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

Islam (Arabic "submission") aligns itself with the monotheistic religions of Judaism and Christianity and the belief in the prophets whose attestation to the sovereign, ongoing and active purpose of the one God: "We believe in God and that which was revealed to us; in what was revealed to Abraham, Ishmael, Isaac, Jacob, and the tribes; to Moses and Jesus and the other prophets of the Lord" (Sura 2:135). It is founded upon a succession of religious vision experiences by Muhammad (b. ca. 570 CE), a poor and probably illiterate Arab who struggled through much of the first 40 years of his life. Around 610 CE while meditating in a cave in Mount Hira near Mecca (Saudi Arabia), he receives revelations from the angel Gabriel. The angel "who is powerful and mighty" (Sura 53.5) imparts the "Book" into the heart of Muhammad who is instructed to '*iqra*, "recite" (*Al-Quran*, "The Recitation"). Through the encounter Muhammad understands himself to be an emissary of God as the last and greatest of the Judeo-Christian prophets. He attracts a small following and eventually the hostility from the wealthy merchant class, causing him to flee to Yathrib (Medina) north of Mecca. His flight (*hegira*) marks the starting point of the Islamic calendar (16 July 622). The Koran consists of a collection of a range of teachings having to do with faith, religious ritual practice and worship, and codes of behavior for day-to-day life. The work is arranged in sections called "Suras" so as to impart "gradual revelation" (Sura 17: 106). As the "*Book of Revelations*," it includes "good news and warning" (Sura 41: 2). A range of subjects receive attention such as Kneeling, Muhammad, The Moon, The Dawn, Clots of Blood, Alms, The Poets, and Women. For "true believers" the Koran is a balm and a blessing, while for the "evildoers" it is "nothing but ruin" (Sura 17:82). For those who do not adhere to Islam, their deeds will be

brought to nothing (Sura 47:1). Those who do believe are promised Paradise to enjoy divine forgiveness, every kind of fruit, rivers of purest water, ever-fresh milk, delectable wine, and clearest honey (Sura 47:15). Those who follow base desires will reside in hell eternally drinking “scalding water which will tear their bowels” (Sura 47:15–16). According to the Koran, Satan seduces those who once received divine guidance but have opened themselves to those who abhor the Word of God. These ones will lose their souls (Sura 47: 26–27). Unlike various religions including Judaism and Christianity, Islam does not evidence the development of ecclesiology or a priestly hierarchy. Rather, its requirements for piety and attention to revelatory experience especially through the mellifluous intoning of Koran verse are collective practices which inherently resist the formation of institutional structure and dogma. Believers are expected to practice a disciplined, conscious life of patience and prayer: “Turn your face towards the Holy Mosque; wherever you be, turn your faces toward it” (Sura 2:144). They are to recite prayers at sunset, at nightfall, and at dawn and to pray during the night as well (Sura 17:78). Each is to show kindness and give alms and make regular pilgrimage to Mecca during which time abstaining from sexual intercourse, obscene language, and argument (Sura 2:197). Islamic culture is known for its contribution to alchemy especially through the work of Muhammad ibn Umail at-Tamimi, known as Senior. A Muslim Shiite, he lived and worked during the tenth century. His *De Chemia* (*On Chemistry*), translated into Latin during the twelfth or thirteenth centuries, describes Senior’s entry into what he calls a *barba* – an Egyptian pyramid tomb in his quest for the alchemical secret. There he and his colleague see amid the “fiery prisons of Joseph” (*carceres Ioseph ignitas*) a statue in the middle of the chamber sitting on a throne and holding a tablet (*tabula*). The images of the sun and moon on the tablet relate ancient Greek notions of the processes of the *coniunctio*, the coincidence of opposites. The text reflects Islamic interest in Egyptian mummification as the source of alchemy. It also evidences parallels with the ancient Emerald Tablet (“all things were

made from this one, by conjunction; the father is the sun, the mother is the moon”) attributed to the Egyptian god Thoth and Greek god Hermes Trismegistus. *De Chemia* shows the significant role Islam played in the interpretation and transmission of religious ideas and symbols from ancient Egypt, Greco-Roman, and medieval cultures into the time of the Italian Renaissance and the work of figures including Roger Bacon and Isaac Newton. Al-Razi (ca. 850 CE-ca. 924 CE) and Jabir ibn Hayyan (ca. 721 CE-ca. 815 CE) also play important roles and make significant contributions in Islamic-Arabic alchemy and the pursuit of the elixir. Out of the work of each issues an interest in healing properties of “strong waters” (corrosive salts) eventually influenced Arabic medicine and being translated into Latin Europe in the twelfth century.

Islamic Care and Counseling

El-Sayed El-Aswad

Department of Sociology, United Arab Emirates University, Al-Ain, United Arab Emirates
Bloomfield Hills, MI, USA

This entry tackles a critical topic encompassing such interrelated themes as Islamic counseling, psychotherapy, and Arab/Muslim traditional culture. It endeavors to bring to attention the impact of sanctified and non-sanctified worldviews on the practice of counseling among Muslim communities in various local, national, and transnational contexts.

According to the Merriam-Webster dictionary, counseling means “professional guidance of the individual by utilizing psychological methods especially in collecting case history data, using various techniques of the personal interview, and testing interests and aptitudes.”

Islamic care and counseling is fundamentally contingent on theological, ethical, and social principles that are explicitly and implicitly found in the Holy Book (the Qur'an) and the tradition of Prophet Muhammad (Sunnah). Historically, Islamic care and counseling is characterized by both formal or professional and informal practices within both individual and group sessions.

Formal Islamic Counseling

Islamic care and counseling with its contemporary counseling skill set is considered a formal discourse, comparable with counseling knowledge and methods practiced and implemented in western countries. Islamic counseling is a process in which the counselor helps people to understand the causes for their problems and guides them through the process of knowing or learning how to make effective decisions and changes. Islamic professional counseling and psychotherapy are closely related disciplines as far as they work to help clients and assist them to understand factors causing psychological and emotional disturbances (Dwairy 2006).

Islamic care and counseling relates to various forms of Islamic knowledge and practices such as Islamic education, preaching, theology, and ethics. Islamic counseling is practiced in many formal settings such as mosques, centers, and clinics among other Islamic institutions. The objective of Islamic counseling is to assist Muslim patients or clients in enhancing their theological understanding and empowering their abilities to deal with personal and public challenges.

Clients, differing in gender, age, educational, and socioeconomic levels, are aided to attain positive changes in their lives within the framework of Islamic worldviews. The application of Islamic care is not only required in counseling individuals but is also important in group counseling.

Religious, cultural, and social differences are critical in dealing with clients (El-Aswad 1990). For instance, counselors and therapists who work with Arab and Muslim clients realize the profound impact of the family, heritage, culture, and religious beliefs on the clients (Dwairy 2006, p. 3).

There is a strong association between religion, spirituality, and empathic understanding (Giordano et al. 2014). Empathy is a foundational skill in the counseling process. Muslim counselors spare no effort to promote empathy as well as the ability to enter into their clients' inner worlds.

Many Muslim spiritual caregivers engage in therapeutic relationships (which are also parts of the practice of psychotherapy) with their clients by assessing, treating, teaching, and educating Muslims in a health care setting or prison settings (Isgandarova 2014). Quranic verses, sayings of the Prophet (*Hadith*), and popular proverbs are used to facilitate relevant therapeutic outcomes. In addition, Islamic values such as patience, trust in God, fairness, reliance on God, acceptance of God's will, contemplation, and tranquility are taken for consideration in treating clients (Hamjah and Akhir 2014, p. 287).

Professional Islamic care and counseling is not confined to Muslim-majority countries. It is also practiced among Muslim communities living and residing in western countries. Many Islamic universities, Islamic medical centers, and training institutes in Europe provide mental health certificate courses that are awarded accredited qualifications. For example, the Dutch accreditation authority in the Netherlands has granted such a qualification to the Islamic University of Rotterdam for an MA program in Islamic Spiritual Counseling. Likewise, many colleges in the UK such as the Cambridge Muslim College, Muslim College in London, offer a Certificate in Islamic Counseling Studies, which is accredited by the British Counseling and Psychotherapy Central Awarding Body (Isgandarova 2014; Gilliat-Ray et al. 2013).

Specific institutions of Islamic counseling have created online services reaching broad clients and receivers. Muslim websites allow people constituting a large number of online consumers in the

USA to partake freely in discussing certain aspects of Islamic counseling. These websites encourage clients and receivers to be active in feedback, interaction, and dialogue. Institutional websites concerned with Islamic counseling provide both information and more interactive spaces where various issues and topics including, for example, health, emotional stress, marriage, divorce, alienation, drugs, and domestic violence, are delivered and negotiated. Some sites are discussion groups, while others offer advice on religious matters including doctrinal, legal, ethical, and social issues. For example, the Islamic Online University, offering online, intensive, undergraduate, and graduate programs that are completely tuition-free, provides various kinds of Islamic counseling services. It defines Islamic counseling as “vital because it provides an unbiased perspective, and professional guidance.”

In the USA, American Muslims take the information revolution with its varied resources, online, cyberspace, cell phone, and other electronic means of communication, very seriously (El-Aswad 2012, p. 122). They are involved in a continuous process of dual assessments through which they evaluate both Islamic counseling and other forms of counseling.

Informal Islamic Counseling

Although informal counseling does not constitute the professional counseling that is practiced in western countries, it offers significant healing and therapeutic practices. Several case studies conducted in Middle East countries, India, and Indonesia support this statement (El-Aswad 2002; Dwairy 2006; Hamjah and Akhir 2014).

Informal Islamic counseling relates to ritual healing practices in which a religious leader (*imam*, *‘alim* or *shaikh*) provides advice and performs rituals for the purpose of helping individuals or groups of people. A religious leader is a person known for his religious knowledge, whether it is acquired through formal religious education, or through self-education. The religious leader or *shaikh*, possessing information that, by definition, his followers may neither

possess nor fully understand, plays an important role in Muslims’ religious life by leading prayers, teaching the principles of Islam, and advising people in mundane and religious matters. People seek the *shaikh*’s help in solving problems that range from medical issues such as sickness, barrenness, impotence, and injuries to religious, sociocultural, psychological, and economic issues such as distribution of alms, marital disputes, mental troubles, lost or stolen property, and protection from evil spirits or malicious magic made by sorcerers and evil doers. The *shaikh* works as a medicine man, using, for example, his hand along with some verses of the Qur’an in writing charms, *ahjibah* (sing, *hijab*), among other things, to protect and cure people and animals (el-Aswad 2002, p. 136).

Different religious and social issues are addressed in what is known in Muslim societies such as Egypt as religious teachings that are not confined to mosques, but are sometimes taught in the homes of religious leaders or their followers where the texts, the holy Qur’an, and the interpretations of scripture are read allowing those present to participate through discussion, argument, and query. It is worth noting that the number of those who attend religious sessions in homes is less than those at mosques. However, home sessions are more intimate and of longer duration than those at the mosque (el-Aswad 2002, p. 13).

Following the principles of Islam and the deeds of the Prophet Muhammad, Muslims are expected to care for their sick family and community members. Visiting and comforting the sick are some of the Islamic virtues practiced by the Prophet Muhammad who used to visit the sick and offer them prayer and words of comfort (Isgandarova 2014, p. 2).

In their daily lives, Muslims apply traditional techniques such as dream interpretation, invocations, exorcism of spirit, and recitations of traditional supplications. For instance, in the case of a sick person believed to be a victim of the evil eye or envy (*hasad*), there are three elements that must work together if that envied person is to be cured. These include the utterance of the appropriate incantation, the use of incense, and the performer, who might be either an ordinary person or a

shaikh known for his *baraka* or blessed hand. Of these elements, however, the performer, especially the *shaikh*, is the most important, because he is thought to be the master of hidden knowledge, with cognizance of efficacious methods for restoring health to those who have been troubled or envied (el-Aswad 2012, p. 122).

The mystical tradition of Sufism (*taṣawwuf*) in Islam is credited with providing the basis for Islamic psychology. Sufi leaders are spiritual counselors and care providers using verbal and nonverbal communication in the religiously and spiritually oriented counseling. Sufi leaders are hierarchically demarcated based on their powers of blessing. Only a few are known for their extraordinary ability to manipulate mystic knowledge for the welfare of the community. The care and counseling offered by Sufis relates to the concept of spiritual brotherhood, which is based on the spiritual ties of Islam, not on blood relationships. Sufi brotherhood, in its spiritual aspect, frees humans from blood and tribal affiliation and satisfies spiritual-social needs in a spiritually barren world. It constitutes a unique tie, transcending egoistic desires by involving individuals in charitable deeds of the Muslim community (el-Aswad 2010, 2012).

Though mystic worldview is not necessarily based on ecstatic experiences, it does not reject or negate such experiences when they occur. In dealing with ecstatic experience, psychological problems, altered states of mind, or spirit possessions, a ritual of *zikr* or *dhikr* (discursive and non-discursive actions of remembrance of God) is recommended by Sufi consultants. In such a case, Sufi members perform the ritual of *zikr* in front of the sick person's house. Participants, standing in two rows and facing each other, perform collectively oral and bodily *zikr*. While moving their bodies toward right, they say "Allah"; toward left, they say "alive." When a sick person goes through ecstatic experience, he is described not as a mad or crazy person but rather as being "mystically attracted" (*majzūb* or *majdhūb*). Mystic experience, subjective and emotional, can be neither literally expressed nor conveyed in regular words. In this context, the *dhikr*, empowered with an inner force, becomes not just a discursive

action but rather a dynamic bodily agent permeating a new state of existence or consciousness. For the Sufis the *majzūb* experience is a beatific and timeless state that can be described as "being taken over by divine gravity" (el-Aswad 2012, p. 83). This transformation of Sufi behavior is thought of as a manifestation of spiritual states. All in all, Sufi or Islamic informal counseling is viewed as an important step toward the development of more professional approaches of Islamic counseling (El-Aswad 2006; Abdullah 2009).

Islamic Psychology

Anisah Bagasra

Department of Psychological Science, Kennesaw State University, Kennesaw, GA, USA

Islam and Psychology

Islam has a rich traditional psychology that encompasses the multifaceted nature of human beings including personality, motivation, stress management, health and illness, and social relations (Abu-Raiya 2014; Athar 1993; Haque 2004; Husain 2006). Some scholars prefer the use of the term Islam and psychology (Kaplick and Skinner 2017) to refer to the study of both psychological concepts drawn from Islamic sources, and the study of psychological concepts within the context of Muslim populations, such as Muslims and mental health, religiosity of Muslims, religious coping, and other areas where Islam and Western psychological concepts intersect (see also “► Counseling and Islam”). The predominant focus of Islamic psychology is on the spiritual, psychological, and moral development of an individual, which can only be achieved by understanding the self and the nature of a human being (Al-Attas 1990; Ansari 1992). Thus, traditional Islamic psychology is heavily rooted in Islamic theological concepts.

The compatibility and comparability of Islamic psychology with Western psychology continues to be debated and analyzed (Razak et al. 2017; Sahin 2013), with some arguing that Islamic psychology is not comparable to Western psychologies, and others drawing a great deal of parallels between indigenous Islamic concepts and

contemporary Western concepts (Akhtar 2008). Within Sufism, the mystical branch of Islam, there has been many parallels drawn between Sufi psychology and Western psychology (Spiegelman 2018; Nurbakhsh 1992; Shafii 1988) with many comparative studies beginning under the umbrella of Transpersonal psychology. Though the term Islamic psychology has and continues to be used when discussing traditional Islamic perspectives on issues related to the human mind and behavior, contemporary Muslim social scientists acknowledge that the term Islamic psychology is problematic. Efforts to establish a consensus on definition for the purpose of both research and practice are ongoing.

Scholarly interest in the application of Islamic conceptions of the human mind and behavior continues to grow. This is reflected in the development of organizations such as the International Association of Islamic Psychology and the Al-Karam Institute for Islamic Psychology, journals such as the *Journal of Muslim Mental Health*, and conferences on Islamic psychology and Muslim psychology. Interest in Islamic conceptions of mental illness (See entry on “► Mental Illness and Religion”), and the integration of traditional Islamic treatments with various psychotherapeutic techniques (See entry on “► Counseling and Islam”) in both Western societies and Muslim majority countries demonstrates the increasing relevance of Islamic psychology (Abu-Raiya and Pargament 2010; York Al-Karam 2018; Ahmed and Amer 2011; Akhtar 2008; Haque et al. 2016).

Ilm al-nafs

A partially equivalent term for psychology in the Arabic language is *ilm al-nafs*. This term has often been translated from the Arabic into English as equivalent to psychology for more than a century. *Ilm* is an Arabic word that is best translated as “knowledge.” *Nafs* has been translated from Arabic in several ways. It occurs in 28 verses of the Quran, and is translated into English as “soul” or “self” in most instances (Chittick and Murata 1994; Husain 2006; Nasr 1999). Some scholars also utilize the English words psyche, ego, or mind when discussing the term *nafs*. As part of

contemporary revival movements in Islam, the term “Islamic psychology” is being utilized to refer to the study of the self within traditional Islamic cosmology. This has been referred to in many circles as the “Islamization of knowledge” (Badri 2000). The *Quran*, the scripture of Islam, the *hadith*, recorded words of the Prophet Muhammad, and the *Sunnah*, actions and deeds from the life of Prophet Muhammad, serve as the foundation of Islamic perspectives on human behavior and mental processes. Husain (2006) summarizes this perspective as an understanding of the human self, both outward and inward dimensions, within the context of Divine law.

The Quranic conception of the self is that of a combination of the dimensions of *ruh* (spirit), the *nafs*, *al-qalb* (the heart), and *al-aql* (the intellect) (Husain 2006). Some scholars combine *al-aql* and *al-ruh* into one, arguing for the inseparability of the mind and soul (Husain 2006). Ajmal (1991) describes four types of *nafs* which can be found within a human being. The first is *al-nafs al-hayawaniyyah*, which is the animal soul that is passively obedient to natural impulses. The second is *nafs al-ammarah*, the egotistical soul. These first two forms of the *nafs* can be understood as similar to Freud’s concept of the Id. They are self-centered and self-serving in their motivations and actions. The third level of *nafs* is *al-nafs al-lawwamah*, or the soul that is aware of its own imperfections. The fourth type of *nafs* is *al-nafs al-mutma’innah*, the soul reintegrated in the spirit and at rest in certainty (Ajmal 1991). These first three levels of the *nafs* are often compared to Freud’s personality theory, corresponding roughly to the roles of the id, ego, and superego. However, unlike the three structures of personality, the *nafs* represent a hierarchical struggle within a human being and are more comparable to Maslow’s hierarchy of needs, with the first type of *nafs* focused exclusively on basic needs, and the second level focused on safety and security and self-esteem needs. The third level of *nafs* has moved towards love and knowledge of the self, and the fourth type of *nafs* is concentrating on self-actualization and spiritual connection with something beyond the self. Understanding the role of the *nafs* is a key concept in Islamic psychology.

Islamic scholars and Sufi teachers representing the mystical branch of Islam, expound upon

the *nafs* in an attempt to explain human flaws. According to Nurbakhsh (1992) the *nafs* operate on many levels, interacting with the material body, the intellect, and the outside environment. The *nafs* serves as the motivational force behind fulfillment of human desires for food, sex, and other wants. According to traditional Islamic thought, overcoming the *nafs* is the major struggle of a human being, in order to connect with God and thus fulfill one’s role as a servant of the Creator. Succumbing to the demands of the lower *nafs* can result in illness, and struggling through the four levels of *nafs* can trigger distress for the individual. This is usually referred to as sickness or disease of the heart. Within the Sufi worldview psychopathology has its root in disobedience to God by following the *nafs* instead of spiritual guidance.

Early scholars of Islamic psychology include al-Razi (865–925), and ibn-Sina, known as Avicenna in the West (980–1030). Scholars focusing specifically on the psychospiritual origins of illness include ibn Taymiyyah (1263–1328), who wrote extensively about “Diseases of the Heart,” which closely correspond to many symptoms found in contemporary psychopathology. Other prominent scholars who addressed the concept of “Diseases of the Heart” include al-Ghazali (1058–1111) and al-Muhasabi (781–857). Discourse on Islamic psychology reached its zenith during Islam’s golden age and heavily influenced medieval concepts of health and medicine throughout Europe and all Muslim territories. Translations of these original works have greatly contributed to contemporary interest in Islamic psychology and the efforts to understand and apply these concepts.

Within Islamic psychology, there is a careful balance between Islam’s deterministic view of human life and discussions of free will. Islam emphasizes the role of God as all-powerful, and one of the pillars of faith (*Iman*) is belief in *qadar*, which is frequently translated from Arabic as predestination. Chittick and Murata (1994) translate *qadar* as “measuring out” and refer to God’s measuring out of good and evil to humans as a test of faith. The way that a person responds to this “measuring out” is free will. This careful relationship between predestination and free will in Islam

contributes to theories of personality, motivation, and personal development that run throughout discourses in Islamic thought. Given the need to balance these two views, the focus within Islamic psychology, as within other branches of Islamic sciences and philosophy, is on actual human behavior, with a careful outlining of desirable and undesirable behavior. Engaging in desirable behavior, that has been articulated within the Quran and prophetic tradition (*sunnah* and *hadith*), leads to a healthy personality and the absence of spiritual and psychological illness. Engagement in undesirable behaviors will result in undesirable personality characteristics. Examples of undesirable behaviors noted in the Quran include excessive eating, sexual promiscuity, and alcohol consumption. The influence of the Quran in Muslim understandings of the role of the human soul, mind, and body has and continues to serve as the basis for Muslim interpretations of human behavior. Traditional Islamic psychology is therefore inseparable from theological and spiritual perspectives on the roles, responsibilities, and potentials of all human beings. Islamic psychology can be used to understand the worldview of practicing Muslims as well as the ways in which human behavior has been viewed through a religious and spiritual lens over centuries. Islamic psychology is a classic example of the influence of religious ideas in understanding, explaining, and predicting human behavior.

William James and the James Family

William James was born on January 11, 1842, in New York City and died on August 26, 1910, in Chocorua, New Hampshire. He was a bridge figure between the intellectual and social milieu of the mid-nineteenth-century America of Ralph Waldo Emerson and Walt Whitman and the evolving international Modernist world of Sigmund Freud, Henri Bergson, and Alfred North Whitehead. He was part of one of America's most remarkable families who in the generations before his birth built resources of great wealth through business and entrepreneurial success. His father, Henry Senior, was an itinerant philosopher and theologian who authored dense and idiosyncratic texts related to the work of Swedish religious figure Emanuel Swedenborg. William was the eldest of five children born to Henry Senior and his mother, Mary Robertson Walsh. His eldest brother, Henry, born in 1843, became one of America's greatest novelists and men of letters. He had two younger brothers, Garth Wilkinson (Wilky) and Roberson (Bob), along with the youngest of the five, his sister Alice, born in 1848. It was Alice who came closest to the literary

and analytical gifts of William and Henry as evidenced in her letters and diaries. She also shared with them physical and mental collapses which in turn mirrored the experience of Henry Senior with what he called in a nineteenth-century term his "vastation" which denotes something closely akin to a depressive breakdown.

James' family traveled widely and frequently during William's younger years due to Henry Senior's search for an ideal place to educate his children and to satisfy his own restlessness. William was thus raised and educated in both the United States and Europe. He never completed an undergraduate degree, but he did manage to receive an M.D. from the Harvard Medical School in 1869 though he never practiced medicine. His medical and previous scientific training opened him to the world of physiology and experimental science. He taught anatomy and physiology at Harvard and went on in 1880 to pursue another career interest in the teaching of philosophy. A key point in this formative period came in 1872 where for 9 months he met in Cambridge, Massachusetts, with Charles Sanders Peirce, Oliver Wendell Holmes, and Chauncey Wright in what came to be called the Metaphysical Club. These meetings proved to be a prime source of inspiration and reflection that grew over time into what later came to be known as philosophical pragmatism. Pragmatism (a term James himself coined) became a school of thought that dominated American intellectual life up through the first third of the twentieth century.

James' Contribution

In 1876 James married Alice Howe Gibbens and proceeded with having a family of his own to go along with a wide-ranging career that spanned the next three decades. In 1877 he met the philosopher Josiah Royce who was to become one of James's great companions as well as a friendly intellectual rival and whose idealist framework differed dramatically from his own empiricism. James also discovered and incorporated insights from the work of the French philosopher Charles Renouvier that emphasized the role of freedom in human choice and action. During this most productive phase of life, James published a set of true classics. Among them are *Principles of Psychology* (1890), *The Will to Believe* (1896), *Pragmatism* (1907), and in 1902 the Gifford Lectures at Edinburgh that became *The Varieties of Religious Experience*. His written works including a voluminous correspondence along with his teaching and public lecturing constitute a major contribution to an understanding of the working of the mind with its functions, its needs, and its potentials. His recorded legacy stands the test of time and remains accessible to the specialist and the nonspecialist alike.

Throughout his work James became and remained a radical empiricist. He upheld and never relinquished his belief in experience as a reliable guide in the search for truth. It is crucial to note in any discussion of James' study of psychology and the psychology of religion his reliance upon an experiential, empirical, and pragmatic approach. Pragmatism viewed means and ends as interdependent. And in pragmatism, knowledge is social, relational, and dependent on the "flow" (an important Jamesian word) of ideas, sensations, and interactions between the interior self and any larger worldly context. Indeed, it was James who originated the term "stream of consciousness." It would be hard to imagine the contemporary clinical world and the dialog between psychology and religion without James' contributions. There the emphases on narrative and process can be directly traced to James and those who follow his often invisible

influence. Indeed, pastoral counseling, clinical pastoral supervision, and pastoral care would be significantly diminished without his concepts of "time line," "pluralism," and "healthy mindedness" as conceptual tools and perspectives to enlighten the search for meaning within the therapeutic alliance.

The Varieties of Religious Experience

The Varieties of Religious Experience deserves an exploration for a number of reasons. First, it is a crucial source for analysis of religious experience for interdisciplinary work among psychology, religious studies, anthropology, philosophy, and clinical supervision. Second, it has had a significant impact among those involved in recovering from addiction, most notably William Wilson, one of the founders of Alcoholics Anonymous. Wilson names James and *The Varieties* as a critical source in his understanding the enlightenment and freedom that came to him when he began to lay aside his addictive burden. And third, a number of the terms used in *The Varieties* (e.g., "sick soul," "twice born," and "healthy minded") have not been clearly or consistently identified with him in spite of their having shaped cultural, therapeutic, and academic discourse.

It is the content of *The Varieties of Religious Experience* that fixes its place among the realm of the classics. He explores in these two sets of lectures such topics as "Mysticism," "Saintliness," "Conversion" (two lectures), and the relation of "Philosophy" to religion. James takes on a perspective that places primary emphasis on what happens, what a person goes through, and what *are* her feelings or responses in regard to events, persons, texts, and life crises. He focuses upon direct human experience and not on the perspectives of philosophical speculation or abstract theological dogmatics. Overall, James believes that his empirical and pluralistic approach makes the most common sense.

In *The Varieties* he sees one form of religious experience as that of "healthy mindedness." It emphasizes human capacities for happiness and

self-confidence. These qualities are evident for him in the persons of Walt Whitman and Ralph Waldo Emerson and in Protestant liberal theology in general. The experience of the “sick soul,” on the other hand, identifies an inclination to melancholy and to a view of human nature as deeply flawed and in need of assistance. Examples identified with the “sick soul” are John Bunyan and Jonathan Edwards who demonstrate a consistently troubled or “anhedonic” response to life. James also articulates how the “healthy minded” and the “sick soul” represent characters that are either “once born” (optimistic, confident, determined) or in need of becoming “twice born” in order to be renewed, reinvigorated, or restored to a transformed state of wholeness. It must be added that no simple summary can convey the depth and subtlety of James’ analyses and commentary.

Several justifiable criticisms have been leveled at *The Varieties of Religious Experience*. The book is marked by a “decontextualized” and “ahistorical” frame of reference. Historical figures make appearances without commentary regarding what constituted the historical or social circumstances which may have contributed to their encounters with religious experience. He shows less or little innate sympathy for the experience of the Roman Catholic figures mentioned in the book thus perhaps displaying an attitude common to the era of Protestant hegemony in America at the time the lectures were written. And reviewers, notably G. Stanley Hall, were critical of his abandonment of experimental, positivist science as a way of testing and verifying his hypotheses about the various categories of religious experience he explores. In short, James is accused of having abandoned the scientific method for something that appears to be a methodology based on more purely descriptive, biographical accounts laced with philosophical language. These are all fair criticisms that unfortunately fail to take into account the carefully nuanced and empirically derived portraits and concepts that make up the work. James’ writing is deceptively simple and yet richly allusive as well as being psychologically precise and astute.

James’ Legacy

So what category of religious experience best describes William James himself? Was he “healthy minded” or a “sick soul”? Biographical evidence seems to indicate that he was both though not at the same time. Weighed down with fear and anguish, he progressed through a period of deep doubt and search for an identity and purpose as a young man suffering what appears to be a mix of clinical depression and panic disorder. James may thus at one point at least be identified as a discernible “sick soul.” He became, as he went forward, filled more with confidence and satisfaction with life that was communicated to others including his family, students, and professional colleagues. He transcended and moved beyond the anxiety, self-doubt, and inhibitions of the morbidly self-absorbed adolescent and young adult he had once been. James may thus be viewed as one who was among the “twice born” who incorporated and displayed a disposition marked by “healthy mindedness” as he matured. His curiosity and zest for exploration for all things was virtually never ending. He was, in the words of the great American psychiatrist Harry Stack Sullivan, committed to being among those “human beings to whom nothing is alien.” James died in 1910 at his beloved country home in Chocorua, New Hampshire, of complications related to a heart condition that had plagued him for many years. His legacy is rich and filled with meaning for all who would take the time to get to know this most American of philosophers.

James, Brentano, and Husserl

William James is widely known as the father of American psychology and a leading American philosopher. Religious studies scholars also know him as a founding father of their field. Surprisingly, however, James's vital contributions to the development of phenomenology, in general, and the phenomenology of religious experience, in particular, are virtually unknown or overlooked. Nevertheless, historically, James influenced phenomenologists Franz Brentano and Carl Stumpf and, in turn, Edmund Husserl himself.

Edmund Husserl was a German phenomenologist who worked in the early twentieth century. He is typically credited with founding the contemporary phenomenological tradition. Scholarship on the topic has shown that Husserl's development of the phenomenological method was inspired by his teacher, Franz Brentano, as well the work of William James. Although the term "phenomenology" had already appeared in

German philosophy in the works of Johann Heinrich Lambert and Immanuel Kant, it did not find widespread notoriety as a method until it was spread rapidly by Brentano's students. In Brentano's school of thought, phenomenology was conceived of as descriptive psychology. One of the earliest known uses of the word in that sense appears in a version of Brentano's notes for a course he offered in 1888. The course notes bear the title "Descriptive Phenomenology," although he later changed the title to "Descriptive Psychology" (Rollinger 2009).

Edmund Husserl studied under Brentano from 1884 until 1886 and liberally acknowledged his influence, praising Brentano as his "one and only teacher in philosophy" (Spiegelberg 1971). Through Brentano's connections, Husserl also studied under Carl Stumpf at the University of Halle at Wittenberg, Germany, beginning in 1886. Stumpf had met William James in Prague and the two men nurtured a lifelong friendship. After years of correspondence with James, Stumpf suggested to Husserl that he should read James's work, *The Principles of Psychology*. Husserl read *The Principles* extensively and came to greatly admire James's work. In the opening sentences of his 1904/05 lecture series, Husserl writes that James was a figure "whom I still study and from whom I have experienced strong momentum" (Husserl 2007). Recent scholarship shows how the connection between James and Husserl helps illuminate the phenomenological structures in James's work (Meierdiercks and Snarey 2016).

James's Phenomenological Approach

William James scholar James Edie acknowledged that the intrinsic and logically necessary convergences between James's work and the work of the phenomenologists show that they "make contributions to what is, in essential respects, the same program; that they hold fundamental doctrines in common; and that these doctrines are thus intrinsically and necessarily fated to the same philosophical triumph or failure" (Edie 1987). Edie believed that James strongly influenced the

development of these fundamental doctrines that were to become essential to phenomenology. Meierdiercks and Snarey (2016) supported these findings and showed that James presented distinct methodological similarities with early phenomenology in that he sought to return to experience and investigate states of consciousness and how their objects in a manner that is true to how they appear.

The following sections detail a few ideas central to the phenomenological approach, and their appearance can be traced to James's phenomenological investigation of religious experience described in *The Varieties of Religious Experience*. *The Varieties* was groundbreaking in its approach to describing religious experience through a psychological, as well as phenomenological, lens. In *The Varieties*, James carries out the psychological and phenomenological method that he began in *The Principles*. This approach is called the "phenomenological psychology of religion" by scholars such as Franklin Davis Duncan (1974) and Meierdiercks and Snarey (2016).

Experience and Intentionality

For James, experience is a dynamic "stream of concepts, images, intuitions, feelings and intimations, much of which may only tantalize our awareness at the fringe, but which colors and tints the whole of our experience in pervasive and profound ways" (Blum 2015). This conception of a "stream of concepts" includes an argument for the intentionality of experience. Following James and Brentano, Husserl characterizes experience as intentional as well, emphasizing the necessity for any act of consciousness to be a consciousness *of* something. Religious experiences often involve a vague, ineffable dimension of experience, and thus its inclusion is significant in broadening the understanding of what one can investigate phenomenologically. James did not shy away from those experiences in his formulation of intentionality.

When James began to collect personal testimonies and various source materials for the formation of his lectures, he intended to describe religious experience in a methodological manner while staying true to the richness of those

experiences so that we might understand what makes religious experience identifiable as such. In his lecture "Circumscription of the Topic," James writes, "The essence of religious experiences, the thing by which we finally must judge them, must be that element or quality in them which we can meet nowhere else" (James 1902/2002). For *The Varieties*, James considered as data the numerous personal accounts of religious experience. Edie notes that "William James's greatest single contribution to the study of religious experience was to show us how it could be found, delineated, and defined in a manner which would remain faithful to the uniqueness, the primordially and the intrinsic complexity of the experience itself" (Edie 1987). Part of this faithfulness to experience is James's analysis of several experiences which may not have otherwise been typified as religious. Throughout *The Varieties*, James considers as religious experience "the feelings, acts, and experiences of individual men in their solitude, so far as they apprehend themselves to stand in relation to whatever they may consider the Divine" (James 1902/2002).

The Natural Attitude and the Epoché

Consciousness of the transcendent and the question of God's existence were issues that occupied James's mind throughout his life (Bridgers and Snarey 2003). However, in *The Varieties*, James brackets the question of God's existence. This bracketing is an approach that would become typical of Husserl's phenomenology. Husserl critiqued the positivistic sciences for failing to reflect upon their epistemological and metaphysical presuppositions. The presuppositions that Husserl argues we must take into account include our beliefs that reality is independent of the mind and independent of experience. He argued that we must bracket these beliefs in order to examine our experiences as they are given to us in experience. Husserl identifies this act of bracketing as the phenomenological "epoché." This bracketing allows the investigator to reconsider the world in the phenomenological attitude. James's method features a similar move towards a presuppositionless focus on phenomena as they are given. As John Drabinski writes, "Both James and Husserl

express the following philosophical sentiment: The dualism at work in the modern period rests on abstractions, and these abstractions can be undercut if one properly examines one's lived-experience in its immediacy" (Drabinski 1993).

In *The Varieties*, James recognizes his responsibility to bracket presuppositions and embrace the phenomenological attitude. James's method shows that he is setting aside the natural attitude as well as his own beliefs and presuppositions to focus solely on the religious experience as described by the one who experienced it. James works to set apart the experience of the individual from questions about the factual nature of the theology behind the experience. To James, it is unimportant whether his reader believes in a god or even whether the individuals he is studying believed in a god. This perspective allows him to gather accounts of experience and analyze them without letting prejudices or pre-existing theological judgments interfere (Meierdiercks and Snarey 2016). James writes that from his "experiential point of view," one must identify even godless or quasi-godless creeds as religions according to the individual's understanding of what he or she considers divine. Thus, he does not investigate the origins of the phenomena or their possible purpose. James is interested in the experience of them: how they appear to us. This is the core of his phenomenological approach.

Essences

By examining intentional experience in this way, the phenomenologist works from examples of real, concrete, life-world experiences towards recognition of what constitutes them and how we recognize them as such. Husserl writes that phenomenology is ultimately concerned with being a "descriptive eidetic doctrine of transcendently pure mental processes as viewed in the phenomenological attitude" (Husserl 1983). Similarly, James's investigations begin with personal accounts of experience and then attempt to move towards the essential elements of those experiences. James's search for the essential qualities of religious experience culminates in the final

few chapters of *The Varieties*. James writes that "our normal waking consciousness, rational consciousness as we call it, is but one special type of consciousness, while all about it, parted from it by the flimsiest of screens, there lie potential forms of consciousness entirely different" (James 1902/2002). This flimsy screen parts when one is overtaken by a mystical experience. James describes the mystical experience as having four markers that justify our recognition of it as mystical. The first two marks, ineffability and noetic quality, are nearly always present in mystical experiences. The experience imparts a sense of gained knowledge upon the person experiencing it. James notes that this noetic quality carries with it a sense of authority for the person and a feeling of significance and importance that is difficult to detail. James writes, "No one can make clear to another who has never had a certain feeling, in what the quality or worth of it contains" (James 1902/2002).

The other two qualities that are nearly always present, but less distinctive than the first two, are transiency and passivity. The mystical state of consciousness comes upon the subject without their solicitation and cannot be solicited by repetition of circumstances. James notes that some practices may make one more conducive to bringing on a state of mystical experience, but that it cannot be controlled. The experiences are fleeting, rarely as long as half an hour, beyond which they "fade into the light of common day" (James 1902/2002). Their presence and quality can be remembered vaguely after time, and yet in their recurrence, there is an immediate recognition of their connectivity and continuous development upon the individual. James's chapters on mysticism, as well as being the clearest markers for his phenomenological method, show clearly what James suggested at the beginning of *The Varieties*: that a religious experience forms religions in the first place.

In sum, James paved the way for a phenomenological psychology of the magnitude that Husserl pursued. Further, religious experience is central to James's investigation of religion, and

his phenomenological approach continues to enrich contemporary religious studies.

James, William, and the Psychology of Religious Experience

Eunil David Cho¹ and John R. Snarey²

¹Graduate Division of Religion (GDR), Emory University, Atlanta, GA, USA

²School of Theology and Department of Psychology, Emory University, Atlanta, GA, USA

Introduction

Psychologist-philosopher William James (1842–1910) was a prolific author whose work is widely read by both psychologists and scholars of religion. To psychologists, his two-volume *The Principles of Psychology* (1890) is his major work, but to religious studies scholars, *The Varieties of Religious Experience: A Study in Human Nature* (1902) is most significant. Not surprisingly, religious studies scholars seldom study *The Principles* and psychologists seldom study *The Varieties*. This makes it difficult for both to see that James's psychological principles provide the foundation of his psychology of religion. Yet, the connections are invisible for another reason – the style and purpose of the two texts. *The Principles* is fundamentally James's encyclopedic textbook and, thus, conventional, academic, and explicitly pedagogical, whereas *The Varieties* is fundamentally James's artful masterpiece and, therefore, unconventional, popular, and implicitly enlightening. Even those scholars who have enjoyed both books may conclude that James “does not invoke in his discussion of religious experiences any of the psychological concepts he had labored through a decade earlier in his general psychological text” (Dittes 1973, p. 311). In this essay, we will document seven of the more prominent conceptual tools from *The Principles* utilized in and throughout *The Varieties* (cf. Snarey et al., 2019).

Concept 1: Neural Activity

James (1890/1950) devotes the first three chapters of *The Principles* to the topic of neurology, particularly the structure and function of the brain. In Chapter I, he defines psychology as “the Science of Mental Life” and discusses the importance of brain physiology in the psychological study of mental life (Vol. 1, p. 1). One of James’s aims in writing *The Principles* was to establish “The fact that the brain is the one immediate bodily condition of the mental operation” (Vol. 1, p. 4). The life of the mind, in brief, depends on cerebral conditions. In Chapter II, James describes how the brain hemispheres are divided into many different areas, each of which is closely associated with specific mental and behavioral functions. He stresses that sensory and motor elements are highly localized in the cerebral hemispheres because these two functions are “the elementary factors out of which the mind is built” (p. 30). Moreover, James describes neurons as “nerve circuits” and brain structures as localized way stations receiving input in the form of spatial-temporary patterns of nerve currents, which he likens to electric currents (Vol. 1, pp. 20–21, 656). James also introduced the term neural “plasticity” to describe the ability of the brain to change physically in response to experience (Vol. 1, pp. 104–108).

In Lecture I in *The Varieties*, “Religion and Neurology,” James (1902/1987) likewise proposes that religious experiences have a neural foundation. By drawing data from “*documents humains*,” the personal documents of highly religious individuals, James examines the “original experiences” of their religious encounters (James 1902/1987, pp. 13–15). He notes that these persons have often shown “symptoms of nervous instability” (p. 15). These neurotic and biological symptoms include “exalted emotional sensibility,” “discordant inner life,” “trances,” and “melancholy.” These characteristics are seen in James’s (1902) accounts of religious experiences of notable “religious geniuses,” such as George Fox (Lecture I), John Bunyan (Lecture XIII), and Stephen Bradley (Lecture IX). James also begins *The Varieties* with the topic of neurology to reject, at the outset, the claims of neurological reductionism and, more

generally, of “medical materialism” (p. 21). Medical materialists believed religious states of mind are explained entirely by one’s physical being. For James, religious experiences are not reducible to solely biology and that attributing religious experiences to physiological origins alone does not explain their spiritual value (Snarey and Bridgers 2006; Kime and Snarey 2018).

Concept 2: Habits

In Chapter IV of *The Principles*, “Habit,” James (1890) acknowledges that animal and human behaviors are, in part, governed by instinct but then notes that instinctive behavior is not always blind and invariable (Vol. 1, p. 104). Rather, such behavior is modifiable by experience, and animals and humans develop new consistent patterns of behavior across time. James identifies these learned patterns as habits, and explains that humans are subject to the law of habit because we have bodies. The plasticity of the living matter of our nervous system is the reason why an activity is difficult the first time, but after repetition, it develops into a habit. Repetition causes the same neural brain pathways to become entrenched, and therefore it becomes easier for energy to pass through them. On the societal level, habit functions at the great “flywheel of society” in that it stores energy and resists change by inertia (Vol. 1, p. 121). As James observes, “It keeps the fisherman and the deck-hand at sea through the winter; it holds the miner in his darkness, and nails the countryman to his . . . lonely farm through all the months of snow” (pp. 158–159). In this regard, James, ever even-handed, notes the constructive and destructive functions of habit. It is constructive, for instance, in conserving a person’s physical and mental energy but destructive when maintaining social institutions and the status quo at times when social change is needed.

In *The Varieties*, James (1902) frequently uses the habit concept. In Lecture I, he observes that the behavior patterns and conventional observances of members of religious institutions are “retained by habit” (p. 6). He elaborates that one’s religious identity is “communicated . . . by tradition, determined to

fixed forms by imitation, and retained by habit” (p. 15). By reducing the attention necessary to devote to our actions, habits allow persons to develop “our higher powers of mind,” particularly in maintaining “our moral and religious life” (James 1890/1950, Vol. 1, pp. 122, 315). In Lecture IX, James also refers to the vital role that habit change plays in conversion experiences. His case studies of missionary David Brainerd (pp. 212–214, 253), coal miner Billy Bray (pp. 249, 290–291), and army Colonel James Gardiner (pp. 220–223, 269) show that “to be converted” is a process by which a powerful religious encounter overwrites entrenched dull habits with religious ideas, previously peripheral in one’s consciousness, to take center place – “the religious aims form the habitual centre” of one’s energy (p. 196). Further, the new habituated epicenter allows the converted to help others to shake loose the “entrenched dull habits” that James believed underlie institutionalized religion (1902, p. 6).

Concept 3: The Subconscious Mind

When James wrote *The Principles*, the “subconscious” was an emerging concept. Thus, he discusses unconscious processes in several chapters. In Chapter VI, “The Mind-Stuff Theory,” James highlights the emerging character of this research by noting that some writers discuss “unconscious cerebration” and others, “unconscious thought” (p. 164) and discusses several unresolved questions. Despite his critiques, James fundamentally endorses the emerging concept (cf. Weinberger 2000). In Chapter VIII, “The Relations of Minds to Other Things,” James examines unconsciousness in sleep, fainting, and other unconscious conditions, including abnormal mental states (pp. 199ff). When discussing “unconsciousness in hysterics,” James cites the distinctions made by French psychologists Pierre Janet and Alfred Binet between “primary or normal” consciousness and “secondary consciousness” or “unconsciousness.” James notes that “*a secondary consciousness* [was] entirely cut off from the primary or normal one, but susceptible to being *tapped* and made to testify to its existence in various odd ways” (Vol. I, p. 203, italics in

original). From here on, James adopts a preference for “subconscious” rather than “unconscious” (Vol. I, pp. 202–213). James states, “The acts and movements performed by the subconscious self are withdrawn from the conscious one, and the subject will do all sorts of incongruous things of which he remains quite unaware” (Vol. I, p. 208; cf. p. 259).

In *The Varieties*, James’s conception of the subconscious came to full fruition, functioning as a bridge linking personal psychology and theology. For James, the discovery of the subliminal or subconscious is “the most important step forward that has occurred in psychology since I have been a student of that science” (1902, p. 233). He again cites the explorers of the subconscious: in addition to Janet and Binet, he gives prominence to Frederic W. H. Myers and also cites Breuer, Freud, Mason, and Prince (p. 234). In *The Varieties*, James prefers “subconscious,” following Janet and Binet, and “subliminal” following Myers (1902, p. 233; cf. pp. 207, 239, 382). As he did in *The Principles*, he notes that the terminology is not yet settled in the field. Thus, he says that “if the word ‘subliminal’ is offensive to any of you...call this latter the A-region of personality, if you care to, and call the other the B-region. . .” (1902, p. 483). James also describes the role of the subconscious in a variety of religious experiences, including *conversion experiences* – its suddenness due to subconsciously incubating processes and ripening ideas (pp. 207–215, 230–237); *saintliness* – subconscious influences involved in the development of a saintly life governed by spiritual excitement (pp. 269–270); and *mystical experiences* – the subliminal region functions as a doorway, allowing for openings in normal consciousness to mystical experiences or cosmic consciousness (pp. 379, 388–398, 524; cf. Bridgers 2005, pp. 133–178).

Concept 4: The Stream of Consciousness

James introduced the concept of “The Stream of Consciousness” in James 1884 as a metaphor for one’s awareness of one’s environment. Six years later he used the chapter title, “The Stream of Thought” in *The Principles*, and then 2 years

later he returned to “The Stream of Consciousness” in *Psychology: The Briefer Course*. He begins by stating that “The first fact for us, then, as psychologists, is that thinking of some sort goes on.” He then asks, “How does it go on?” (Vol. 1, pp. 224–225). To answer the question, James presents a robust exegesis of the five primary characteristics of consciousness (Vol. 1, pp. 225–290). First, consciousness is *personal* – every state of consciousness reflects the experiences of each unique individual. Second, the flow of each person’s stream of consciousness is marked by constant *change* – in part because the brain itself is constantly modified by each experience. Third, each person’s consciousness is *sensibly continuous* – consciousness after a time-gap, for instance, feels as if it is continuous with the consciousness before it. Fourth, consciousness is *functional* – it deals with objects independent of itself and possesses the function of knowing, it helps the individual adapt to the environment. Finally, James notes that consciousness is *selective* – among concurrent possibilities, consciousness compares and selects some objects to the exclusion of others (Vol. 1, p. 288). Overall, the stream of consciousness is the medium in which every feeling, act, and experience is immersed.

James’s conception of the stream of consciousness became a renowned concept that influenced not only psychology but also philosophy and literary studies. It also is vital in understanding how James studies religious experience psychologically, and why he examines individual religious experience, rather than institutionalized forms of religion. In Lecture II of *The Varieties*, “Circumscription of the Topic,” James (1902/2002) reveals that his goal is to study “the feelings, acts and experiences” of individuals in their solitude in relation to “whatever they may consider the divine” (p. 31, cf. 34, 39). He focuses on “interior” personal spiritual experience by analyzing the varieties of “firsthand” accounts of religious experiences. The concept also explains individuals’ propensity to find “unseen realities.” In Lecture III: “The Reality of the Unseen,” James argues, in human consciousness, there is “*a sense of reality, a feeling of objective presence, a*

perception of what we may call ‘something there,’” (p. 58). James calls this particular sense, “undifferentiated sense of reality,” and analyzes several accounts of religious individuals who have felt a powerful “consciousness of presence” (p. 59). Thus, the continuous, selective, and personal characteristics of consciousness greatly informed James’s psychological concepts throughout *The Varieties* as he explores what happens to an individual at the intimate moment of religious encounter.

Concept 5: The Self

In Chapter X of *The Principles*, James discusses the manifold nature of “the self” in its native complexity. James distinguishes between the terms *I* and *Me*. The *I* or “pure ego” is equated with “the self-as-knower” and is characterized by a sense of personal identity, that is, a sense of continuity through time (James 1890/1950, Vol. 1). The *I* provides the thread of continuity between our past, present, and future selves. The concept is functionally parallel to older notions of the “soul,” “spirit,” and “transcendental ego” (pp. 343ff). The *Me* or “the empirical ego,” on the other hand, is equated with “the self-as-known” and composed of the empirical elements considered to belong to oneself. For James, because a gradual transition takes place between *Me* and *mine*, he claims the empirical self is composed of all one can call one’s own (Vol. 1, pp. 292–297). Accordingly, James divides the *Me* or empirical self into three components: (a) the *material me* – including the physical body and all possessions intimately associated with it; (b) the *social me* – includes the “recognition” a person “gets from his mates;” “a man has as many social selves as there are individuals who recognize him;” and (c) the *spiritual me* – includes the “entire collection of my states of consciousness.”

In *The Varieties*, James’s psychological concept of the self, particularly its multifaceted nature, is clearly visible. By extracting keen insights from his own experience and autobiographical accounts of religious persons, James

explores how religious people often can be characterized as “once-born” or “twice-born” persons, as “healthy-minded” or “sick-souled” personalities, and as “a divided self” (he also discusses the process by which religious selves can be “unified”) (cf. Lectures IV to VIII). Specifically, James claims that religious persons with “the twice-born” characters frequently seem to portray “a certain discordancy or heterogeneity” in their sense of the self, often with “an incompletely unified moral and intellectual constitution” (James 1902/2002, p. 167). Furthermore, James’s concept of the three constituents of the *Me* self provides a basic framework for understanding one’s own religious experience. In *The Varieties*, James pays particular attention to how the spiritual self develops. The spiritual self is “the very core” of the self, that is, more concrete or permanent than are the other two selves. In Lecture IX, “Conversion,” James describes the conversion account of 23-year-old Stephen H. Bradley. Although James does not use the phrase “spiritual self” in analyzing Bradley’s conversion, James focuses on describing the formation and development of Bradley’s spiritual self, that is, how Bradley comes to understand and cultivate his moral and religious aspirations in relation to his view of a divine figure as he encounters “spiritual” and “mystical” experiences.

Concept 6: Emotion

In Chapter XXV of *The Principles*, “The Emotions,” James reversed the traditional belief that emotions result from the perception of an event (e.g., we see a bear, we become frightened, and then run). James proposed that bodily changes in reaction to a stimulus (reflex effects) precede the experience and identification of an emotion (we see a bear, we suddenly run, and then we are frightened). He theorizes “that the bodily changes follow directly the perception of the exciting fact, and that our feeling of the same changes as they occur IS the emotion” (Vol. 2, p. 499). To appreciate James’s revolutionary perspective, one must remember that the contemporary scientific

community widely believed that reaction to a stimulus was cognitive and that bodily changes that resulted were primarily reactions to a thought. Only a year after James’s first journal publication of his theory, Danish physiologist Carl Lange independently published a similar view. So James reports on Lange’s research in *The Principles*, and the idea that the main cause of emotion is physical came to be known as the “James-Lange Theory of Emotions.” Notably, the James-Lange theory only claimed to apply to the “coarser” emotions (e.g., fear, anger, joy, etc.), whereas the “subtler” emotions (e.g., moral, intellectual, aesthetic feelings) continue to be regarded as a secondary product of cognition since they did not require the same type of bodily response (Coleman and Snarey 2011).

In *The Varieties*, James (1902) notes that emotion is one of the primary psychological components of individual religious experiences. This concept is particularly evident in the discussion of conversion in Lecture IX. Several case studies demonstrate that a conversion experience can be triggered by the “explosive intensity” of “coarser” religious emotions, which forcibly precipitates mental rearrangement (pp. 162, 173, 198). Love, jealousy, fear, hope, happiness, and anger are salient examples of explosive emotional characteristics preceding conversion. James also explains that some individuals may not have conversion-like experiences because they lack religious emotional sensibility and cannot imagine “the invisible” (p. 204). Further, in Lecture IV and V, “The Religion of Healthy-Mindedness,” James classifies the “mind-cure” movement as a religious phenomenon. He explores how its proponents tended to be optimistic, and healthy-minded, and are able to “let go,” freeing themselves from negative emotions (p. 177). What intrigued James about these religious encounters is the way in which their emotional component appears to create the rudiments of a belief, so that “the will to hold that belief is already in place” (Myers 1985, p. 476). Of course, James does not explicitly label his commentary as an application of the James-Lange theory of emotion but, rather, uses the theory unobtrusively.

Concept 7: Will

In “Will,” Chapter XXVI of *The Principles*, James discusses volition and claims that ideas of actions often flow automatically into behaviors. “Voluntary movements must be secondary, not primary functions of our organism” (Vol. 2, p. 487). A person retains the ideas of possible actions from prior experiences, which accumulate into a stock of ideas of various action that are possible, and the memory of them is a prerequisite to voluntary behavior. James theorized that once an attended-to idea is well developed, the act will follow (habitually or reflexively) as a matter of course. In other words, the phrase “we think the act, and it is done” is the basis of James’s “*ideo-motor action theory*” of behavior. Of course, obstacles may prevent the willed act from becoming actual. James worked out that the vital component of “willing” is to maintain one’s attention on the idea of the intended act, against competing ideas. The function of attention is, therefore, critical. From the ideas of possible behaviors, a person selects one for attention, and that idea ultimately activates behavior because, as James states, “what holds attention determines action” (Vol. 2, p. 315).

In “The Reality of the Unseen,” Lecture II of *The Varieties*, James (1902) notes that what essentially characterizes the religious life is attending to the idea that “there is an unseen order, and that our supreme good lies in harmoniously adjusting ourselves hitherto” (p. 53). To be religious, one must have this kind of belief – what James also calls – “the religious attitude in the soul” (p. 53). Because ideas can cause behavior, religious ideas can have real effects. For example, those concerning the attributes of divine figures would result in religious behaviors, such as prayer, meditation, and conversion: “*The terminus of the psychological process in volition, the point to which the will is directly applied, is always an idea*” (Vol. 2, p. 567, italics in original). James continues exploring the role of volition in conversion in Lecture IX. By using the research of Edwin Starbuck, James identifies two types of conversion. First, the “volitional” individuals experience conversion in “a conscious and voluntary way” by gradually building up “of a new set of moral and spiritual habits”

(p. 206). Second, the “self-surrendered” ones, on the other hand, encounter conversion when their personal will is completely “given up” (p. 208). But, for James, the difference between the two types is not radical. Even in the most voluntary or willingly built-up conversion, there are passages of partial self-surrender.

Conclusion

The Principles was James’s first masterpiece. Its publication in 1890 brought James to prominence as a psychologist, and it shaped psychology as a separate academic discipline. Two years after its publication, in the epilogue to *Psychology: The Briefer Course*, James (1892) reflects critically on the future direction of psychology as a field of science. He notes that “psychology as a natural science” does not necessarily mean “a sort of psychology that stands at last on solid ground” (p. 334). James challenges the readers of psychology to consider how psychology is still in the “particularly fragile” state such that its “assumptions and data must be reconsidered in wider connections and translated into other terms” (pp. 334–335). He accepted his own challenge by putting psychology in wider conversation with religious studies. This effort culminated in James’s second masterpiece, *The Varieties*. In the intricate but unobtrusive connections between *The Principles* and *The Varieties*, we see the continuous evolution and development of James’s thinking as a psychologist-philosopher who had a keen interest in “interior” personal religious experience and believed in religion’s value and function in human lives. This groundbreaking interdisciplinary approach to study religion’s valuable functions to meet human needs is his scholarly legacy as well as a most valuable contribution to the psychology of religion.

Israel Institute of Jungian Psychology, Ra'anana, Israel

History

Jerusalem is a city holy to Judaism, Christianity, and Islam, in which it is the third holiest city after Mecca and Medina.

The history of Jerusalem dates back to the fourth millennium BCE. According to the Biblical narrative, it was a small, fortified Jebusite city until made capital by King David in the tenth century BCE. He brought the Ark of the Covenant, holding the stone tablets with the Ten Commandments, to Jerusalem, later placed in the Holy of the Holiest in the temple built by his son, King Solomon. The Babylonian King Nebuchadnezzar destroyed Jerusalem and deported much of the population in 586 BCE. However, decades later King Cyrus allowed the Jews to return, and the Second Temple was completed in 516 BCE, later rebuilt and enlarged by Herod in the first century BCE. Hellenism was introduced by Alexander the Great, who ruled from 332 BCE. While the Jews eventually regained the rule, the Romans took control in 63 BCE. Jesus, born c. 6/5 BCE, towards the end of Herod's reign, was crucified at Golgotha, probably in 30 CE.

The Second Temple was destroyed, presumably on the day of the destruction of the First Temple, ninth of the month Av, in 70 CE. In 131, Emperor Hadrian renamed the destroyed city Aelia Capitolina and built a temple to Jupiter, prohibiting the Jews from entering the city. With the Muslim conquest in the seventh century CE, Jews were allowed to return. In 715, the Umayyads built the al-Aqsa Mosque at the Temple Mount.

The Crusaders ruled from 1099, barring non-Christians from the city, which was captured by Saladin in 1187. In the early sixteenth century, Jerusalem and the Holy Land were conquered by the Ottoman Empire. Jerusalem remained

desolate for centuries, with a population of less than 9,000 in 1800. Only in the mid-1900s did the city recover and grow again. In 1948, Jerusalem was divided between Israel and Jordan, reunited in 1967 when Israel gained disputed control over Eastern Jerusalem, as well as of the Old City.

The Name of Jerusalem

Legend says Jerusalem has seventy names and is mentioned in the Bible by names such as City of Joy, of Confusion, of Praise, of Justice, of Righteousness, and of Bloodshed (e.g., Isaiah 1:22, 26; Jeremiah 49:25; Ezekiel 22:2). *The Holy* (Heb. I'r haKodesh) is today the name commonly used in Arabic (Al-Quds). The meaning of the name Jerusalem has been variously interpreted, e.g., as I'r Shalem, the city of peace and wholeness; as combining the Hebrew words Jerusha and Shalem, meaning *Legacy of Peace*; and as a combination of the name that Abraham gave the place after the near sacrifice of Isaac, (Adonai) Yireh, *the Lord sees* (Genesis 22: 1–14), with Shalem. The Septuagint and the Vulgate transliterate the name as Hierusalem, thus combining *Hieros*, the holy, with Shalem.

The plenitude of names, such as “Gateway to Heaven” (Genesis 28:17), reflects the extent to which Jerusalem is pregnant with archetypal imagery and projection of wholeness, often in tense contrast to the conflicts it has suffered through history. The Jerusalem Syndrome is a manifestation of the archetypal possession from which some visitors to the city suffer, as they tread ground numinously soaked in myth and religion.

Jerusalem takes its origin in the City of Shalem and bears its name from its mythological founder Shalem, the Canaanite god of creation, completeness, and the setting sun. However, while peace and wholeness have become the insignia of Heavenly Jerusalem, the darker shadow side of Jerusalem is present already in its archetypal origin, the twin brother of Shalem being Shahar, the Morning Star. Shahar (as in *Shacharit*, the Jewish morning prayers), or in his Christian denomination Lucifer, announces the arrival of light and consciousness, the shadow that brings light, the light of

consciousness that attempts to overthrow the rule of the gods but falls from heaven.

Archetypal Image of Center and Wholeness

In Judeo-Christian tradition, Jerusalem is a central image of peace and wholeness, a symbol of unity, justice, and future redemption (cf. Psalm 122:1–9; Revelation 21). The ancient Jewish prayer, “Next year in Jerusalem,” entails a request for spiritual rather than physical redemption.

Likewise, in Revelation 21, John describes Heavenly Jerusalem; “I saw the holy city, new Jerusalem, coming down out of heaven from God, prepared as a bride adorned for her husband. . . ‘Behold, the dwelling place of God is with man’.” Jerusalem is then described as “having the glory of God, its radiance like a most rare jewel, like a jasper, clear as crystal . . . the city was pure gold, clear as glass.” Thus, Jerusalem is a prominent symbol of the Self as God image, as an image of the seat of divinity in the soul of man.

In reference to Jerusalem as “the center of the earth,” Jung considers her as a symbol of the Self (1959, *CW* 9i., par. 256). However, as the heavenly bride (Revelation 21:9) and as “the goal of our longing for redemption,” he emphasizes Jerusalem as an archetypal image of the mother (1956, *CW* 5, par. 318; 1959, *CW* 9i, par. 156; 1958, *CW* 11, par. 612).

Likewise, the Shekhinah, God’s feminine aspect, which means dwelling, implies God’s manifestation in the world. The Temple in Jerusalem represents the dwelling of the divine presence, and with its destruction, says the legend, the Shekhinah was forced into exile. This would indicate not only a split between the masculine and the feminine aspects of the God image, but also that the sense of wholeness and completion is absent from the material dimension of the world. In the individual psyche, this reflects a condition of split between ego and Self (cf. Edinger (1972); Neumann (1970)), an incapacitating separation from one’s soul and inner sources, as expressed in Psalm 137:4–5: “How shall we sing the Lord’s

song in a foreign land? If I forget thee, O Jerusalem, let my right hand forget her cunning.”

Judaism ascribes central events, such as the binding or sacrifice of Isaac (the akedah), to the Temple Mount at the center of Jerusalem. An ancient belief has it that Jerusalem is the navel of the universe, and here Adam, the first man, was supposed to have been born out of the dust, the earth, *adamah*. Successive religions have claimed (cf. Elon 1996, p. 11) that the creation of the world began at the Foundation Stone of the *Temple Mount*, where the Muslim *Dome of the Rock* now stands. Some Jewish legends tell about stones raining from the sky, and from the stone that God threw into the abyss, the world originated, with Jerusalem at its center. The Kabbalistic Book of Splendor, the *Zohar* says, “groups of angels and cherubim hover above the Foundation Stone, and . . . from there all the world is blessed” (Vilnay 1973, p. 15).

Transformation from Human to Divine

In Christianity, the pivotal event taking place in Jerusalem is prominently Jesus’ casting out the money changers and the pigeon sellers from the Temple, and the Passion story, with the crucifixion at its center. Jesus confronts the shadow which has taken its seat in the house of prayer and the corruption which has taken predominance over the spirit. The process of individuation often requires a betrayal of collective loyalties (Edinger 1987, p. 83). The ensuing passion story, with the Crucifixion, Burial, and Resurrection of Jesus, entails the grand transition of *Yeshua*, Jesus from Nazareth to *Christ*, the Anointed, and the Messiah. The human ego “is nailed to the mandala-cross representing the Self” (1987, p. 98). As a psychological process, the coniunctio of the crucifixion reflects the ego’s transformation into Self.

The Night Journey

Muhammad’s night journey on his flying horse *al-Buraq*, which had the face of a woman, the

body of a horse, and the tail of a peacock, is described in the 17th Sura (chapter) of the Quran as taking place from the Holy Mosque in Mecca to “the farthest mosque” (*al-Masjid al-Aqsa*). While *al-Aqsa* has been understood metaphorically, it is sometimes considered to be in recognition of Islam’s roots in Judaism that *al-Aqsa* received its earthly location and was built at the Temple Mount in Jerusalem. According to legend, Muhammad tied the horse to the Western Wall of the Temple Mount, from where he ascended to the seventh heaven, together with the angel Gabriel. On his way he met the guardians of heaven, the prophets of other religions, Adam, Jesus, St. John, Joseph, Moses, and Abraham, who accompany him on his way to Allah and accept him as their master. As Muhammad ascends to heaven, he leaves his footprint on the Stone, and as he returns, he brings the instruction for the daily prayers.

Muhammad’s ascension and return from heaven takes place on a ladder of the prophets that preceded him, thus serving as an axis between earth and heaven, between human and divine, similar to Jacob’s dream of the ladder, the foot of which was in Beth-El (house of God), while its top, according to Rabbinical folklore, reached the gates of heaven from Jerusalem.

Self and Shadow

While Jerusalem is a symbol of wholeness, it entails a plenitude of shadows, as hinted in its archetypal origin. The prophet Ezekiel describes the Godforsaken Jerusalem as poor and neglected, as a shameful and condemned whore (Ezekiel 16).

The shadow aspects of the psychological myths pertaining to Jerusalem are evident in actual locations in this city, so full of places where religious events with great psychological implications have taken place. The agony of Via Dolorosa and the tears at the Western Wall are prominent, and both reflect the close proximity of shadow with Self, of pain, agony, loss, and destruction with wholeness and ascent.

Legend has it that Judas Iscariot struck the deal to betray his Master in the country home of

Caiaphas, at *The Hill of Evil Counsel* (cf. Shalit 2008, p. 125 ff.). Likewise, near the Old City lies Gehenna, *The Valley of Hell*, which once was the site of a fire altar called Tophet, inferno. Children were burned here as sacrifice to the Ammonite king-god Molech, as mentioned in 2 Kings 23:10:

And he defiled the Tophet, which is in the valley of the son of Hinnom, that no man might make his son or his daughter to pass through the fire to Molech.

Eventually the shrine was abandoned and became a dumping ground for criminals and outcasts, whose corpses were burned in the constantly burning fire, creating the smells and fires of hell. It was before a crowd of priests and citizens in the Valley of Hell that the prophet Jeremiah denounced their pagan practices. He smashed an earthenware jar and cried out, “Thus says the Lord of hosts: So will I break this people and this city as one breaks a potter’s vessel, so it can never be mended” (Jerusalem 19:11).

Jerusalem prominently reflects three aspects of Self and Individuation symbolism: wholeness and unity of opposites, transformation from human to divine, or, psychologically, from ego to Self, and the ladder or axis between ego and Self.

However, as an image of wholeness, or Self in the terms of analytical psychology, it entails, as well, a powerful shadow of hell and evil, of conflict, loss, and mourning. Jerusalem reflects the interdependence between material and spiritual, human and divine, and between shadow and Self.

Jerusalem Syndrome

Mark Popovsky

Department of Pastoral Care, Weill Medical College of Cornell, New York Presbyterian Hospital – Chaplaincy, New York, NY, USA

The term Jerusalem Syndrome refers to a group of psychopathological phenomena in which religious delusions lead to or are triggered by a visit to the city of Jerusalem. Those suffering from Jerusalem Syndrome characteristically believe themselves to be biblical or messianic figures. Common patterns of behavior include splitting away from sightseeing groups or families and touring the city on one's own, a sudden increased interest in issues of cleanliness and ritual purity, shouting biblical verses or singing liturgical songs in public, formal processions to holy sites, and delivering sermons which may be strongly moralistic in nature or altogether incoherent. Violent

behavior is rare. However, in one well-publicized case, an Australian tourist set fire to the Al-Aqsa Mosque in 1969.

Written records of foreign tourists expressing symptoms of Jerusalem Syndrome date back to the mid-nineteenth century when rail travel first made visiting Jerusalem accessible to a large number of Europeans. The Jerusalem psychiatrist Haim Herman published his clinical observations in 1937 opining that the phenomenon made distinguishing between the normal and the pathological psyche twice as hard in Jerusalem as in any other city. Since that time, debate in the medical literature has primarily revolved around understanding if visiting Jerusalem itself may actually trigger a psychotic episode in some or if long-standing psychopathology causes the visitor to travel to Jerusalem in the first place.

Most authors agree that the majority of cases today involve individuals with prior histories of psychiatric illness who have set out to visit Jerusalem under the influence of a religious delusion. Nevertheless, one expert describes a discrete form of Jerusalem Syndrome in which no previous mental illness exists and the psychotic symptoms spontaneously resolve to full recovery shortly after removing the person from the city. While those with previous psychiatric histories manifesting symptoms of Jerusalem Syndrome are roughly estimated to be 50% Christian and 50% Jewish, the overwhelming majority of those exhibiting the discrete form of the illness with no prior psychopathology are Protestant Christians. The overall rate of foreign tourists hospitalized for psychiatric reasons in Jerusalem does not differ from that of comparably sized cities. Though less well documented, similar psychiatric phenomena have been reported in other holy cities including Florence (Stendhal Syndrome) and Mecca.

Jesuits

Paul Giblin
Loyola University, Chicago, IL, USA

Saint Ignatius

In 1534 Ignatius of Loyola gathered a small group of university graduates in Paris and gave them the Spiritual Exercises. The Exercises came out of Ignatius' ongoing conversion experiences especially while recuperating from a cannonball wound and on pilgrimage in Montserrat and Manresa, Spain. The Exercises call the retreatant to focus interiorly and accept God's action in one's life; they also help one to focus one's life direction. Ignatius and his "companions in Christ" made vows of chastity and poverty and were filled with a missionary desire to imitate the life of Christ, to preach the Gospels, and to serve the poor. In 1540 the Society of Jesus, the Jesuits, was formally approved by Pope Paul III, and Ignatius was elected its first general.

The Jesuit charism is that of "contemplation in action," grounded in disciplined prayer practice and service to those in need. Jesuits are called to "find God in all things," to live generously, and to serve "for the greater glory of God." This spirituality is not a monastic withdrawal from the world. Quite the contrary, its defining vision is to find God through engagement with the world. Jesuit service has taken many forms, beginning with missionary activity, a large educational focus, and an ongoing social justice commitment.

The foundational documents of the Society of Jesus are threefold: the Spiritual Exercises, the Constitutions of the Society of Jesus, and St. Ignatius' autobiography. Jesuits make the Spiritual Exercises in a 30-day retreat at the beginning of their ministry and upon taking final vows. They renew this experience annually in an 8-day retreat. Essential to ongoing Jesuit spiritual practice is the Examen, which is a twice-daily time of prayer and reflection on God's activity in their lives. Jesuits learn the practice of "discernment of spirits." This involves listening to the movements of one's heart; it is based on the assumption/experience that God speaks through the people and events of one's life, and one tunes into God's presence by listening to the movements of one's heart. The Jesuits are the largest male religious order in the world. What follows is a sampling of five Jesuits, admittedly an arbitrary choice of the author's "favorites," who embody the essence of Jesuit spirituality. This entry concludes with a summary of the essential elements of Jesuit spirituality.

Gerard Manley Hopkins

Gerard Manley Hopkins is the "Jesuit's greatest poet." He is the only Catholic priest and Jesuit honored in the Poet's Corner of Westminster Abbey. He is known for intensity and originality of language, experiments with "sprung rhythm," and as a religious poet who thoroughly embraced the natural world. His poetry is meant to be heard rather than read.

Hopkins was born in Stratford, England, in 1844, the eldest of eight children, and encouraged for his artistic abilities. He, like his father, wrote poetry. He excelled in classical studies at Oxford. At 21 he converted from Anglicanism to Catholicism and at 23 entered the Jesuits, neither with the approval of his family. He was ordained a priest 10 years later and died at age 44. Hopkins was profoundly influenced by the Spiritual Exercises. Like Ignatius, he saw all creation as infused with the divine; he coined the term "inscape" to describe the "individual essence and uniqueness of every physical thing" and sought to understand the interconnectedness of all things. He saw God

as an "incomprehensible certainty" and lived a difficult life trusting in the mystery of God's providence. Hopkins struggled to balance the dual vocations of priest and poet. His academic-preaching load was heavy, his health was poor, and he struggled to give himself completely to God. He destroyed most of all his early poetry upon entering the Jesuits, seeing the dual vocations as incompatible. He created a small body of prose and poetry over a 14-year period beginning with creation of the "Wreck of the Deutschland," and this is only because of the encouragement of his religious superiors. Little of his work was published during his lifetime. Like Ignatius, Hopkins' life was one of service to God, with a significant cutoff from his family, and including an ongoing struggle with the "fascinating and terrible" dimensions of the spiritual journey. Hopkins was driven to describe the natural world, to reflect on its abundant uniqueness and the divinity reflected through it all.

Pierre Teilhard de Chardin

Pierre Teilhard de Chardin was the "most Jesuit of Jesuits in centuries" and a world class scientist and paleontologist. His vocation was to bridge science and faith, which he found as entirely complementary. God was to be found in all things, animate and inanimate, see *The Divine Milieu* (1960). He embraced Darwin's theory of evolution and wed it to spiritual/cosmic development; he believed that the universe continues to evolve, culminating in a convergence of all things in Christ. Evolution was spiritually directed, not a random process. That all humans have and are is gift from God is celebrated especially in his *Hymn of the Universe* (1965).

Chardin was born in south-central France in 1881. He was the fourth of 11 children raised in a strongly religious family. From an early age, he began collecting stones and minerals, had an "innate appetite for the earth," and a "certain love of the invisible." He entered the Jesuits at age 18 where his interest in science was encouraged by his superiors. He was ordained a priest at age 30. Shortly thereafter as a stretcher bearer

during World War I, he saw firsthand the evils of war. Ironically he would come to be criticized by religious authorities for being theologically too optimistic and dealing inadequately with sin.

His life experience as both priest and scientist spoke of a profound integration of faith and science, an intimate intermingling of divine, spiritual, and material. Like Ignatius he experienced several mystical moments. His theology however did not resonate well with the religious authorities, and he was “exiled” to China for 12 years and not allowed to publish anything theological or philosophical. *The Phenomenon of Man* (1959) and *Divine Milieu* (1960), like the rest of his writings, were published posthumously. Cardin died in 1955 at age 74 in New York. If the central Jesuit question is how to experience God in one’s life, Chardin answered, by uniting ourselves with the material, cosmic world, and with each other. An oft-quoted Chardin line captures this sense: “Someday, after mastering the winds, the waves, the tides and gravity, we shall harness for God the energies of love, and then, for a second time in the history of the world, man will have discovered fire.”

Karl Rahner

Karl Rahner was one of the most influential and prolific theologians of the twentieth century. He was an official papal theologian for Vatican Council II and was pivotal in shaping the Council’s thinking on church and revelation. He was a pastor and theologian who grappled with real-life issues, beginning with the search for God, questions of life meaning, religious inclusivity, women’s ordination, and the everyday dynamics of hope, forgiveness, gratitude, guilt, and failure. He loved history and sought pastoral answers in the teachings of the church. His theological starting point was human experience, most especially the radical questioning of human existence. Humans are fully themselves in consciously exploring their desires, their “infinite longing” but not finding satisfaction, and ultimately in union with God revealed in Christ. For Rahner, the Spiritual Exercises were “the existential root

out of which he did all his thinking.” His theology emerged from his mystical encounter with God, and his pastoral practice was to encourage such encounter for all persons.

Karl Rahner was born in Freiberg, Germany, in 1904. He was the fourth of seven children raised in a middle-class family. At age 18 he entered the Jesuits and was ordained at age 28. His older brother Hugo was also a Jesuit. After only 2 years in the Jesuit novitiate, he published his first article, “Why prayer is so indispensable,” and in so doing launched his life focus on spiritual practice. Rahner lived for 62 years as a Jesuit and died at the age of 80 in 1984.

John Courtney Murray

John Courtney Murray, like Rahner, was an architect of many of the Second Vatican Council’s most significant ideas. His was a vocation of bridging religion and public life. He held multiple public and civic positions and engaged diverse issues including academic freedom, religious education in public schools, tax aid to public schools, Selective Service classification, and US-Soviet relations. He advocated for religious freedom and argued for substantive church and civic debate on moral issues, trusting in Americans’ abilities to deepen their religious commitments. “For him, contemporary society (church and state) was healthy and moral in direct proportion to the types of questions that it collectively pursued. The broader the types of inquiry, the healthier the society” (Hooper 1993, p. 2). He argued for ecumenical and interfaith dialogue and dialogue with atheists. He struggled with the Catholic Church’s “over-developed sense of protectiveness and authority.” In 1954 his writing on religious freedom drew the censure of the Vatican; only 9 years later he was invited into a substantive role in the Vatican Council. His most famous book was *We Hold These Truths: Catholic Reflections on the American Proposition* (1960).

Murray was born in 1904 in New York, entered the Jesuits at age 17, and was ordained a priest in 1933. He was a Jesuit for 47 years and died at the age of 63 in 1967. Early Jesuit missionaries like

Francis Xavier and Matteo Ricci found that the Christian faith needed to respect, learn from, and approach other faith traditions with humility. John Courtney Murray heard God's voice in the dialogue between faith traditions, between church and state institutions, within church structures, and between the pulls of history and the future. His legacy was to embrace and not fear diverse voices.

William Meissner

W.W. Meissner is a psychiatrist, psychoanalyst, and Jesuit priest practicing in Boston, Massachusetts. He brings together religious training in theology and philosophy with medical and analytic training. John Courtney Murray was his mentor. Meissner's professional life task has been to build bridges between psychology and theology and between psychoanalysis and faith. He shows the interdependence of psychological and spiritual identity, how "grace builds on nature" while "respecting the ego's decision-making functions," and how psychosocial development has psychospiritual equivalents. He challenges Freud's view of religion as pathological and argues for the reality base and healthy dimension of religious illusion. Meissner has developed an impressive body of work including *Psychoanalysis and Religious Experience* (1984), *Life and Faith* (1987), *Foundations for a Psychology of Grace* (1966), three texts exploring Ignatius and Ignatian Spirituality, and most recently *Time, Self, and Psychoanalysis* (2007). Like Ignatius, Meissner seeks to "find God in all things," most specifically in the interplay between psychology/psychoanalysis and faith/religion.

Conclusion

Other Jesuit "giants" might have been chosen in place of the above five. Bernard Lonergan is a Canadian theologian with significant work in the area of theological method. Robert Drinnan was Dean of Boston Law School until he became a Congressman from Massachusetts. William Barry

is a psychologist, author, and spiritual director with significant contributions in the area of prayer and spiritual direction. The list goes on.

The abovementioned five Jesuits embody the charism of "contemplative in action." They are grounded in the experience and vision of the Spiritual Exercises. They have experienced the grace of God's self-giving often in profound mystical ways. Their response to God's self-gift is gratitude and service. Each in their own way has sought to "save souls." Jesuit spirituality is respectful of culture and individual freedom, while keenly aware of human limitation, constraining attachments, and social sinfulness. Jesuit spirituality is optimistic and hopeful, believing faith needs to engage fully with culture and reality. It is necessarily adaptive. It is particularly attentive to the dynamics of human desire, believing that God and human fulfillment are to be found in the depths of the heart's desires.

Jesus

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

There is no conclusive evidence to disprove the existence of the Jesus of history, although what evidence that does exist regarding his earthly life and ministry is minimal. Scholars date his birth at ca. 4 BCE. According to the Gospels, his home where he grew up was in Nazareth, possibly in lower Galilee (Matt. 2.23; Mark 1.9; Luke 1.26; John 1.45f). Most likely Jesus had siblings and was raised in a Jewish home and in Jewish traditions including attending synagogue and temple worship and becoming versed in the Jewish Scriptures. He probably helped his father as a builder in a nearby city. His public life begins at about age 30 and is marked in the NT Gospels by his baptism by John the Baptist in the River Jordan (Mark 1.9–11; Matt. 3.13–17; Luke 3.21–22; John 1.29–34). John the Baptist is thought to have been a member of the Essenes, a Jewish priestly millennia list sect invested in ascetic, apocalyptic beliefs, and practices. The Gospels portray Jesus in a stronger yet respectful light in relation to John the Baptist, suggesting a regard for the Essenes, connecting Jesus himself within the apocalyptic tradition of the Essenes, as well as the Maccabees and the *Book of Daniel*. In this way he is

presented as one who carries further and brings to fruition the apocalyptic expectations of past generations. He is presented as an itinerant preacher traveling from village to village addressing the uneducated and poor of an agrarian culture prevalent during this time. Scholars liken him to the cynic philosophers who are speaking out against the social norms of its society. He speaks of the “Kingdom of God,” an envisioned new world order of social justice and divine sovereignty. There are various meanings of this worldview presented by the Gospel writers, although the notion of a definitive and timely advent of the Kingdom is common to all of them. Jesus expected this religiopolitical shift to happen in his lifetime (e.g., Mark 8.38; Matt. 10.23, 16.27–28; Luke 9.23–27), as did Paul his (unknown) contemporary (1 Thes. 4.13–18; 1 Cor. 15). Being outspoken and visionary, Jesus attracts followers – including a selection of disciples. The Gospel of John presents Mary Magdalene as an intimate follower of Jesus, while making reference also to the “Beloved Disciple” whom Jesus loved (John 13.23–25). Jesus was arrested and executed as a martyr by Rome in ca. 33 CE. More than the historical figure, most of the early Christian literature including the New Testament presents some quality of the spiritualized Jesus. He appears as one who is transfigured (Mark 9.2–10) and resurrected (Mark 16.1–8) from the dead. Interestingly, his followers as portrayed in the Gospels appear not to expect an empty tomb nor a resurrection. In all four Gospels the women go to the tomb expecting to find his crucified body sealed within it. In the Gospel of John when Mary Magdalene sees that the tomb is empty, she demands that someone has taken Jesus’ body and put it somewhere else (John 20.13–15; cf. Mark 16.1; Luke 24.5). However, a variety of postmortal epiphany experiences of Jesus are presented. Jesus appears to Mary after his resurrection (John 20.11–18). He appears to the disciples who are gathered together in a closed room (John 20.19–23; cf. 24–29) and again appears to them on the shore of the Sea of Tiberias (John 21.1–14). He appears to Saul on his way to Damascus resulting in Saul’s conversion to Christianity (Acts 9.1–22). He also appears to Peter

(Acts 10.1–23) and to Stephen (Acts 7.54–60). The meaning of Jesus' resurrection has received much attention. For Origen of Alexandria (ca. 185–254), Jesus as the Christ occurs as the New Adam being in the pure and unbroken likeness of the divine prior to the Fall (*First Principles* I.2.8). Augustine says how Christ as *Adam secundus* restores the damaged *imago Dei* to its original state. This act of restoration extends even to the dead (*descensus ad inferos*). Freud likens Christ to Mithras who alone sacrifices (the bull) for the atonement of the guilt of the brothers (Freud 1913, p. 190). For Jung, Christ exemplifies the archetype of the self and represents a “totality of a divine or heavenly kind, a glorified man. . . unspotted by sin” (Jung 1969, p. 37). Paul speaks of being transformed in Christ by the “renewal of the mind” (*anakainōsei tou nous*) (Rom. 12.2; cf. 2 Cor. 4.16), relating a notion of spiritual rebirth which is fully penetrating. It is a reformulation process already begun and ongoing and will be brought to completion upon Christ's return (Rom. 8.18–25). Through Christ one experiences both suffering/dying and transformation into a spiritual body (*sōma pneumatikon*) (1 Cor. 15.44), a body which will have angelic substance and illumination like the stars (1. Cor. 15.41; cf. Dan. 12; Ezek. 1.28; Matt. 22.30).

Jesus Prayer, The

Georgios N. Maragkoudakis

Department of Theology, Faculty of Theology,
Aristotle University of Thessaloniki,
Thessaloniki, Greece

The Jesus prayer (or the prayer of the Heart and Mind) is a short prayer used mainly in the Eastern Christian Tradition for the purpose of achieving deification and, thus, salvation. This prayer involves the constant repetition of the divine name of Jesus Christ and its most common form consists of seven words: “Lord Jesus Christ, have mercy on me.” The basic idea is that by continuously repeating this small phrase one is able to achieve the stage of unceasing prayer, as suggested by Saint Paul in 1 Thessalonians 5:17. This process works miracles, according to the teachings of Hesychasm, which is a mystical tradition found within the realms of the Orthodox Church, because of invocation of the Holy Name of Jesus Christ that has the power to fight demons and to spiritually cleanse the practitioner (Mathewes-Green 2009). The practice Jesus Prayer is said to consist of five stages: Firstly it is said out loud. Secondly, after some period of time, the practitioner can repeat the prayer mentally. Thirdly, the Mind has completely absorbed the prayer and the prayer is repeated constantly by itself inside the Mind. Fourthly, through the Mind the energy of the prayer is absorbed by the Heart and repeated over and over inside the Heart in a mystical and difficult to express manner. At this stage, the Mind of the practitioner becomes purified and clean of both negative and positive thoughts. According to Hesychasm, this emptiness is full of the grace of God, because the person is now truly humble. Lastly, at the final stage, one can be in complete union with God and perceive the unutterable and apophatic cosmic reality (Johnson 2010).

The Jesus Prayer is usually recited with the help of a prayer rope. In novices, as the Orthodox Church Fathers teach, and under proper guidance, extra techniques can be used for enhancing

self-concentration. These include the slight bend of the head, so that the chin touches the left part of the chest, the sitting on a low stool, the closing of the eyes, the holding of breath, the linking of the in-breath to “Lord Jesus Christ” and of the out-breath to “have mercy on me,” the darkening of the room, etc. Under no way should the practitioner try to bring in mind any image, either God or of any person, thing, etc., any shape or any sound, because, according to the apophatic/negative theology behind the Jesus Prayer, the divine nature and reality is beyond words and names and completely without description (Ware 1989).

The practice of invoking the name of Jesus in a repeated prayer is very ancient and difficult to be exactly traced upon. Some say that it was Diadochos of Photike (fifth century) that for the first time introduced this new element in the already existing and much older tradition of unceasing prayer and contemplation. A rather common report is that of St John of the Ladder (seventh century) who stresses the importance of uniting the Jesus prayer with the respiration in order to achieve inner stillness. Another important name in the relative field is that of Symeon the New Theologian (tenth–eleventh century), who is – along with John the Evangelist and St Gregory of Nazianzus (fourth century) – one of the three great Fathers to whom the Eastern Orthodox Church granted the title “Theologian.” Also, Nicephorus the Hesychast, a monk at Mount Athos, which is a mountain and peninsula in northeastern Greece widely known as an important center of Eastern Orthodox monasticism, says that unspeakable joy and delight await the one that has his/her Mind united with the Heart.

It was with Gregory of Sinai (thirteenth–fourteenth century) that the Jesus Prayer was introduced to the Slavic Christendom and with Gregory Palamas (fourteenth century) that it was defended against the teachings of Barlaam of Calabria. Since then, one can find sermons and homilies that stress the importance of Jesus Prayer and its suitability for every christian, not only monks and nuns. This is clearly stated in the works of Nicodemus of the Holy Mountain

(eighteenth–nineteenth century), who, along with Makarios Notaras (eighteenth–nineteenth century) compiled the writings of 25 Fathers into a book named *Philokalia*, a greek compound word, meaning *love of beauty*. A very famous book about the Jesus prayer is called *The Way of the Pilgrim* and it was written in the nineteenth century by an anonymous Russian author (Dawood 2004). These teachings are expressed very vividly in the works and sayings of Elder Joseph the Hesychast (twentieth century) along with his disciples in Mount Athos (elder Ephraim of Philotheou (twentieth–twenty-first century), elder Ephraim of Vatopedi (eighteenth–nineteenth century), etc.

As we have seen, the Jesus prayer is a method that includes psychosomatic techniques. It is based on the idea that the physical and spiritual aspects of man are interconnected. Surveys can prove that daily practice can help both well-being and spiritual purposes, as well (Rubinart et al. 2016). Specifically, the following changes occur within one’s body immediately after practicing the Jesus Prayer: metabolic rate decreases, blood pressure lowers, heart rate lowers, oxygen consumption declines, muscles relax, brain waves configure into a serene Alpha state. If the prayer is made a habit, it is predicted, as supported, that one will: tolerate stress better, experience less dysphoria, increase longevity, booster immunity, experience more pleasure in living, mitigate or reverse brain deterioration, and feel closer to God (Zeiders 2013). Another survey suggests that the practice of Jesus prayer may affect a person’s well-being and relationships, including that person’s perceived relationship with God (Stavros 1998). Another survey suggested that the Jesus prayer can help cope conflicts, enhance mindfulness skills and a better connection with one’s subconscious (Rubinart et al. 2016).

4. G-d is eternal.
 5. Prayers are to be directed to G-d alone.
 6. The words of the prophets are true.
 7. Moses was true and the chief of the prophets.
 8. The whole Torah now in our possession is that which was given to Moses.
 9. The Torah will not be changed
 10. G-d knows all of the deeds and thoughts of man.
 11. G-d rewards those that keep his commandments and punish those that transgress them.
 12. The Messiah will come.
 13. G-d will resurrect the dead.

Jewish identity, however, is not predicated on one's set of beliefs and/or observances. A Jewish person does not necessarily practice Judaism, nor does one's strict observance of all the tenants of Judaism automate one's acceptance as a Jew. In accordance with halakha (Jewish religious law), one's Jewishness is either passed down matrilineally or through a conversion process to Judaism. However, some nonorthodox Jews support the transmission of Jewish identity through patrilineal descent. The matter of what constitutes a valid conversion to Judaism is an issue of contention across Jewish denominations, with the traditional movements denying the lawfulness of conversions taking place within the more liberal sects. There are further controversies with regard to whether one retains their Jewishness should they convert to another religion, or self-identify as atheist, as well as the matter of who should rightfully be considered Jewish by Israeli legislation, and so therefore have the right to settle and gain citizenship in Israel. For summaries of the most common denominations of Judaism, see entries on Orthodox Judaism, Conservative Judaism, Reform Judaism, and Reconstructive Judaism.

It is beyond the scope of this entry, which is concerned with the matters of Jewish care and counseling, to address in any depth positionings in the ongoing debates as to who is and is not rightfully considered a Jew, nor is it the intent to define the experience of Jewishness in a homogenous manner, but rather to acknowledge the concept of Jewish identity and culture as rooted in a particular social and historical context which

Jewish Care and Counseling

Nicole Gehl
The Priory Hospital, London, UK

The matter of Jewish identity is complex and multifaceted. Judaism is typically described as the religious system of the Jews, based on the belief in one G-d who created the Earth and gave the Torah in a revelation to Moses at Mt. Sinai. The Jewish philosopher Rabbi Moses ben Maimon or Maimonides (1135–1204) set forth the 13 principles of faith, compiled from the 613 mitzvot or commandments found within the Torah (the five books of Moses). These encapsulate the essential requirements of Jewish belief in his commentary to the Mishnah (Sanhedrin, 10):

1. Belief in the existence of the G-d the creator.
2. G-d is unity.
3. G-d is incorporeal.

despite the vast differences across Jewish individuals and communities have certain implications on the worldview of Jewish clients in treatment. The Jewish experience of psychotherapy and counseling has been historically ignored perhaps in part due to the fact that theirs is what is considered an invisible minority status (one cannot deduct Jewish identity by appearance alone, without the presence of external artifacts such as the presence of a star of David or a yarmulke) and in part because Jews often view themselves as having a bicultural identity, developed in part by their membership within a particular country and society (Schlosser et al. 2009).

In recent years there has been an upsurge of research and interest in ethnocultural factors in mental health care and the need for psychotherapists and counselors to be aware of Jewish culture, religion, and ethnicity and the impact that it has on the lives of their Jewish clients. This remains challenging as there is not any simple way of encapsulating the essence of the Jewish experience.

Jewish Issues

Schlosser (2006) asserts that there are basic issues and experiences that all Jewish people will have to negotiate. These include (a) anti-Semitism, (b) the Shoah (i.e., the Holocaust), (c) internalized anti-Semitism, and (d) the invisibility of Judaism. Anti-Semitism, defined as “a hostile attitude toward the Jews that has become institutional and traditional” (Halpern 1987, p. 3), has been prevalent across cultures in various forms for over 4,000 years and persists in contemporary society in blatant (Holocaust denial, Jewish conspiracy theories) and more subtle manners (exaggerations of the Jewish sphere of influence in government, finance, and the media). Anti-Semitic stereotypes impact religious and secular Jews alike, and for some Jewish people, learning about anti-Semitic events may be experienced as traumatic (Friedman et al. 2005). The Shoah (translated literally as “catastrophe” from Hebrew) is a term preferred by many Jews for what is more commonly known as the Holocaust,

the attempt at annihilation of the Jewish people by the Nazi regime, which resulted in the murder of over six million Jews. Research on the intergenerational transmission of trauma has led to the conclusion that all Jews feel the impact of this collective suffering and near extermination. One such result of this is the climate of fear experienced by Jews living in the Diaspora and the matter of “Jewish paranoia,” an issue raised by Kaye/Kantrowitz: “Many of us were taught that the world is dangerous because the world is dangerous. A therapist who treats this fear as a pathology seriously misses the point” (1991, p. 12). Another consequence is the matter of internalized anti-Semitism, which may manifest in feelings of self-hatred or shame regarding one’s Jewish identity, distancing oneself from the Jewish culture and heritage, and hostility towards practicing Jews. As mentioned above, people of Jewish identity are members of “a hidden diversity” (Naumburg 2007). Langman (1995) posits that they have had a minimal focus in multiculturalism for the following reasons: they are seen as an assimilated nonminority, economically privileged, part of the white majority, members of a religion rather than a culture, and due to the lack of awareness of Jewish oppression. The lack of attention to Jewish multicultural issues contributes to the Jewish people feeling alienated and marginalized by the mainstream.

Jewish Identity in the Consulting Room

It has been suggested that when a therapist and client share a background, empathy and rapport may be more readily established (Alladin 2002). However it is wrong to assume that a Jewish therapist is preferable for Jewish clients. In fact gentile clinicians may offer a unique space for Jewish clients who wish to explore their beliefs and practices, without feelings of guilt or shame related to appearing “a bad Jew,” or “not Jewish enough,” to a Jewish therapist (Naumburg 2007). The biases and beliefs that a Jewish therapist may have around their own identity may similarly provide a difficulty when understanding the experience of the Jewish client (Krieger 2010). Whether

or not there is a shared Jewish identity and regardless of how knowledgeable in Judaism one is, it is impossible for the therapist to know how the client experiences lived Judaism and must have a willingness to work with the question into the room. The culturally sensitive clinician should seek understanding of the Jewish client's level of religious observance and relationship with the Jewish community and with the dominant culture at large. Not every Jewish client will disclose their Jewish identity, however, and it is essential to follow the client's lead in this respect and with the utmost sensitivity in inquiring about a client's religious and ethnic background. The therapist must negotiate between demonstrating interest and respect for Judaism as an essential component of identity and respecting the wishes of the client whether or not to disclose this information (Schlosser 2006). Ultimately it is for the client to determine their Jewish identity's relevance to their difficulties which led them to seek help.

Jewish Families

Culturally competent mental health practitioners need an understanding of the central role of the family in Jewish culture and to foster an awareness of the possible value conflicts between its relatively collectivist culture and the biases of traditional therapies which place a strong emphasis on the individual. The importance of family in Judaism is emphasized in both the Torah and the Talmud (rabbinical teachings and commentary on Jewish law), and the subject of marriage and childbearing is regarded as the fulfillment of G-d's will. As is set forth in Genesis 1:27–28, "Be fruitful, and multiply, and replenish the earth." Within Orthodox communities, arranged marriages are commonplace. Inter-marriage (i.e., the marriage of a Jewish person to someone not Jewish) is forbidden by halakha. The consequence of choosing such a marriage is exclusion from the family of origin and the Jewish community. Instances of intermarriage have risen substantially in recent decades, and as a result the response of parents of children who have chosen intermarriage ranges from acceptance to sitting shiva

(carrying out rites of mourning), as though the child had died. Jewish families are typically child centered, and there are laws, which dictate the manner in which children and parents interact with one another; it is the duty of the parents to transmit Jewish values, history, and identity to the child and the duty of the child to honor and respect his parents. Conflicts around negotiating parental expectations and the emotional repercussions of being pulled towards their own desires are common emergent issues for Jewish clients in psychotherapy. The prospect of differentiation from the family of origin in asserting one's beliefs and lifestyle is a common struggle for adult Jews. For example, the requirement to honor and respect parents may prompt a sense of obligation for some clients to marry and have children before they are ready (Krieger 2010). The matter of defining boundaries and refining connections and obligations between family members across generations may be indicated in therapeutic work with Jewish families (Naumburg 2007).

Responsibilities of the Clinician in Counseling Jewish Clients

Clinicians working with Jewish clients have a duty to develop understanding of how anti-Semitism has manifested within their society historically as well as the manner in which it persists today. The first port of call is acknowledgement of its existence and to confront one's own beliefs and behaviors around Jewish culture and Jewish people. Sensitivity to one's own assumptions and prejudices is paramount prior to starting the therapeutic process with someone of a minority status, whether or not the clinician shares that aspect of identity. Counseling professionals should make an effort to have a basic understanding of Judaism, its history, and traditions as well as some awareness of the tenants of living a Jewish life. At the same time, the clinician needs to retain awareness that Judaism is more than a religion and that Jewish identity is widely variable and may be experienced differently between individuals within the same religious denomination and even within the same family of origin. For this

reason the clinician must be prepared to ask questions of the client's experience of cultural identity. Finally when counseling Jewish clients, clinicians would be well served to keep in mind that many taken-for-granted concepts such as enmeshment and paranoia are culturally bound and to maintain a flexible approach breaching such areas with caution and sensitivity. It is not just the client who sits with the therapist in the consulting room, but a host of familial and cultural experiences with distinctive support systems and variable communication styles.

Jewish Law

Mark Popovsky

Department of Pastoral Care, Weill Medical College of Cornell, New York Presbyterian Hospital – Chaplaincy, New York, NY, USA

General

Known in Hebrew as “Halakhah” (lit. “going” or “walking”), Jewish law represents a broad legal tradition regulating the full range of human activity including criminal matters, torts, worship, sexuality, marriage, divorce, diet, Sabbath observance, business ethics, and communal structure. Since the Middle Ages, a number of legal codes have purported to detail it in its entirety; however, no single book or set of books contains the full corpus of Jewish law. Rather, Jewish law is primarily a common law system with individual rabbis serving as judges who apply past precedents to novel situations. As rabbis may differ significantly in their interpretations of authoritative texts, individual practice under the aegis of Jewish law can vary widely from community to community.

Biblical Law

The roots of Jewish law begin in the legal sections of the Pentateuch, Exodus 19–24, Leviticus 1–26, and Deuteronomy 4–26. These biblical law codes combine apodictic and casuistic laws, suggesting a rich legal tradition in the biblical period containing both a centralized ruling authority and an organic process for law to develop as

experience accumulated. Even in its own time however, the laws of the Pentateuch were not sufficient by themselves to govern a society. Entire fields, such as family law, are virtually ignored, and individual dictates are often too vague to be applied in practice; for example, there are several commands to observe the Sabbath but almost no explicit direction regarding how to do so. Consequently, judges and communal leaders began adapting, expanding, and interpreting biblical law from its inception. No written record of this legal discourse from the early postbiblical period exists today, but a vast oral tradition of legal exegesis was transmitted from generation to generation of communal leaders. These legal decisors – called “rabbis” from the first century onward – were viewed as spiritual descendants of the biblical prophets such that their interpretations and legal rulings held that status of biblical law even when they clearly limited or contradicted an explicit biblical command.

Rabbinic Tradition

This oral tradition was first written in collections of Legal Midrash (*Midrash Halakhah*) somewhere between the second and fifth centuries. The books of Legal Midrash follow the order of the Pentateuch and purport to interpret each verse with legal ramifications. Some of the exegesis seems faithful to the original intent of the text, and other interpretations represent a clear effort to tie the current practices of the time to biblical verses even when no obvious link exists. This process of Legal Midrash allowed devotees to believe that their spiritual practice was rooted in the Bible even when the biblical text itself was too foreign or too vague to be of practical use without significant adaptation.

In second-century Palestine, Rabbi Judah the Prince compiled a vast legal text called the Mishnah (“Teaching”). It is arranged topically instead of according to the order of the Pentateuch. Unlike later law codes, it rarely presents definitive rulings on controversial issues; rather it summarizes generations of debates among scholars and records dissenting opinions. Often the positions described

are not accompanied by the legal reasoning supporting them, but occasionally the rationale or exegetical basis underlying each side of the debate is presented. The Mishnah was quickly canonized and rapidly disseminated among Jews. Its popularity elicited extensive interpretation and expansion. Scholars speculated about how each rabbi arrived at his particular ruling, brought borderline cases to further define each position, and added glosses to cover new situations. This body of interpretation on the Mishnah came to be called Gemara (“Learning”) and was eventually transmitted together with the Mishnah in a combined form that today we call the Talmud.

The Talmud grew to an incredible size before it was sealed in the fifth century. It weaves its legal discourse together with narrative, hagiography, theology, folk wisdom, and biblical exegesis of a nonlegal nature. It became the focus of Jewish scholarship for centuries and the basis for all future legal rulings. Like the Mishnah before it however, the Talmud often does not offer a definitive ruling on an open question but rather explores the rationales behind each viable opinion. Consequently, rabbis in the post-Talmudic period faced with the need to make a specific legal determination often corresponded by letter with more senior rabbis requesting advice on how to apply a particular Talmudic passage to a practical situation. These letters are known as Teshuvot (“Responsa”) and came to set authoritative legal precedents. Later Teshuvot cite earlier Teshuvot at least as much as they cite Talmudic discussions.

Medieval Period

In the Middle Ages, several leading rabbis attempted to write legal codes summarizing all the Teshuvot and other opinions on a given topic to date, allowing the reader to quickly find a definitive ruling. Many of these codes were criticized for omitting dissenting opinions and oversimplifying what had become a richly textured system of legal discourse. Nevertheless, these codes quickly found popularity among rabbis and knowledgeable Jews daunted by the breadth of texts on even the most simple topic. The most

famous of these codes (the *Mishneh Torah* compiled by Moses Maimonides between 1170 and 1180 and the *Shulchan Arukh* compiled by Joseph Caro in the 1540s) are still studied and cited today by rabbis as authoritative rulings on a wide range of subjects. Despite the popularity of these comprehensive codes, their rulings were general and required additional nuance prior to application in specific situations. Consequently, the responsa literature expanded throughout the premodern and modern periods and remains today the primary source for specific legal rulings.

Though ritual questions were usually addressed by an individual local rabbi, criminal, family, and civil matters were generally considered before a rabbinic court, called a Beit Din, consisting of three or more rabbis. From the Roman period onward, few Jewish communities were afforded sufficient autonomy by the ruling authority to hear criminal cases. Jewish courts themselves ceded the authority to rule on capital cases. Nevertheless, throughout history, civil matters were commonly decided according to Jewish law by rabbinic courts well into the modern period and remain so in some Jewish communities today. These courts have a range of non-corporeal enforcement mechanisms, most notably the threat of excommunication – a very serious punishment in the premodern period when the excommunicated Jew would have been unable to integrate into the surrounding non-Jewish society. It is a principle of Jewish law that, with rare exception, the secular laws of the ruling authority supersede Jewish law when the two come in conflict.

Contemporary Perspectives

Varying perspectives on Jewish law form the basis of the divisions between Conservative, Orthodox, Reform, and other types of Jews today. Orthodox Jewish theologians generally argue for strict adherence to Jewish law and believe that if it changes at all, it does so only very slowly. Conservative Jewish thinkers similarly value the observance of Jewish law, but most argue that it has always evolved over time and must continue to do so. Forward development of the law is most

necessary when the law itself causes harm or otherwise alienates individuals such as when it excludes women from ritual practice. Reform Jewish leaders generally distinguish between Jewish law relating to ritual matters and Jewish law relating to ethical behavior. They claim that the level of adherence to Jewish law on ritual matters should be determined by the individual and that Jews today only have an obligation to observe Jewish law with respect to ethical behavior. Of all groups, the Reform movement sees Jewish law as the most fluid and open to change. Individual Jews identifying with any one of these movements may or may not observe Jewish law in the ways suggested by the theologians of the movement.

Westerners are used to a divide between the public and private spheres, with law governing only the public and saying little about private behavior. Consequently, individuals steeped in classic Western tradition often have a difficult time appreciating the vast reach of Jewish law into even the most intimate matters an individual may face. For those who do adhere to Jewish law, discrepancies between legal requirements and personal practice can cause significant anxiety that is often underestimated by outsiders who are not accustomed to a legal system governing private matters.

One's adherence to Jewish law is measured strictly in terms of one's behavior. Consequently, one may be considered a pious practitioner of the tradition in the absence of underlying belief. This prioritization of action over creed explains why many Jews today consider themselves agnostic, atheistic, or otherwise doubtful of traditional theological claims yet still feel deeply committed to particular religious practices. The apparent disconnect between belief and action can appear illogical or sometimes even hypocritical to the outsider who may expect faith to serve as the primary motivation for religious action.

Jewish Mourning Rituals

Mark Popovsky
 Department of Pastoral Care, Weill Medical
 College of Cornell, New York Presbyterian
 Hospital – Chaplaincy, New York, NY, USA

Ritual practices surrounding death and bereavement are strictly observed by many modern Jews, even those who have abandoned traditional behaviors in other aspects of their lives. Prior to death, the custom is for the dying person to recite a brief confessional prayer called the *vidui* in order that he or she leaves this world with no guilt or sin. There are, however, no theological consequences if this prayer is not offered.

Prior to Burial

Immediately following death, utmost care is taken to preserve the dignity of the corpse. It is covered with a sheet and never left unattended from the moment of death until the moment of burial. Those who accompany the body during this period are expected to recite Psalms and refrain from casual conversation. Jewish tradition considers the body as belonging to God and only “on loan” to human beings while alive. Consequently, following death when the body returns to divine care, it must remain as intact as possible. For this reason, autopsies and other postmortem procedures are strictly forbidden except when required by civil law or done for the express

purpose of saving someone else’s life, as in the case of organ donation. Similarly, cremation is traditionally avoided on the grounds that no one other than God has the right to destroy the body.

Because the body is not embalmed, burial is done as quickly as possible, usually within 24–48 h barring exceptional circumstances. In the time prior to interment, a volunteer group called the *hevra kadisha* (“sacred society”) washes the body thoroughly and immerses the corpse in ritually pure water. They wrap the body in shrouds and sometimes also a prayer shawl. No other clothes are worn to show that all people are equal in death, regardless of wealth or social status.

Burial and Funeral

So that the body may return to the earth without hindrance, no objects are buried with the corpse. In Israel, no coffin is used. In Western countries where coffins are required by law, a simple pine box is permitted. It is sealed by the *hevra kadisha* when they finish preparing the body. Open caskets at the funeral are not permissible under strict Jewish law.

Prior to the funeral, mourners will rend a garment or tear a black ribbon pinned over the heart as a sign of grief. Interment follows a simple service with prayers and eulogies. Because it is a religious obligation for members of a community to care for those who have died, all those present at the graveside share the responsibility of burying the body by each shoveling earth directly into the grave until the coffin is completely covered. This practice forces mourners to confront the finality of their loss; denial becomes impossible. Jewish graves are traditionally marked with a simple headstone again symbolizing human equality in the face of death.

After Burial

For the 7 days following burial, immediate family members will observe *shiva* – a custom

in which they remain at home, refrain from unnecessary work, and receive visitors. The community has the obligation to ensure that the family is well fed and always has sufficient numbers in the home for a prayer quorum. The continual presence of visitors generally prevents mourners from retreating into isolation or self-destructive behavior. Mourners sit on low stools to signal their discomfort. Mirrors in the home are usually covered as a rejection of vanity at a time of such intense grief. Visitors offer a simple blessing and avoid casual conversation, focusing instead on remembering the deceased and listening to the mourners describe their experience.

In the 30 days following burial, traditional mourners will refrain from sexual activity, shaving, or attending joyous events such as weddings or concerts. At the end of 30 days, these restrictions relax; however, the children of the deceased continue in an extended bereavement period in which a prayer called the *kaddish*, first recited at the graveside, is offered thrice daily during the year following the death. Because the prayer may only be recited as part of a group of ten, this tradition compels mourners to attend synagogue and avoid the social isolation that often accompanies grief. On each anniversary of the death, the mourner lights a memorial candle in the home and recites the *kaddish* prayer in synagogue.

Jewish Reconstructionism

Nicole Gehl

The Priory Hospital, London, UK

Reconstructionism is the fourth major denomination of Judaism and was introduced by Lithuanian-born Rabbi Mordecai Kaplan (1881–1983) in the 1920s in America. It is the only major sect of Judaism to originate inside the United States, and the movement has had little reach beyond American borders. Rabbi Kaplan began his career as an Orthodox rabbi, but his dissatisfaction with Orthodoxy brought him to the Conservative rabbinical seminary where he retained a tenureship for 54 years. In this position, he taught Judaism as an ever-evolving civilization and asserted the need for Jewish people to reexamine the practices and customs of traditional Judaism in light of the changes and advances of the times. Kaplan sought to change the emphasis of Conservative Judaism so that it would appeal to Jews who had become psychologically and spiritually distant from their heritage. It was his belief that Judaism had persisted for thousands of years despite the adversities the Jewish people were subjected to because they held the belief that following tenets of Judaism would translate into otherworldly salvation. Kaplan asserted that modern Jews no longer believe in otherworldly salvation, and so for Judaism to remain relevant within the psyche of the Jewish people, it needed to be redefined “into a religion which can help Jews attain this-worldly salvation” (Kaplan 1962, p. viii).

The essence of G-d for Kaplan was something which man can never understand and therefore not of his concern. Rather his interest was in the psychosocial purpose G-d has in man’s life. With this as his aim he founded the Society for the Advancement of Judaism, setting out to “reconstruct” Judaism as it was lived within twentieth-century American culture. Although it was not Kaplan’s original intention to establish a new denomination of Judaism, its

necessity became apparent to his supporters, and in 1940 the Jewish Reconstructionist Foundation was established.

Kaplan controversially rejected many principles of Jewish belief, including the concept of chosenness, a personal messiah, and rabbinic authority. The absence of these traditionally Jewish tenets, some of which have been cited as the location of the focus of anti-Semitism, has particular implications on the self-identity of Reconstructionist Jews. The great conflict between Reconstructionism and Orthodox Judaism is that theology is not at the center of the Reconstructionist movement and *halaka* are apprehended of as “folkways,” rather than binding tenets of Judaism. The Torah is seen by Reconstructionist Jews as the response of the Jewish people to G-d’s presence, rather than a gift from G-d to his chosen people. Likewise, the *mitzvot* (commandments) are believed to be of human invention. Religion for Kaplan is a psychosocial phenomenon based on “neither belief, nor tenet, nor practice, but rather the continuous life of the Jewish people” (Liebman 1970, p. 7).

The matter of gender equality is greatly emphasized within the Reconstructionist movement; female rabbis have been ordained by the Reconstructionist Rabbinical College since its conception, and it was Kaplan’s own daughter who underwent the first Bat Mitzvah ceremony (analogous to the traditional Bar Mitzvah signifying a boy’s transition to adulthood) to mark her coming of age. Kaplan’s reworking of the Haggadah “the New Haggadah” and “The Sabbath prayer book” eliminates ideas and beliefs from the classical frameworks that are inconsistent with the beliefs of the Reconstructionist institution and maintain gender neutrality. Unlike the Reform movement, Reconstructionism advocates the performance of traditions and practices of Judaism for the purpose of maintaining unity and connection for the Jewish people and suggests that “folkways” should be undertaken unless there is a good reason not to do so. As such, the traditional Jewish rituals are most central to Reconstructionist thought and routine. Hebrew is largely used in the liturgy, yarmulkes are worn, and the observance of Sabbath and dietary restrictions are encouraged; however, it is left to the individual congregations to choose democratically.

The Reconstructionist movement has continued to evolve with the times, and in recent years Kaplan’s successors have returned their attention to spiritual and mystical matters of Jewish thought. From a psychological standpoint, there are particular implications of the Reconstructionist rejection of the identity of the Jews as a chosen people. Reconstructionist Jews are more likely to view themselves as having a bicultural identity than members of other denominations of Judaism. American traditions of moral philosophy adapt well within the psyche of Reconstructionists, who perceive many beliefs and worldviews around *halacha* as outdated. The traditional values retain an importance as connections with the Jewish heritage but are married with a democratic approach. Reconstructionist Jewish identity is predicated, not on faith or belief in the supernatural but in psychological attachment to the Jewish people as a matter of feeling. The sect is alluring for Jews who find themselves in the quandary of finding their cultural heritage less meaningful and yet are unable to repudiate Jewish heritage without feelings of loss and spiritual incompleteness.

The most frequently leveled criticism of Reconstructionist Judaism is that as it is without concrete theories about G-d’s essence, it is not a theology and is rather a perspective on the psychological implications of ascribing to one. There continues to be variations across populations, much like other denominations of Judaism, and due to this, it has been stated that there is not a single definition to the Reconstructionist idea of G-d. Mental health practitioners then, working with Reconstructionist Jews, should have at least a basic understanding of Judaism but also be prepared to inquire about the client’s particular sense of identity and where they see themselves within the Jewish Reconstructionist community.

Jewish Sexual Mores

Mark Popovsky
Department of Pastoral Care, Weill Medical
College of Cornell, New York Presbyterian
Hospital – Chaplaincy, New York, NY, USA

Classical Jewish tradition contains a wide spectrum of opinions about sexuality and sexual ethics. All rabbinic authorities share the core belief that sexual desire is natural and should be expressed through licit sexual behavior. The majority of traditional voices find nothing shameful about permissible sexual activity. To the contrary, most rabbis claim that sex can be sacred and holy when accompanied by the proper intention.

The first commandment humans receive in the Bible is “to be fruitful and multiply.” This has been interpreted as a religious obligation to marry and attempt to have children. However, reproduction is not the sole purpose of sex in classical Jewish thought. Sexual pleasure, relief from desire, and the health benefits of sexual activity are often cited in rabbinic literature as reasons to engage in sexual intercourse even in situations when procreation is not possible.

Jewish law, in fact, provides a wife with conjugal rights that continue after menopause which entitle her to a certain amount of sexual activity proportional to her husband’s age, health, and professional duties. Though some threads of asceticism exist in the tradition, celibacy is generally considered a rejection of God’s will that humans should function as sexual beings.

Ejaculation outside of intercourse, however, is considered problematic because it involves the unnecessary destruction of sacred material that has the potential to become life. This concern underlies the classical prohibitions against masturbation and the use of contraception. The prohibition against contraception does not outweigh the imperative in Judaism to pursue good health; consequently, contraception is permitted, even in the most restrictive Jewish communities, when it is necessary to ensure the physical health or mental well-being of the individual.

While the Bible includes no direct prohibition against unmarried individuals engaging in consensual sexual intercourse, later rabbinic tradition makes clear that the ideal sexual relationship occurs within the context of marriage. Divorce is considered a tragedy in Jewish tradition but not a sin. While social stigma persists in some insular Jewish communities, classical sources unanimously view the dissolution of marriage as consistent with divine will when one or both parties are suffering. Sex outside of marriage is discouraged in Jewish law. To avoid sexual temptation, many Orthodox communities observe practices which prohibit unmarried individuals of the opposite sex from remaining alone in a room together or even casually touching each other. Liberal Jewish communities have abandoned these practices and generally are quite tolerant of monogamous consensual sexual relationships prior to marriage. Adulterous and incestuous relationships are punishable by death according to biblical law and have remained strictly forbidden throughout Jewish tradition.

Even within marriage, Jewish law governs sexual behavior. Jewish tradition has preserved the biblical prohibition against sexual intercourse during and immediately after menstruation. Observant couples will abstain from sex for up to 7 days following the cessation of menstrual

flow. On the seventh blood-free day, the woman immerses in a ritual bath prior to resuming sexual relations. While this practice has fallen into disuse among many modern Jews, recent creative reinterpretations of the ritual have revived its observance in some liberal communities.

The Bible explicitly prohibits a man from “lying with a man as he would with a woman.” While scholars debate what this meant in its original context, it has been traditionally interpreted as forbidding male homosexual sex. Later rabbis similarly forbade lesbian sex, though this prohibition carries less weight. In modern times, many liberal Jewish authorities have sought to limit or altogether overturn these prohibitions.

Jewish Tradition and the Environment

Kalman J. Kaplan¹, Paul Cantz² and Matthew B. Schwartz³

¹Departments of Psychiatry and Medical Education, University of Illinois in Chicago, Chicago, IL, USA

²Department of Psychiatry, University of Illinois at Chicago College of Medicine and Adler School of Professional Psychology, Chicago, IL, USA

³Department of History, Wayne State University, Detroit, MI, USA

The essence of the Biblical/Jewish psychological approach to the environment becomes clearest when compared to the psychological view of the

environment emerging from ancient Greek religion/mythology. The Greek mythological view portrays Gaia as “mother earth” and vacillates between worshiping the environment and ravaging it. Like woman, the earth is either to be idealized or raped. This entry will demonstrate this vacillation in the ancient records regarding Greek and Roman treatment of the environment.

The Biblical world does not see the earth in this psychological manner. God has created the world, both the heavens and the earth. The earth is not seen as a mother, and it is to be treated respectfully, not worshiped or raped. Athens and Jerusalem thus represent two contrasting psychologies regarding the earth and life upon it which are of vast importance to modern attitudes toward the environment. Let us compare these two different psychologies in more detail.

Greek and Biblical creation stories embody two radically different worldviews regarding the relationship between God (gods), nature, and the human being. Nature precedes the gods in the Olympian *Theogony*: “First of all there came Chaos” (p. 130), while God creates nature in the Biblical account: “When God began to create heaven and earth. . .” (Genesis 1). This results in two different views of the relationship of the human being and his environment. For example, Zeus capriciously withholds knowledge of fire from man, thereby keeping humankind subservient. Prometheus surreptitiously steals it back to promote human independence (Ovid 1989, lines 76–86). In stark contrast, the rabbinic sages portray the Biblical God in decidedly more compassionate terms, providing the means for Adam to invent fire (Freedman et al. 1939, 11:2).

It is impossible to overestimate the importance of fire to primitive man. Primitive human beings were dominated by nature. Day and night are different worlds. The sunlight of day provides people with light and heat, enabling them to distinguish land from water and friendly animals and people from predatory and dangerous ones, and providing relief from cold. At night, the sun hides, and man is rendered helpless. But fire changes this. It generates light and heat to hold the environment at bay. Fire enables man to separate the light from the dark and civilization from

wilderness. It also enables him to forge and sharpen weapons, cooking utensils, and medicinal treatments; make wheels; and cook and sanitize food. It enables man to constructively make his environment more inhabitable. Yet Zeus attempts to withhold this knowledge, while the Biblical God willingly gives it to Adam and Eve after their expulsion from Eden.

How do these stories impact on Graeco-Roman views of the environment? There is no simple answer to this question, although when we examine the evidence, we find a peculiar ambivalence. On the one hand, Earth, *Gaia*, was seen as the mother of gods, humans, and every living thing (*Homeric Hymns*, 30.1). As such, she should be worshiped and not altered in any way that upsets an abstract balance. On the other hand, many of her offspring were monsters, and her fecundity had a dark side.

As evidence for the idealizing pole, the environmental historian J. Donald Hughes (1996) argues in *Pan's Travail: Environmental Problems in Ancient Greece and Rome* that “the Greeks in particular thought that rearranging land and sea was a prideful challenge to Zeus, who had ratified their limits when he divided the world with his brothers” (p. 51). Hughes offers the following example to support this thesis. When the people of Cnidus tried to dig a canal through the neck of land that connected them to Asia Minor, many injuries occurred to the workmen from flying rock splinters. They received the following explanation from the Oracle of Delphi: “Do not fence off the isthmus, do not dig. Zeus would have made an island had he willed it” (Herodotus 1975, line 174). They stopped work immediately. Along these lines, Hughes adds that during the invasion of Greece by the Persian king Xerxes, it was regarded as evidence of “pride going before a fall” that he had built a bridge of boats across the Hellespont, turning sea into land, and that he caused a canal to be cut through the Athos peninsula (Strabo 1854–1857, 14.2.5).

On the other hand, the Greek attitude toward the earth sometimes oscillates to the opposite extreme. While being aware of how to treat the soil (Hesiod 1991, line 464; White 1970, p. 177; Xenophon 1971, pp. 5–12), and the importance of

fallowing the land and also crop rotation where soil-restoring legumes were planted in alternate years with other crops (Theophrastus 1976–1990, 4.7.3, 4.8.1–4.8.3; Theophrastus 1916, 8.11.8), Hughes suggests that “their use in the Mediterranean was limited by the small size of farms and the necessity of planting each species only where soil and exposure would favor it” (Hughes 1996, pp. 139–140; Pliny the Elder 1855–1857, 18.91; Vergil 1931, lines 73–75).

Though scientifically advanced, the Greeks and later the Romans seemed to have been quite indifferent regarding certain ravages to their environment. Hughes points in particular to the problems of deforestation, overgrazing, and erosion. Plato, for example, observed that the heavily forested mountains of Attica had been laid bare by the cutting of timber and by grazing, resulting in an erosion of the rich and deep soil. As a consequence, the springs and streams had dried up (Taylor 1929, 11b–d). Strabo offered a similar analysis, maintaining that the forests near Pisa had been exhausted by shipbuilding and the construction of buildings in Rome and villas in the surrounding countryside (Strabo 1854–1857, 5.2.5).

A number of themes stand out in the Greek narratives:

1. Earth and sky exist prior to the gods and in fact create them. *Chaos* must be subdued for this process to occur.
2. The Earth Mother is a very ambivalent source. She gives life but also destroys it.
3. Zeus is trying to keep man dependent, sending him woman as a punishment for his gaining fire, which would have enabled him to control nature in a healthy way.
4. Man vacillates between idealizing and worshipping the earth and, conversely, ravaging and raping it.

The Biblical account is very different. God creates human beings, male and female, His ultimate handiwork, in His own image and gives them dominion over all in nature. He has created (Genesis 1). The Bible describes the world and all that is in it as created by God in love. Humankind

was given dominion over all, and the first people were placed in the Garden of Eden “to till it and tend it” (Genesis 2:15). It is incumbent on humanity not to wantonly destroy. Having dominion does not entitle man to misuse nature. Nature is not presented as something alien to man; it is neither to be worshiped nor raped, but instead tended and cared for lovingly and carefully. The land of Israel was to lie fallow one year out of every seven, and although the purpose was not specifically the replenishment of the soil, replenishment would serve as one benefit (Leviticus 25:2–7). “You shall not destroy” (*LoTashchit*) (Deuteronomy 20:19–20) is stated in the context of destroying trees but is understood in the rabbinic literature as including all sorts of wanton destruction. All that God created has its own purpose and beauty. A well-known Midrash recounts that David once did not understand why God needed to create spiders. Then a spider spun a web over the entrance to a cave where David was hiding so that his pursuers would not think of looking for him there (Midrash Alpha Beta Acheres d’Ben Sira 9).

The medieval *Sefer Hachinuch* (1988, line 529) writes that the essence of this law is to teach people to love what is good and beneficial and to take care of it. “It is the way of pious people who love peace and rejoice in the good of the Creation that they would not destroy even a mustard seed and they will do all in their power to prevent needless destruction.”

In the same line of thinking, the Talmud (Talmud Bavli 1989–1999, *Shabbat* 105b) says that one who destroys anything in anger is as though guilty of worshipping idols, in the sense that he obeys the destructive urges in his nature rather than connecting with God and the wonders of His creation.

At the direct practical level, there are dozens of Biblical laws that regulate in great detail what we may and may not do to the environment. The Hebrew Scriptures prohibits the crossbreeding of different species of animals (Leviticus 19:19), and it bans the transplanting of branches of differing species of fruit trees (Leviticus 19:19, as per Maimonides, *Book of Commandments*, negative commandment no. 216) and the intermingling of seeds

in planting (Deuteronomy 22:9). Having dominion does not entitle man to misuse nature, but rather exercise an attitude of respect and even awe, a notion that carries over into Jewish law which mandates individuals to recite blessings for all manner of natural phenomena (rainbow, lightning, shooting stars, the first blossoms of a tree, etc.).

Likewise, the Hebrew Bible prohibits various forms of activities that would involve cruelty to animals (Shochet 1984). We may not harness together animals of different species (Deuteronomy 22:6–7); we may not pass by an animal which has collapsed under its load, but are duty-bound to help it (Exodus 23:5, Deuteronomy 22:4); we may not slaughter a mother and its young on the same day (Leviticus 22:28) as we may not take the fledglings while the mother bird hovers over them. On three occasions, the Scripture warns against cooking the kid in its mother’s milk (Deuteronomy 14:21; Exodus 23:19, 34:26).

It is clear then that nature is not to be ravaged, but neither is it to be worshiped. There are times when trees must be cut down, in the service of human progress. Yet at the same time, all of God’s creation is entitled to be protected from wanton destruction. This is the rabbinic understanding of the *Lo’ Taschit* (“You shall not destroy”) verse in Deuteronomy that literally bans *only* the destruction of *fruit-bearing* trees during war. Other trees may be destroyed and cut down in order to build bulwarks against the city that wars against one (Sifrei to Deut 20:19–20, Finkelstein edition of Sifrei Devaraim, pp. 238–240). Some Talmudic writings even give explicit permission to alter the environment if it is in the service of advancing human welfare. For example, the protection even of fruit-growing trees may be overridden by economic need (Talmud Bavli 1989–1999, *Bava Kamma* 91b–92a). Alteration or even destruction of parts of the environment for protection of health is permissible (Talmud Bavli 1989–1999, *Shabbat* 128b–129a). In short, human needs must always be balanced against environmental concerns.

Yet it is God and not humanity that is the eternal owner of all the earth. The Biblical God does not attempt to withhold the knowledge of fire

from man, as has Zeus, instead encouraging man to incrementally improve on the environment as long as he does so responsibly with a respectful stewardship rather than insisting on an absolutist environmentalism or, worse, blind worship of nature. Environmental concerns must always be calibrated against human needs, and in the final analysis human needs will prevail. In the words of Rabbi Joseph B. Soloveitchik, a great twentieth-century interpreter of Jewish law, there is an unavoidable dynamic tension between the capacity to exercise control over nature and the duty to act toward nature with a sense of fiduciary responsibility.

The following points stand out in these Biblical narratives:

1. God exists prior to the heaven and earth and in fact creates them. The world was at first unformed (*tohu vovohu*) and must be given form and structure rather than subdued.
2. Earth is not seen in sexually differentiated terms. There is no sense of an Earth Mother. The Biblical God creates man to tend and care for the world He has created.
3. The Biblical God is not seen as trying to keep man dependent. He gives man the gift of fire to enable him to help make nature inhabitable.
4. Human beings need not and indeed must not worship the earth or nature. Neither are they free to misuse, rape, or ravage it.

Jihad

David A. Leeming
University of Connecticut, Storrs, CT, USA
Blanton-Peale Institute, New York, NY, USA

Jihad is the Arabic word for the Muslim concept of holy war. Jihad can be a spiritual and physical war against infidels – nonbelievers – or it can be an inner war against temptation and sin.

The physical jihad is communal, pitting an Islamic culture in a crusade of sorts against non-Islamic cultures or against Muslims seen to be in a state of apostasy. In some cases, jihad of this sort involves activities that many Muslims would consider un-Islamic activities such as suicide and the killing of innocents. Jihad of this sort, known by different names, is common to all religions and cultures. The medieval crusades of European Christians were jihadist in effect. Jews, Christians, Hindus, and Buddhists, as well as animistic peoples, have all waged war in the name of their religions. Jihad of this sort assumes a natural superiority of one religion over all others and can, of course, lead to unspeakable acts and immense destruction and pain.

Inner jihad, known by Muslims as “the greater jihad,” is also common, under other names, to most religions. Christians, Jews, Hindus, Buddhists, and others all subscribe to inner searching and inner struggles against thoughts and

tendencies that interfere with what are considered religious-based moral standards.

Psychologically, the jihad that involves actual warfare and killing is often a projection of a communal feeling of arrogance or, more often, of frustration and depression resulting from injustice. The kind that involves such activities as suicide bombing and the glorification of “martyrdom” or the senseless killing of innocents, whether practiced by splinter groups or nations, is an ultimate expression of such arrogance or such depression and frustration.

Inner jihad, whether practiced by Muslims or others, is psychologically based in the universal human desire for wholeness, for the development of self in the face of powers within and without that would repress and deny that development.

Job

Ingeborg del Rosario
Emmaus Center, Quezon City, Philippines

The *Book of Job* is part of the Wisdom literature of the Hebrew Scriptures or the Old Testament of the Christian Scriptures. Two distinct sections of the

Book of Job are easily identified, given their differing literary style and content. The prologue (Job 1–2) and the epilogue (Job 42:7–17) are written in prose narrative, while the main body of the text (Job 3–42:6) comprises the poetic dialogues. The poetic section includes the dialogues between Job and his friends (Job 3–37) and, at the climax of the book, the divine speeches, with God speaking out of the whirlwind (Job 38–41) and Job’s responses (40:3–5; 42:1–6). While the prose and poetic sections are most probably of diverse authorship and historical origin, the book is best read as a coherent story. The *Book of Job* is a literary drama built around Job, a mythic figure who serves as an archetype for the human in search for religious and existential meaning in the face of undeserved suffering, an experience replicated endlessly throughout time and across all cultures. Job’s story is the story of everyman and everywoman who have tried to make sense of senseless, innocent suffering and who have tried to keep faith and hope alive in unendurable agony when hopelessness and despair seem to prevail.

While the *Book of Job* belongs to the Wisdom tradition, it challenged conventional religious wisdom that held that righteousness leads to prosperity while wickedness leads to misfortune. By way of retribution, good is rewarded; wrongdoing is punished. The traditional moral belief was that suffering was the result of sinfulness; therefore, if one suffers, one must have done evil and sinned. The story of Job confronts these beliefs that continue to exist into the present time, pervading consciousness and culture. Job’s story is the universal narrative of the innocent who is honest and righteous yet horribly afflicted and who has not greatly sinned nor done evil yet grievously suffer. The opening line of the *Book of Job* is laden with meaning: “There was once a man in the land of Uz whose name was Job. That man was blameless and upright; one who feared God and turned away from evil” (Job 1:1). An emphatic, forward-looking declaration is made in this description of Job that whatever is to happen next to Job does not happen because he has done anything wrong to deserve it. Job is not to blame for the agonizing pain and suffering he is about to endure.

Following the dialogue between God and Satan where, following Satan’s challenge, God allows the testing of Job (1:6–12; 2:1–6), a searing succession of tragic events unfolds for Job. He first loses his entire livestock and all the servants who cared for them. Then, in one fell swoop, all his sons and daughters perish. While he is grieving these horrific losses, he is afflicted with a leprous disease that scars him and marks him as an outcast from his community (1:13–19; 2:7). All which Job possesses, he loses. Engulfed by enormous anguish, Job is plunged into the silence of helplessness and despair for 7 days and nights. Head shaven and clothes torn asunder, Job is left wordless, sitting upon an ash heap (2:8–13). While his three friends first come to comfort him, sitting with him in his agony, they then confront Job, blaming him for causing his own misery, calling on him to recognize his sinfulness as the reason for his suffering:

Think now, who that was innocent ever perished?
Or where were the upright cut off? As I have seen,
those who plow iniquity and sow trouble reap the same.
By the breath of God they perish, and by the blast
of his anger they are consumed (4:7–8).

For you say, ‘My conduct is pure, and I am clean
in God’s sight’. But, oh, that God would speak,
and open his lips to you, and that he would tell you
the secrets of wisdom! For wisdom is many-sided.
Know then that God exacts of you less than your
guilt deserves (11:4–6).

Is it for your piety that God reproves you, and
enters into judgment with you? Is not your wicked-
ness great? There is no end to your iniquities
(22:4–5).

Individuals afflicted by tragedy and loss, even if this be by natural cause or calamity, often carry the additional emotional burden that comes with wondering if they might have caused or been responsible for their suffering. Patients who have suffered childhood trauma and abuse often blame themselves for the cruelty and violence they experienced, believing on an affective level that they somehow caused this to happen, permitted it to continue, and did not do enough to make it stop. Therapeutically, the tendency towards self-blame can be understood as a way of defense and self-protection for the patient dealing with abuse and trauma. By blaming themselves, patients need not acknowledge the more awful realization that they

were helpless, trapped in a situation that was out of their control. How much less terrifying it is to blame self and claim power, agency, and responsibility over what happened than to confront enormous grief and anger at the betrayal of those responsible for the abuse.

The tragic experiences of Job in the opening narrative also outline what is characteristic of trauma as it can be clinically understood. A traumatic event is extreme and terrifying, sudden and unpredictable, involving exposure to witness or threat of serious injury or death to oneself or to others (DSM-IV 1994). Such unexpected, unfathomable experiences that threaten life and boundaries of self can inundate and overwhelm physical and psycho-emotional resources, evoking responses of great horror, fear and terror, helplessness, and powerlessness. Trauma also upends foundational assumptions affectively formed from early on one's sense of self-worth, security, competency, and mastery; beliefs in the reliability, goodness, and trustworthiness of others; and assumptions that the world is safe, fair and just, orderly, and predictable and that life has inherent balance, purposefulness, and meaning. Trauma shatters these beliefs and assumptions that had created stability in the present and provided a sense of hopefulness for the future. In the figure of Job is held a template of trauma: religious patients who have experienced trauma resonate with the impact of the tragic events that befell Job; his deep sense of horror, anguish, and helplessness at their unfolding; and the shattering of religious beliefs and God assumptions that had provided order and meaning to life. In the way of Job, patients can sit in and be with the speechlessness of their overwhelming pain and suffering. In the therapeutic space, the analyst is challenged to reverently witness to the unspeakableness of the trauma's impact, sharing in the terror and horror, helplessness, and powerlessness that demand venerable, vulnerable silence, as well as the empathy of presence, rather than facile interpretations and anxious interventions.

The *Book of Job* is replete with God questions, queries about the nature of God, and how divine

activity is perceived and experienced. The succession of tragic events that befall Job is set off by God's innocent questions to Satan: "Where have you come from? ... Have you considered my servant Job?" (1:7-8; 2:2-3) and Satan's challenging repartee: "Does Job fear God for nothing?" (1:9). In the midst of his anguish, Job raises his own questions and challenges to God: "Why have you made me your target? Why have I become a burden to you?" (7:20); "Why do you hide your face from me and count me as your enemy?" (12:24); "Why do the wicked live on, reach old age and grow mighty in power?" (21:7); "Why are times not kept by the Almighty, and why do those who know him never see his days?" (24:1); "Did I not weep for those whose day was hard? Was not my soul grieved for the poor?" ... "Does he not see my ways, and number all my steps?" (30:25; 31:4). Midway into the *Book of Job* is a hymn to wisdom where lies a question twice repeated that reflects the profound depth of Job's spiritual quest in the midst of his suffering: "Where shall wisdom be found and where is the place of understanding?" (28:12,20). God responds out of the whirlwind, claiming the divine right to inquire, also inundating Job with questions: "Who is this that darkens counsel by words without knowledge? ... I will question you, and you shall declare to me. Where were you when I laid the foundation of the earth?" (38:2-3). God's questions to Job come one after another, besieging and beleaguering, leaving him speechless, with hand over his mouth (40:4-5); yet, in the epilogue, God affirms that Job's persistent questioning towards a more radical, liberating understanding of the divine ways was a way of right speech about God (42:8).

Experiences of trauma and suffering can precipitate the doubt and challenge of traditional religious beliefs, in one's questioning one's understanding of God, the nature of divine power and authority over universal order, human freedom, and will. The *Book of Job* highlights the value of questing and questioning, of going beyond the bounds of what is known and conventional towards an authentic inquiry that dares enter the ineffable realm of mystery encountering the

limitless, complex possibilities God, delving into the immeasurable depth of the divine-human relationship. From a space of integrity in the search for truth, one may discover a God one cannot limit, hold, or control: God elusive and enigmatic, paradoxical and contradictory, and God unfettered and radically free. Job's experience of God who is both oppressor (6:4) and protector (14:13), persecutor (19:6–22) and redeemer (19:25–27), and enemy (13:24) and friend (29:4) manifests divine incongruity. Carl Jung describes this experience as an antinomy, God as a totality of inner opposites, and God who is everything in all its fullness. The prologue foreshadows this incongruity of God and the divine ways, when it describes God as having destroyed Job *hinnam*, “for no reason” (2:3). While God is apprehensible, God cannot be fully known, contained, or fathomed, for God is radically free, totally Other, and ultimately irreducible to the established bounds of belief systems. The cosmic order also reflects the divine nature. Job is turned over to the power of Satan, the Hebrew translation of which is closer to adversary: Job, as with all humans, will inevitably meet chaos, struggle, and adversity, an intrinsic part of life's free, consequential unfolding.

While some religious patients who grapple with trauma, chronic suffering, and even the adversarial encounters of daily life find consolation in their religious tradition, others may rigidly hold on to beliefs that deny the complexity of human experience, refuse to acknowledge the expanse of divine mystery, and consolidate feelings of self-blame, inadequacy, shame, and guilt. The process of facilitating the creation and holding of an inner space enough for patients to notice their beliefs and observe how they come to believe without harshness of judgment or self-criticism can be painstakingly slow. The therapist does not engage in intellectual debates over the rightness or wrongness of particular beliefs but is challenged to facilitate gentle inquiry into the nature of beliefs, exploring their evolution and development in the faith story of the religious patient. Because religious beliefs provide an affective level of grounding and foundation, the patient's

inquiry into these beliefs that is usually precipitated by experiences of suffering can cause profound restlessness and disorientation, anxiety, and grief. As with the figure of Job who confronted the incongruity of his beliefs and experiences and was transformed in the process of doubt and disquiet, questing and questioning towards a qualitatively new way of understanding self and God, so too are religious patients invited into a space of unbridled curiosity and wonder, of unfettered interest and inquiry, to look beyond conventional answers that no longer engage their existential questions and experiences. Such is the powerfully transformative way of “right speech” that affirms not only the complexity of God but also the complexity of self able to hold, contain, and live in the midst of mystery and unpredictability and in the adversity and incongruity of life.

John of the Cross

Ann Moir-Bussy

School of Social Sciences, University of Sunshine Coast, Sippy Downs, QLD, Australia

Life

Juan de Yepes (John of the Cross) was born in Fontiveros, Spain, in 1542. His father died soon after his birth and his mother struggled to look after her three sons. His mother moved to Medina del Campo, and John was placed in an orphanage where he stayed till his teens. He then became a nurse and attended a Jesuit college. He entered a Carmelite Monastery at the age of 21 in Toledo in Spain. Wanting a more rigorous spiritual life, John of the Cross was about to leave the order for a more secluded one, when he met Teresa of Avila who encouraged him to join her in Medina where she had founded a reformed group of Carmelite nuns. Together they then founded the reformed group of Discalced Carmelites for the Friars. Opposed to the reform, the friars in Toledo captured him in 1577 and imprisoned him for 9 months in a dark cell and treated him brutally. It was during this time he began to receive divine consolations and began to write some exquisite mystical poetry. He escaped in August 1578 and worked with Teresa of Avila to found more reformed monasteries of Discalced Carmelites.

Writings

John was charged with the spiritual direction of Teresa's sisters, and he taught and wrote maxims to guide them and began to write some major works on mysticism and contemplation. His major works included *The Ascent of Mount Carmel*, *The Dark Night of the Soul*, and *The Living Flame of Love* (Arraj 1986). His aim in his writings and teachings was to show his subjects the way to achieve divine union. This could only be achieved by a "complete and penetrating

detachment from all that is not God Himself" (Arraj 1986, p. 50). This emptying out John described as the "dark night of the soul," first purifying the senses and then through purification of the spirit. *The Ascent of Mt Carmel* begins with an explanation of his poem "On a Dark night" and was "an exposition of a diagram that St John had drawn illustrating how to ascend the mount of perfection" (Arraj 1986, p. 49). This work was not finished. *The Ascent-Dark Night* is a mixture of poetry and prose, psychological descriptions, and doctrine. The maxims in the writings are meant to be lived rather than intellectually understood. John of the Cross also left the following works:

1. An explanation of the "Spiritual Canticale," (a paraphrase of the Canticale of Canticles)
2. An explanation of the poem beginning "O living Flame of Love"
3. Some instructions and precautions on spiritual matters
4. Some 20 letters, sent mainly to his penitents
5. Poems
6. A collection of Spiritual Maxims (see the Catholic Encyclopedia)

John of the Cross lived a life of extreme austerity yet saw this as the path of submitting to the Divine in order to attain union. Towards the end of his life, after the death of Teresa, he was opposed by some of the members of the order he had founded. Again he was mistreated and became seriously ill and was moved to the monastery of Ubeda, where he died in 1591, aged 49 years.

Psychological Implications

It could be assumed that John's journey to contemplation and mysticism and Carl Jung's journey to individuation are similar processes. John's journey is another example of what can be seen as a universal psychic process. Both John and Jung cared for the psyche of other people. Both underwent an experience that was akin to the "dark night." Psychologically the dark night can

be described as letting go of one's ego. John spoke of total detachment; Jung sees it as a process of facing and accepting one's incompleteness, a time of holding the tension of the opposites and waiting for wholeness to emerge. Letting go implies working against our own unconscious outmoded attitudes, habits, and assumptions, withdrawing our projections and accepting the totality of who we are. Jung wrote, "The foremost of all illusions is that anything can ever satisfy anybody" (Jung 1969, Vol. 11). The discrimination of the opposites is a result of the *Dark Night of the Soul* and from it comes reunification of the opposing elements. This is similar to the purification of the senses described by John of the Cross. Greek myths also narrate the dark night, and psychologically they illustrate the process of development towards individuation. Examples of these myths are the Night Sea Crossing, The Descent of Inanna to the Underworld, and Persephone. Alchemical symbolism, used by Jung, shows the outcome of the dark night in the image of the *coniunctio* of King and Queen. This can be related to the divine union that takes place spiritually after one has persevered and lived through the dark night. Perceval's (or Parsifal's) journey in the Grail Legend also "personifies the principle of Christian consciousness confronted with the problem of *physis* and of evil... as if the dark aspect of divinity had attacked him, in order to awaken him to a more conscious religious attitude" (Jung and von Franz 1970). The dark night is somewhat like an initiation before being admitted to relationship with higher consciousness. The ego must be transformed if one is to abide in one's true nature. For John, this transformation takes place through contemplation, a loving gaze at God that leads to a mystical consciousness – where knowledge and love are combined.

Joy

Brent Dean Robbins

Department of Psychology, Point Park University,
Pittsburgh, PA, USA

Joy has been identified as a basic emotion in psychology (Ekman 1999). Basic emotions are characterized by universal signals, such as facial or vocal expressions or bodily comportments, which communicate the presence of the emotion to others and evoke the same or corresponding emotional states in others. As basic emotions, they are understood to form basic building blocks for more complex emotions. They share the quality of having distinct physiological, appraisal, cognitive, and perceptual patterns, and they occur early in development of human children. Basic emotions such as joy can be witnessed in other primates and even other mammals, and they tend to come on quickly and occur as a brief state of mind.

Joy differs from subjective well-being or happiness since the latter construct denotes a personality trait or an enduring state of mind rather than a

fleeting or temporary emotional state (Robbins 2006; Campos et al. 2013). As a basic emotion, joy appears early in the development of the child. Within the first month of life, infants begin to express social smiles, especially in response to interactions with caregivers (Messinger 2002). From early in development, children express joy in response to social situations and in response to achievement in the mastery of a skill, especially in the context of play (Aksan and Kochanska 2004). Using a standardized coding system, researchers have found that joy is an expression similar to other emotions, such as anger, disgust, fear, sadness, and surprise, which are found to be displayed in similar ways across cultures. Also, authentic expressions of joy, known as the “Duchenne smile” can be distinguished from false or voluntary smiles based on the muscles utilized in the expression of the smile (Keltner et al. 2003).

Whereas psychology has tended to emphasize joy as more fleeting basic emotion, religious traditions, on the other hand, have tended to emphasize a distinction between conditional states of pleasure and a more enduring, spiritual sense of joy. Within the Judeo-Christian tradition, joy has been used to describe the state of mind that occurs when God reveals Himself to human beings. This revelation of God to His human creatures, in turn, corresponds to a transformation of suffering and despair into celebration and gratitude (Moltmann 2015). In the Book of Job, the “triumph of the wicked” is deemed to be short-lived and “the joy of the impious but for a moment” (Job 20:5). Whereas, in the Psalms of David, a “fullness of joy” is described as the fruit of standing in God’s presence, and in God’s “right hand are pleasures for evermore” (Psalm 16:11).

Within the New Testament, Jesus instructs his disciples that he will depart from them but informs them that their sorrow and grief will be transformed into joy. “Amen, amen, I say to you,” Jesus is quoted by the Gospel of John, “you will weep and mourn, while the world rejoices; you will grieve, but your grief will become joy” (John 16:20). In this moment, Christ anticipates his death on the cross, but also the hope of his Resurrection. Therefore, for the Christian, the

image of the cross signified both the inevitable sufferings, trials, and injustices of the life of this world, as well as the enduring hope of victory against suffering and death through God’s love. At Pentecost, when the disciples received the Holy Spirit, the disciples were as “filled with joy and the holy spirit” (Acts 13:52), upon which their fear was transformed into courage to preach the gospel to the world. In Paul’s letter to the Galatians, joy is described as one of the fruits of the Holy Spirit, along with love, peace, patience, kindness, generosity, and faithfulness (Galatians 5:22).

In the Letter to the Hebrews, Paul emphasizes that discipline in virtue is a cause of pain and suffering, but the “peaceful fruit of righteousness to those who are trained in it,” transforms the agony of the disciple into joy (Hebrews 12:11). Paul’s teaching employs a theme found repeatedly in the Old Testament book of Proverbs, “The sin of the wicked is a trip, but the just run along joyfully” (Proverbs 29:6). In his Letter to the Corinthians, Paul describes the manifestation of righteousness through the expression of the theological virtues of faith, hope, and love, but love is identified as “the greatest of these” (1 Corinthians 13:13). Within the Christian worldview, then, enduring joy is not to be found within the fleeting pleasures of worldly life, “but only as a feature of a flourishing life, a life that is lived well and that goes well. . .” (Moltmann 2015, pp. 10–11). Christian joy realizes itself in an ecstatic gesture of love, which goes out from the self toward the other and through the other, ultimately, to God. Through a life lived in the service of love, the Christian finds themselves caught up in the “joy of divine life,” in which “pain too will be caught up and gathered into joy, despair into hope, and temporal death into the joy of divine life” (Moltmann 2015, p. 15).

Within the Islamic tradition, we find a similar distinction between the fleeting joy of worldly pleasure and the enduring joy that erupts in relation to the Divine (Ghazi bin Muhammad 2014). The Arabic word for joy, *farah* in the negative context refers to the experience of those who “rejoice in the life of this world,” which is a brief “enjoyment” (Al-Ra’ad, 13:26). Within the

positive context, *farah* refers to the state of mind of those who rejoice “in the bounty of God, and in His mercy” (Yunus, 10:58). Only the latter, enduring state of joy leads to “happiness” (*‘sa’adah*), which can only be found in Paradise within the presence of God (Ghazi bin Muhammad 2014). Joy amounts to a giving of one’s self and is therefore the fruit of love, but a love for the world is disappointed due to its perishable nature, whereas love of God endures forever (Ghazi bin Muhammad 2014). Similar to the Judeo-Christian view, therefore enduring joy is discovered as the product of virtue, a rightly ordered life in the service of God as a gift of self, which is love.

Within the tradition of Buddhism, joy (*mudita*) is considered one of the four boundless qualities or four Brahma dwellings which lead to enlightenment, as outlined in the *Mettanisama Sutta* (Klein 2014). Freedom from the suffering of the ego is to be realized through two pathways, enlightened love (*bodhisitta*) and enlightened wisdom (*jnana*), and the four boundless qualities of equanimity (*upekkha*), love (*metta*), compassion (*karuna*), and joy (*mudita*) represent states of mind leading along these pathways by increasingly liberating the ego from its constraining boundaries and expanding the experience of the meditator. Through the recognition that all people seek happiness, equanimity leads to the first Buddha wisdom of sameness, recognition that all beings are empty and unchanging, and recognition of the second Buddha wisdom in which all beings possess Buddha nature. The virtue of love opens the Buddhist practitioner to an undistorted perception free of hatred and attachment, and the third Buddha nature of mirror-like wisdom. Compassion hopes for the freedom from suffering for all beings, and boundless joy rejoices in those who are free of suffering, which leads to the final Buddha wisdom, the all-accomplishing wisdom that transforms intention into action (Klein 2014).

The wisdom of these Western and Eastern religious traditions places emphasis on the importance of distinguishing between fleeting states of pleasure and an enduring, spiritual state of joy which is encountered through the cultivation of virtue. Similarly, existential psychologists, such as Rollo May (1981), stress the distinction

between, on the one hand, a happiness which is focused on the balance of pleasure and pain in one’s life, and, on the other, the experience of joy which delights in sheer possibility, even in the face of despair. Also in line with the wisdom traditions of East and West, existential and humanistic psychologies tend to emphasize the importance of cultivating virtue as the basis for a more joyful and vital existence (Robbins 2015) and view love as the central virtue necessary for this task (Robbins 2016).

Within the new subfield of positive psychology, empirical research has shown the importance of distinguishing between hedonic and eudaimonic conceptions of happiness. Whereas hedonic approaches stress a search for pleasure and the avoidance of pain; eudaimonic approaches define happiness as the realization of a flourishing life characterized by virtue (Huta and Ryan 2010). In line with religious and existential-humanistic perspectives, research indicates that people who seek hedonic well-being through the cultivation of virtue are able to realize higher levels of well-being, defined in terms of higher positive affect, being more carefree, having a sense of meaning in life, and having more vitality than those who stress only a hedonic sense of happiness (Huta and Ryan 2010). Research on state joy, defined as a more enduring and unconditional state of well-being, likewise, has been found to be associated with religious commitment, higher daily spiritual experiences, higher self-actualization, lower materialism, and greater sense of gratitude (Robbins 2018).

Qualitative research on the experience of joy supports the close link between the phenomenology of joy and common themes within spiritual experience (Robbins 2006). Joy was found to emerge in relation to a sense of awe and wonder, and a sense of gratitude for one’s existence. Participants described a sense of being centered or balanced, and a warm, powerful feeling emerging from the body and dissolving the sense of the self as a separate and bounded individual. As a result, participants felt a deeper sense of connection to other people and the natural world, and a profound sense of security yet openness. Joy was also found to occur within noninstrumental

states of consciousness and therefore resulted less from the achievement of an instrumental aim than a present-centered, mindful state of awareness. This present-centered awareness was described as coinciding with an altered sense of time, whereby time was experienced less as a sequence of events since each moment was felt as reflecting an awareness of being that was eternal and unchanging, similar to the Buddhist descriptions of equanimity. In these descriptions of joy, even though they were temporary states, the themes reflect the wisdom of the religious and existential-humanistic traditions which recognize joy's primary aim as one of greater openness to reality, an ecstatic relation of love to others, and a sense of security within a felt presence eternal and transcendent of the self.

Judaism and Christianity in Freudian Psychology

Richard Kradin

Departments of Medicine and Psychiatry,
Massachusetts General Hospital, Harvard
Medical School, Boston, MA, USA

Freud's perspectives on religion played an influential role in the development of psychoanalysis. In turn, psychoanalytic thinking has contributed to contemporary ideas on religion. Jakob Freud had already begun to distance his family from observant Judaism when his son, Sigismund Schlomo (Sigmund Freud), was born in Moravia

(current Czechoslovakia) in 1856. Whereas Sigmund claimed to have been denied the benefit of formal Jewish education, his assertion appears to be a pretense, as there is convincing evidence that Freud was exposed both to the ancient Hebrew language and to Jewish religious texts as a child.

Eastern Europe in the late nineteenth century was a hotbed of anti-Semitic fervor. Freud recounted his father's humiliating encounter with a young anti-Semitic street tough and suggested that his father's failure to defend himself had left the young Sigmund deeply disillusioned. He turned in fantasy to Hannibal's father – who had urged his own son to right the ancient wrongs done to Carthage by Rome – as a role model of proper masculine virility. The conflation of disappointment in his own Jewish father's perceived weakness and Christian bigotry continued to occupy Freud throughout his adult life.

Following a brief flirtation with religion as a young man, Freud professed a staunch atheism that never again wavered. As a young man, he took great pride in his Germanic heritage and thought of himself primarily as a “German Jew.” However, as anti-Semitic sentiments in Vienna grew increasingly overt, he ceased to identify himself as a “German” and viewed himself, as he confessed to his friend the Protestant pastor Oskar Pfister, primarily as a “Godless Jew.” His particularly fondness for Jewish humor formed the basis of his *Jokes and the Unconscious* (1905).

Judaism and Psychoanalysis

The members of Freud's inner circle of Viennese psychoanalysts were exclusively Jewish. This, and the fact that most of his early clientele were members of the Jewish bourgeoisie, prompted his non-Jewish critics to suggest that psychoanalysis was a “Jewish science” without wider applicability. Freud was concerned by these comments, as they threatened the broader acceptance of psychoanalysis. In response, he deliberately attempted to recruit non-Jewish practitioners to the new movement. He courted the support of the young Swiss psychiatrist Carl Jung, who had recently

published his observations on mental *complexes*, which Freud adopted as the physiological cause of why repressed mental contents would at times intrude into consciousness as parapraxes. But when Jung was appointed to a prominent leadership role within the psychoanalytic movement, Freud's Jewish colleagues expressed their dismay.

The Freud-Jung relationship was strained by a variety of factors, including their religious differences. Jung's rejection of Freud's definition of libido as overly limited eventually led to the complete rupture of their relationship (see Jung and Religion). Jung claimed that Freud viewed the unconscious as predominantly negative and that his ideas had been influenced by his Judaism. He further concluded that Freud's personality type (extraverted, thinking, sensation) had interfered with his capacity to appreciate religious sensibilities, except as a neurosis. Freud countered Jung's criticisms of *libido* in *On Narcissism* (1914) and never again seriously referred to his junior colleague's psychological contributions.

Freud and the Psychology of Religion

Freud authored three major theses that dealt primarily with religion. In *Totem and Taboo* (1913), he argued that religion represented a phase in the evolution of the psyche. His opinions followed those of the nineteenth-century British anthropologist E.B. Tylor, who argued that man's psychology evolved from a primitive phase of belief in magic to a phase dominated by religious beliefs. Modern man, according to Tylor and Freud, had recently achieved a more sophisticated perspective characterized by scientific thinking. According to Freud, these cultural phases parallel the ontogenetic psychological evolution of the man from the infantile stages of magical thinking, through childhood dependence, and mature self-reliance.

In this highly speculative treatise, Freud argued that proto-*Homo sapiens* lived in small hordes dominated by a single male who tended both to hoard the available women and to mate with them. Young males, distressed by their lot, banded together to kill their father and distributed

the females more equitably. However, according to Freud, the guilt related to acts of patricide and incest led to worship of the dead father and to specific taboos that formed the basis of religious behavior.

Totem and Taboo was criticized in academic circles for its lack of credible evidence, as well as for Freud's persistent adherence to the previously rejected theories of Lamarck, who had argued that memories of events could be genetically transmitted. Although modern field studies of great apes have confirmed that alpha-males do tend to dominate other males aggressively and to ward off their access to females, this is a far cry from concluding that such behavior has been the source of religious sensibility and practice.

In his *Notes upon a Case of Obsessional Neurosis* (1909), Freud compared religion, with its emphases on guilt and compulsive ritualistic behaviors, to obsessional neurosis. But by far his most damning and influential polemic against religion came in *Future of an Illusion* (1927), in which Freud argued that the image of God as a benevolent paternal figure was evidence of a persistent infantile wish – an illusion motivated by a need to identify a powerful figure that could protect one from the vicissitudes of nature, disease, and death. From Freud's perspective, the most appropriate response to religious beliefs was to expunge them, by identifying their roots in childhood fantasies and fostering confrontation with manifest reality. Although he admitted that patients might not necessarily be happier as a result of this exercise, it was, according to Freud, the obligation of the mature independent psyche to confront reality courageously. Only science, and not religion, could provide objective explanations of the real world, and as such, he concluded that the goals of science and religion were incompatible.

Freud's final critique of religion was completed shortly before his death. In *Moses and Monotheism* (1939), a set of three essays, he extended the ideas in *Totem and Taboo* specifically to the origins of Judaism. He argued that Moses was not a Jew, but an Egyptian who espoused monotheistic beliefs, and had offered them to a band of Jewish slaves that he subsequently freed from bondage in

Egypt. In their wanderings through the desert, the disgruntled Jews eventually murdered Moses, but their guilt subsequently led them to embrace his monotheistic beliefs and to adopt penitential taboos and ritual practices. As in *Totem and Taboo*, Freud offered no evidence for his theory, apart from that deduced from psychoanalytical inquiry. The work was controversial; it was poorly received by most academics and it angered religious Jews, who rejected it as heretical and nonsense.

Response to Freud

Jewish scholars remain split in their judgment of Freud – some have rejected his ideas as antithetical to those of Judaic culture, while others have attempted to integrate them into the larger fabric of Jewish thought. From a purely religious perspective, Freud's works are undeniably unyielding in their rejection of all modes of theism and incompatible with both observant Judaism and Christianity. In addition, Mordechai Rotenberg contends that Freud's focus on Darwinian struggle and oedipal conflicts, which emphasize the goal of the individual differentiating away from the group, runs counter to the core Jewish value of community. As Judaism is essentially a tribal religion, its continued survival depends on maintaining communal bonds. In this regard, Judaism stands in contradistinction to the goal of personal salvation that characterizes the Lutheran Protestantism. It is possible that Freud living in a Germanic world might have adopted and modified their values as a therapeutic goal.

Although widely criticized by religionists, anthropologists, and sociologists, Freud's psychological musings have been widely embraced by secular humanists. However, some have argued that Freud's conclusions are overly simplistic, as they ignore the importance of societal influences and reduce religious impulses to "nothing but" neurosis. From a phenomenological perspective, as William James suggests, religion is properly *sui generis*. Furthermore, from a pragmatist's perspective, religion can provide meaning and comfort for many and contribute

to a favorable quality of life. In adopting conscious rationality as a cardinal goal, Freud can be grouped with other post-Enlightenment secularists who denied the reality of innate irrational elements of mental experience.

In his monograph *A Godless Jew* (1987), Peter Gay ponders whether Freud's cultural Judaism may have been an element in the founding of psychoanalysis. Freud's Judaism potentially influenced psychoanalysis in many areas. In *Interpretation of Dreams* (1900), Freud examines the Old Testament dream interpretations of Joseph and Daniel and entertains the perspectives of Talmudic sages on dreams. Freud's view of the unconscious as the repository of repressed contents parallels the biblical reference to what God chooses to "reveal" versus "conceal." The idea viewing the manifest content as concealing a latent wish is highly suggestive of the style of midrashic exegesis of texts that was applied by the rabbis and later by the mystical Kabbalists. The Jewish exegetical tradition, like Freud, seeks to plumb texts for their deeper meaning. The modes of exegesis, often referred to by the acronym *PaRDeS* (*p'shat, remez, drash, sod*), refer, respectively, to the straightforward in-depth understanding of a revealed text, allegory, interpretive elaboration of the text, and its deepest secret meaning. All of these elements can be identified in Freud's interpretive technique.

Furthermore, many Kabbalistic theosophical interpretations are highly eroticized and include internecine conflicts between symbolic elements of the Godhead, comparable to the family "romance" of oedipal dynamics, in their symbolic efforts to elaborate the dynamics of the Godhead. The inheritors of the Kabbalistic tradition in Eastern Europe, the movement that became Hasidism in the eighteenth century, tended to psychologize these symbolic contents, much as Freud would later do. In this regard, it is noteworthy that Freud's father had been born into a Hasidic family, so that influences from that tradition would undoubtedly have had some influence on Freud's personal and cultural milieu.

The emphasis within mainstream Judaism on ethical humanism and legalisms, with a relative downplaying of both mystical beliefs and the

importance of the afterlife, may have fostered Freud's development of a "science" of mind that was predisposed to dismissing the irrational aspects of religion as illusory, as opposed, e.g., to the inherent mystery of the Christian trinity.

It is risky to attempt psychoanalytic explanations for Freud's disdain of religion beyond those openly admitted by him. But his views on religion appear to be rooted, in part, in his ambivalence towards his father, his own Jewish background, and his encounters with Christian anti-Semitism. When, at the end of his life, Freud found himself potentially ensnared by the Nazis in Austria, he managed to escape with his family to England, where he lived briefly until his death from oral cancer in 1939. While he never renounced his atheism, the elderly Freud increasingly expressed solidarity with the Jewish community.

Judaism and Christianity in Jungian Psychology

Richard Kradin

Departments of Medicine and Psychiatry,
Massachusetts General Hospital,
Harvard Medical School, Boston,
MA, USA

The Swiss psychiatrist Carl Gustav Jung (1875–1961) was a member of Freud's early psychoanalytical movement. However, he broke with Freud in 1912 over a variety of issues, including the importance of religion in psychological life. Jung viewed the religious impulse as a *sui generis* psychological activity, and his conception of the unconscious was fundamentally different than Freud's (see ► [“Judaism and Christianity in Freudian Psychology”](#)). Unlike Freud, who viewed most unconscious contents as the result of repression, Jung conceived of two strata of unconscious processes. The personal unconscious corresponded roughly with Freud's conception. But according to Jung, there was also a deeper transpersonal stratum shared by all human minds that he referred to as the collective unconscious. The collective unconscious was the creative mythopoetic center of the psyche. It included the archetypes comparable to the Platonic “ideas” and like the Kantian *a priori*, served to structure psychological experience.

Jung's Concept of the Self

Jung referred to the “self” (hereafter capitalized) as a supraordinate archetype whose role was to regulate all of the others. He held that the psyche was also a self-regulating structure, with conscious and unconscious processes in an ongoing compensating dialectic. According to Jung, although archetypes were never experienced directly, they were knowable indirectly by the “archetypal images” they mediated. According to Jung, the “self” was also the source of the *imago Dei*, or God image, which could take on many different forms depending on one's personal experience. A major goal of the Jungian individuation process was a progressive conscious experience of the activities of the “archetypes” and in particular the “self,” reflecting Jung's fundamentally religious view of the aim of a life.

Jung had exhibited interest in God as a boy but was unmoved by what he viewed the impersonal approaches of organized religion. He was also disillusioned with his father, a Protestant minister, who, according to Jung, lacked a strong sense of faith and was prone to limpid theological intellectualization. Unlike his father, Jung's approach to religion melded pagan, Eastern, and Christian myths, in the service of providing a transformative personal experience.

Jung's theory of the psychology of religion was influenced by his studies of Eastern religions. In the philosophies of the East, Jung found what he interpreted to be references to the archetype of the “self,” which he modeled on the idea of the *atman* of the Hindu Upanishads. Jung imagined this “self” as a paradoxical symbol, e.g., as the center and circumference of a circle, as personal and impersonal, and as both limited and unbounded. The multicultural symbolic expressions of the “self” could assume many avatars. He further concluded that the implied wholeness of the “self” was depicted by the mandalas of Tibetan Buddhism, and he perceived a link between religion and psychotherapeutic healing, as he had noted that the spontaneous efforts at drawing mandalas were a routine and early feature of recovery from psychosis.

However, Jung was also a pragmatist and concerned that the Western psyche would not be able to embrace Eastern religious myths that called for the progressive extinction of the “ego.” In order to distinguish his psychology from the Eastern nihilistic philosophies, he introduced the idea of “individuation,” i.e., the process via which a person becomes an enlightened psychological individual through a progressive experience of the “archetypes” and in particular of the “self.” He viewed the life of Jesus as the cardinal example of an “individuation” process.

Jung’s idea of the “self” paralleled the Eastern perspective that located God within man, as opposed to the Western disposition of viewing God as a monarch residing somewhere outside of oneself and approachable only by obedience or imitation. Indeed, Jung was criticized by Western theologians for adopting a solipsistic view of God, and some monotheists argued that Jung’s emphasis on the variations of the God image was essentially merely a new form of pagan polytheism.

Jung and Mysticism

The Protestant theologian Rudolph Otto was an important influence on Jung’s psychology of religion. Otto examined the psychology of death and resurrection in *Das Heilig* (The Idea of the Holy). Jung’s idea of an experience of the self parallels Otto’s descriptions of a transformative religious experience and is essentially mystical. This includes the strong affect that Otto referred to as “numinous.” During such a transformative experience, according to Jung, the ego senses the “self” as both imminent and “other,” i.e., as outside the realm of description, irrational, and preverbal. Following Otto, Jung also termed this a *mysterium tremendum et fascinans*, which is invariably characterized by surprise, awe, and fascination. However, both Jung and Otto agreed that the capacity to experience transcendent states was not an equally shared capacity, as certain nonverbal affectual experiences are rooted in prelinguistic activities of the brain that vary among individuals.

Jung viewed the “numinous” experience as the basis of all theophanies and religious revelations. But as Gershom Scholem noted, when “numinous” experiences are reported by those already steeped in a given religious tradition, they generally reflect the images of an underlying orthodoxy, so that Catholics are more likely to be “visited” by the Virgin than by the Prophet Elijah. This observation underscores the importance of societal and cultural influences on religious experience. Jung’s own imaginal confrontations with his unconscious included encounters with Salome, Elijah, Bacchus, and Philemon and appear to reflect his broad knowledge of the syncretistic Hellenistic and Judaic myths that form the basis of Christianity.

Throughout Jung’s explorations of religious myth, and in particular the Christian myth, he stressed the importance of wholeness. He was dissatisfied with the idea of the Christian trinity, because he thought that it excluded the role of the feminine. From his own experience, Jung had come to believe that wholeness was archetypally configured primarily as a “circle” or as quaternities. In his late writings, he noted that the doctrine of the Assumption of the Virgin Mary adopted by the Vatican in the 1950s was actually one of the great theological advances of the Church by raising the level of the feminine principle and acknowledging a quaternity in heaven.

Jung’s emphasis on wholeness helps to explain why he was also opposed to the doctrine of the *privatio boni*, i.e., that evil is merely the absence of God, who according to Augustine is an all good summum bonum. Jung argued that the splitting of good and evil predisposed the Christian psyche to difficulties in metabolizing negative affects, which were instead repressed and embodied by what Jung termed “shadow,” a concept roughly equivalent to the Freudian unconscious.

Myth and Religion

In his explorations of myth, Jung noted what he interpreted to be the struggle of the ego with a greater “other” within the psyche, i.e., a confrontation of the ego and “self.” He repeatedly referred

to Jacob's struggle with the angel as a mythic representation of man's struggle to individuate. For Jung, faith was a cardinal tenet of psychotherapy, as it called for the ego to be transformed by its own "death" and "resurrection." Therapeutic progress was fostered by faith and by an awareness of the "self." This attitude would prompt Jung to suggest to Bill Wilson, the cofounder of Alcoholics Anonymous, that alcoholism could be cured only by faith in a "higher power," an idea that subsequently became a cardinal tenet of 12-step programs.

In *Answer to Job*, Jung examined the asymmetric power struggle between the ego and the "self" and their uneasy, evolving relationship. He argued that in going from the image of Jahweh in the Old Testament to Christ in the New Testament that the God image had actually shown an own evolution of consciousness. This idea was criticized by both Jewish and Christian theologians, who argued that Jung had a persistent tendency to anthropomorphize God, thereby confusing the transcendent creator God with his creation, i.e., man.

Jung and Anti-semitism

A continued area of controversy is Jung's stance with respect to Germanic anti-Semitism during the Nazi era. Jung's psychology included a role for differences between races and cultures, and he has come under substantial criticism in some circles for this view. Although such attitudes were prevalent in Jung's time, it appears that he may have benefited professionally from the systematic persecution of Jewish psychologists in Europe. Jung's activities and public statements during the war appeared to confirm suspicions of Freud's followers that Jung harbored anti-Semitic inclinations. However, Jung's attitudes were by no means consistent and he supported the careers of many of his Jewish colleagues.

Although it is fair to conclude that Jung's primary religious affiliation was Christianity and that he saw it as having had a dominant influence in

shaping the Western civilization, he focused primarily on the mythic elements of the religion, especially on the writings of the third CE gnostics. Late in his career, Jung became preoccupied with the psychological importance of alchemy and investigated medieval texts for evidence of how the alchemical opus was an effort at psychological transformation. His last major work was devoted to the idea of the unification of what he termed "the opposites" that structured the psychological archetypes of what he termed the "collective unconscious." Towards the end of his life, Jung became aware of the enormous influence that the Jewish Kabbalists had on the alchemical tradition. The Hasidic movement of eighteenth CE Judaism had adopted the complex mythical theosophy of the Kabbalists and psychologized it. Their approaches included the concept of *yichudim*, i.e., the unification of psychological opposites in the service of wholeness. Prior to his death, Jung confessed that much of his life's work had been prefigured by early Hasidic masters.

Jungian psychology continues to play an important role in religious movements. Although Jung was more favorably disposed to religion than Freud, his psychology of religion was often at odds with traditional theological perspectives. Some have accused the Jungians of being a guised religious cult, claiming that Jung was attempting to transform the Christianity into a new religious movement. However, such views are likely extreme. Furthermore, most within the Judaeo-Christian tradition continue to view religion primarily as transcendent and beyond psychological interpretation.

One of Jung's important contributions to the psychology of religion was to recognize the primacy of image as the carrier of affect. Jung's psychology of religion emphasizes the importance of embodying experience via encounters with internal imagery, as opposed to the theological abstraction of the Godhead. He recognized that the psyche naturally tended to concretize abstractions into images in order to experience them directly. Otherwise, according to Jung, one risks reducing religion to either ethereal abstractions or ritualistic behaviors. In this regard, like

Freud, Jung appears to have both rejected and attempted to redeem his father.

As a confessed introvert, Jung appears to place primary importance on personal mystical experience. Although he did address the importance of evil in his writings, he views it as an impersonal archetypal force. Jung does not appear to have placed considerable value on the Judaeo-Christian tenets of ethical humanism and *communitas*.

However, Jung's emphasis on the mythic basis of religion continues to provide one of the few secular approaches to the psychology of religion.

The Origins of Academic Psychology

The origins of twentieth-century academic psychology can be traced to E. B. Titchener's school of structuralism or structural psychology, which itself was strongly influenced by the earlier work of Wilhelm Wundt in Leipzig. Wundt was the father of the new experimental psychology (cf. Marx and Hillix 1963, p. 62) and established the first formal laboratory for psychology at the University of Leipzig in 1870, thus succeeding in giving psychology formal academic recognition and delineating it from its two parent fields, physiology and philosophy. Titchener subsequently launched structuralism in 1898 as "the psychology."

The method for Wundt and Titchener was introspection, or the study of one's immediate conscious experience. Consciousness was seen as the sum total of a person's experiences at any given time and mind as the accumulation of these experiences across the life span. Titchener listed three problems for psychology that were similar to Wundt (1894, p. 13): (1) to analyze concrete mental experience into its simplest components, (2) to discover how these elements combine, and (3) to bring them into connection with their physiological conditions.

Titchener brought a number of biases into American academic psychology. First, he felt psychology should study experience detached from learning, that is, detached from attributed emotional meaning. Second, he roughly accepted Wundt's parallelism as a solution to the mind-body problem. This position asserted that the mind and body run parallel courses, without

saying that one causes the other, but simply that both are affected by an external cause. At times, Titchener seems to feel uncomfortable with this mind-body dualism, searching for a more monistic conception, but he never really formalizes this position. Third, he seemed to emphasize conscious introspectionism, rather than attempting to access the unconscious as did Freud. Fourth, Titchener's structuralist approach was very anti-functional in its orientation, a point on which he was attacked by American functionalist and behaviorists. Fifth, Titchener insisted that psychology be pure rather than applied, decrying the notion that the function of psychology was to find ways of ministering to sick minds.

Greek Underpinnings of American Psychology

Jews thus encountered in American academic psychology an approach quite foreign to biblical and later Jewish views of the human being. In fact, some of the thinking in academic psychology seemed to reflect an ancient Greek view of life which Judaism had never been able to accept.

For one, the idea that mind and body are separated rather than integrated seemed to fit the Greek compartmentalization of the human being into *psyche* and soma. In Plato's view, "the soul is a helpless prisoner chained hand and foot in the body, compelled to view reality not directly but only through its prison bars, and wallowing in utter ignorance" (Plato 1993, p. 83a). It is the purpose of the human being to behave in a pure and unblemished manner in order to allow the soul to free itself cleanly from the body and to return to its existence in the ideal world. If the soul does not break away cleanly, it must return to this world until it achieves complete purity (Plato 1993, pp. 61d–68a, 1983, p. 11). Plato's emphasis on philosophy as "preparation for death" is dramatically different from Judaism's life emphasis. *Torah* indeed is described as a "medicine for life" (*Babylonian Talmud*, Kiddushin 30b).

Second, the exclusive emphasis on conscious introspection to the exclusion of the emotional, irrational, and unconscious aspects of the human

psyche reflects the dialectic in the ancient Greek world between the Apollonian and Dionysiac aspects of Greek life (Nietzsche 1956). Unfortunately, the psychoanalytic alternative emphasizing the important role of the unconscious also employed Greek master stories such as Oedipus and Narcissus (cf. Freud 1914, 1923, 1924). Third, the anti-functionalist bias in Titchener reflects an anti-developmental view in Greek mythology and philosophy. Each age of Gods begins anew (Hesiod 1973) with no developmental or historical purpose. Structures become reified as permanent edifices rather than as developmentally purposive. Fourth, the structuralist approach seemed to be too narrow for the Jewish world view to accept, excluding the very issues of free will, morality and wisdom and emphasis on life that Judaism teaches.

Finally, the idea that psychology be pure rather than applied also bespeaks to a certain intellectual prissiness and disdain for the real world. This is quite removed from the Jewish emphasis on action as expressed in the social psychological theory of cognitive dissonance (cf. Festinger 1957) and in certain behavior modification theories in clinical psychology (cf. Ayllon and Azrin 1968; Bandura 1969).

A Judaic View of Psychology

A Judaic view of psychology emanates from *The Torah* which in the fullest sense includes both the Hebrew Bible and the very ancient oral tradition which culminated in the Talmud and Midrash and subsequent rabbinic literature. It has almost nothing in common with the philosophical systems underpinning structuralism and modern academic psychology, largely based on ancient Greek thinking. It has also nothing in common with mythology, which typically centers around fate, caprice, irony, and lack of purpose. A Jewish approach to psychology also differs in emphasis from psychoanalytic thinking which, though founded largely by Jewish figures (Freud, Adler, Rank, Abraham, etc.) and focused on understanding the irrational, relies on ancient Greek master stories as its base. Judaism draws its master stories from the Bible.

1. *The unique and the general.* Genesis relates that God created man in His own image. This emphasizes the value of each individual and tends towards an ipsative psychology rather than to an abstract general idea of mankind. The unique individual must be studied and understood, not an aggregate statistic. A clinical psychology naturally emerges from this viewpoint in which individual differences are valued and respected rather than written off as error variance. The Talmud stresses the value of the individual human being and the irreducibility of each life: "To save one life is to save the world" (*Babylonian Talmud*, Sanhedrin 37a).
2. *Body and soul.* A person's body and soul are holy and are created by God as an expression of love. Body and soul are by nature harmonious and not at all in conflict, and both can work to fulfill a person's purpose of being close to God and serving Him with love. Urbach (1979, p. 214) argues: "In *Genesis* (2:7) it is stated 'and man became a living soul (*nefesh*),' but the term *nefesh* is not to be understood in the sense of psyche, anima. The whole of a man is a living soul. The creation of man constitutes a single act." God created people in His own image and blessed them with creativity and with dominion over all the world. One of the highest acts of human creativity is to produce new human beings, as God Himself did. Every human life is valuable and unique. The human soul need not achieve total perfection in this world nor is the body a prison or a tomb for this soul, but its mansion. It is enough and wonderful for a person simply to do his best.
3. *The self in relationship.* A Jew is obligated to devote himself to studying *Torah* so that he can develop as a human being and use his freedom and creativity optimally. Nor can a person carry this out in isolation from others. This development is expressed in a social context. People were designed to live with others: spouse, family, students, friends, and colleagues. People have obligations to fellow human beings and to God which require constant study and attention. Thus, Judaism tends naturally to an interest in social psychology. However as Hillel taught, obligations to self and other must be balanced (*Avot* 1:14; Kaplan 1998). Furthermore, both outer behavior and inner feeling matter. Cognitive dissonance theory (cf. Festinger 1957) is very Jewish in this regard, emphasizing that the best way to change inner attitudes is to first change behavior. Thus the rabbinic expression, "the hearts are drawn after the actions."
4. *Perfection and wholeness.* While Greek Platonism emphasizes perfection, the Hebrew Bible emphasizes wholeness. For Plato, the *ideal* is always superior to the *real* and *being* to *becoming*. The Hebrew Bible in contrast emphasizes the real and becoming. While Plato viewed philosophy as "preparation for death," the Hebrew Bible, in contrast, constitutes a "guide for living." Thus too, Pygmalion can seek unity only with a woman that he himself forms according to his own specifications. The Bible sees husband and wife as two individual beings, who support each other in searching for fulfillment.
5. *Freedom and obligation.* God has given people freedom to make important moral choices. In order to best use this freedom wisely and to make the best choices, a person must develop both his intellect and emotions. The human being also has a high degree of moral responsibility that naturally complements his freedom. Although God provides a blueprint for the individual to live his life, the individual must discover it and choose to accept it. There is little sense of the determinism or fate so endemic to classical Greek thinking nor any notion that the biblical God is subject to the impersonal forces of fate (*moira*) and necessity (*ananke*) which govern the Greek Gods.
6. *Determinism and repentance.* The *Torah* rejects the idea that human acts are predestined. A person always has a choice to do right or wrong in any situation. There is neither fate nor necessity. A person need not be overwhelmed by feelings of doom, as were the Greek heroes. A single failure need not be seen as archetypal or irremediable. The Greek prophet predicts that an outcome will occur

independent of an individual's actions. The Hebrew prophet, in contrast, typically predicates his prediction on the individual's behavior. The Hebrew prophet hopes that his prophecy will affect the individual's behavior and thus avoid the negative consequences. The individual may repent and thereby alter what happens to him. A person challenged by his own imperfections or handicaps or facing great difficulties can live a loving, happy, and productive life. One need not despair and must always face life with optimism. Hope itself improves both the individual's condition and his outlook. A person can and must improve himself both in spiritual and material matters. Thus, Judaism sees the individual as having great potential for development (cf. Shestov 1966).

7. *Life and death.* Human life is precious and holy. Every moment offers the individual the opportunity to be close to God, to learn, to do good, and to create. The well-known Hebrew toast is "lechayim" – to life! The human being has intrinsic worth as a creation of God, in God's image, and not simply as a function of his achievements. Sometimes, one moment is enough to give new meaning to an entire life. God loves and supports a person in giving him life and capacity and energy to act even when he does evil. Unlike the ancient Greeks and many other civilizations, traditional Jewish thought finds suicide a terrible destruction of human life, perhaps even more abhorrent than murder (cf. Kaplan and Schwartz 1993). While among Greek and Roman philosophers freedom is often equated with suicide (Seneca and Younger 1979, 111.15), the Talmud equates freedom with following *Torah* (*Avot* 6:2).
8. *The unconscious in Judaism.* Judaism is not limited to conscious introspection as was structuralism. Rather, the Talmud, Midrash, and later rabbinic thought place great emphasis on understanding the hidden, unconscious motivations of human behavior. Indeed, Judaism stresses many levels of interpretation of biblical text. The reader is referred to the

important work of David Bakan (1958) on Freud and the Jewish mystical tradition and the more contemporary work of Mordechai Rottenberg differentiating the following levels of interpretation: *peshat* (rational), *remez* (hint), *derash* (inquiry), and *sod* (mystical). In many biblical stories (e.g., Jonah), God actually intervenes as would a good therapist to help a protagonist to learn why he has behaved in a manner harmful to himself and to his higher purposes and to help him to change for the better. Sometimes, learning is aided by the use of parables so that the person is able to look at himself without fear. This is exemplified in the Prophet Nathan's parable to King David regarding his conduct toward Uriah's wife Bathsheba (II Samuel 12). Behavior can affect emotional states, so that some changes at the level of action can bring about changes in one's inner state of mind.

9. *Theory and practice.* Judaism features a long history of concern both for mental health and personal development. This is displayed both in the wide literature on human behavior and growth and also on the strong pattern of close connection between sages and the general community. It was normative for people to consult closely with sages on every sort of personal or familial problems, large and small. No person should feel isolated or abandoned when facing a problem or a hard decision. He has an advisor to turn to in questions of personal development and in practical problems. The rabbis in Eastern Europe operated in many ways like psychotherapists of today. There is a major difference, however. The traditional rabbis employed biblical master stories and Talmudic wisdom as a basis for intervention rather than ancient Greek myths.
10. *Jews, the enlightenment and psychology.* Although the previous sections may suggest to the reader that Jews in modern psychology uniformly carried values and perspectives of biblical and Judaic thought, the reality is much more complex. Many Jews in the field of psychology may actually have been less

traditionally religious than their Christian counterparts – and often times than their own patients. For example, Shafranske and Malony (1990) report that in a sample of 409 clinical psychologists, only 40% believed in a personal transcendent God, compared to 90% of the general public. There are historical reasons for this, arising from the Jewish encounter with the enlightenment which paradoxically offered the individual Jew liberation into a new Europe but at the cost of surrendering something of his covenantal religious and national identity. This same trend existed in American academia in the early and middle parts of the twentieth century. The Jew was seemingly offered emancipation from ethnic and immigrant marginality into the faceless common culture of the secularized enlightenment world of academic psychology (and academia in general) at the expense of a Judaic world view. (This held true despite the quotas on Jews at many major universities, particularly in the northeast United States.) Indeed for many Jews, psychology itself may have become a religion, filled with Greek and Eastern rather than biblical ideas (Wellisch 1954). In recent years, a far more liberated and self-confident Jew has emerged in psychology, joining some Christian counterparts in offering a serious biblical alternative to contemporary psychology (cf. Kaplan and Schwartz 1993, 2006, 2008; Schwartz and Kaplan 2004, 2007; Wellisch 1954; Yerushalmi 1991). This has resulted in a plethora of books and interdisciplinary journals such as *The Journal of Psychology and Judaism*, *The Journal of Psychology and Christianity*, and *The Journal of Psychology and Religion*.

Judas Iscariot

Clodagh Weldon
Dominican University, River Forest,
IL, USA

Introduction

In Christianity, Judas Iscariot is one of the 12 apostles who betrayed Jesus for 30 pieces of silver. His name, Judas (*Ioudas*), is the Greek form of Judah, the southern territory of Palestine (renamed Judea by the Romans). The inhabitants of Judah were the Judahites (later abbreviated as “Jews”), and thus Judas’ name is equated with the Jews. The name “Iscariot” is subjected to two different interpretations. The first is that it means “Man of Kerioth,” a city in Judah (Joshua 15:25), which would be significant because it would present Judas as an outsider, a man who was different from the 11 Galileans. A second suggestion is that “Iscariot” derives from the Greek “sicarri,” a sect of the Zealots who took up arms (daggers) against the Romans. Whichever interpretation is preferred, Judas’ name is synonymous with betrayal; to call someone a “Judas” is to express contempt for the duplicitous behavior of that person.

Judas in the Bible

In the Old Testament, Judah was the son of Jacob and Leah. His name in Hebrew, *Jehudah*, means “praise the Lord.” Judah was a patriarch of one of the 12 tribes of Israel. This is significant because Jesus’ call of the 12 apostles symbolizes a reconstitution of the 12 tribes. Judas, son of Simon the Iscariot (Jn 6:71), is chosen by Jesus as one of the 12 apostles and is always listed last (Mt 10:4, Mk 3:19, Lk 6:16, Jn 6:71). He is presented in the gospels as thief (Jn 12:4) and betrayer.

Although best known for his betrayal of Jesus, another story about Judas appears in the Gospel of John. In it, Judas protests the anointing of Jesus at Bethany by Mary as a wasteful act, suggesting that the oil should have been sold and given to the poor. His concern, however, is not for the poor but, as John tells us, “because he was a thief and held the money bag and used to steal the contributions” (Jn 12:7).

Judas’ task as betrayer is brought to light at the Last Supper, when Jesus predicts that someone with whom he shares this meal (and the table fellowship which accompanies it) will betray him (Jn 6:64, 13:11, 26), thereby fulfilling the prophecy of Ps. 41:9. Jesus’ followers want to know the identity of the betrayer (Mt 26:21), and Jesus reveals that it is the one who dips his bread with him into the dish (Mk 14:18). He warns that it is better not to be born than to betray the Son of Man. Symbolically, the dipping is an image of death.

Both Luke and John see Judas’ betrayal as the work of Satan (Lk 22:3, Jn 13:2): in Luke, Satan enters into him; John says he is “a devil.” Judas goes to the chief priests to see what they will give him to hand Jesus over (Mk 14:10), and he betrays Jesus for 30 pieces of silver (Mk 14:10; Mt 27:10), by all accounts a paltry amount. Matthew tells us that this is a fulfillment of the prophet Jeremiah; in fact it is a fulfillment of Zechariah 11:12–13. Arriving in Gethsemane with a large crowd with clubs and swords (Mt 26:47), Judas gave the chief priests a sign – the famous and duplicitous kiss – in order that they might arrest Jesus.

According to the author of Matthew’s gospel, Judas regrets what he has done (Mt 27:3) and

returns the 30 pieces of silver (Mt 27:4), throwing it into the Temple. Luke, however, tells a different story: Judas used the 30 pieces of silver to buy land (Acts 1:18). Matthew and Luke also give different accounts of Judas' end. For Matthew, the cause of death is suicide by hanging (Mt 27:5), but for Luke it is a fall. He writes, "falling headlong, [Judas] burst open in the middle and his insides spilled out" (Acts 1:19). Henceforth, the field was known as "Akeldama, i.e., Field of Blood" (Acts 1:20). Some scholars have tried to reconcile the two accounts, suggesting such things as a suicide gone wrong.

The question of Judas' fate has long been a subject of theological debate. For some, he is eternally damned, condemned, for example, to the lowest circle of Dante's *Inferno*. Placed head-first into one of the three mouths of Lucifer (Brutus and Cassius, who also killed their masters, are devoured in the other two mouths), Judas Iscariot is chewed for all eternity as his back is skinned by Lucifer's claws. Not all, however, share Dante's vision of Judas' fate; for some, his eternal damnation is more problematic because it conflicts with God's goodness, and for others, it raises questions about the fairness of his fate given its place in the divine plan as foretold in Old Testament prophecy (Zech. 11:12–13, Ps. 41:0).

Some scholars (e.g., Klassen) dispute the traditional rendering of Judas as betrayer, based on the translation of the Greek word *paradidomi*. The word is used 59 times in the New Testament: when used in connection to Jesus (27 times), it is translated "handed over" (this is related to the word *paradosis* which is used of the tradition which is "handed down" from the apostles); when used in connection with Judas (32 times), however, the word is translated as "betray." If this reading is correct, the centuries-old maligning of Judas is brought into question.

The Gospel of Judas

The Gospel of Judas, discovered in Egypt in the mid-1970s and recently unveiled by National Geographic, also presents a very different picture of Judas. In his *Adversus Haereses* (*Against*

Heresies), which is dated c. CE 180, St. Irenaeus, Bishop of Lyon, condemns this gospel as "a fabricated work." He identifies it as a Gnostic text because it presents secret knowledge (*gnosis*) as the way to salvation. The Gnostics were dualists – they saw the material world as evil and the spiritual realm, the realm of God and the aeons (or divine principles) which emanate from God, as good. The material world is created as a result of the fall of one of these aeons, and some of the divine substance becomes trapped in human beings. Human beings, however, are unaware of this, and so Christ is sent to reveal this secret knowledge to his inner circle and thereby save them. In *Against Heresies*, St. Irenaeus tells us that Judas was the only one among the 12 who "recognized the truth and perfected the mystery of betrayal." In other words, Judas alone possessed this secret knowledge. Indeed scholars tell us that the recently unveiled manuscript of the Gospel of Judas begins with the words "The secret account of the revelation that Jesus spoke in conversation with Judas Iscariot" and has Jesus saying to Judas, "Step away from the others and I shall tell you the mysteries of the kingdom." Unlike the canonical gospels, the Gospel of Judas sees Judas as a hero, the greatest of the apostles. Jesus tells Judas, "You will exceed all of them. For you will sacrifice the man that clothes me." In other words, Judas' betrayal helps Jesus to get rid of his material body and thereby liberates the divine substance that was trapped within, facilitating a return to the spiritual realm. From a historical perspective, the Gospel of Judas does not reveal much about the historical Judas, but it does give more insight into Gnosticism from a Gnostic perspective.

Judas and Anti-semitism

Given the association of Judas' name with the Jews (the Judahites – later abbreviated to Jews – were the inhabitants of Judah, which is Judas' name in Greek) and the gospel identification of Judas with the demonic, the anti-Semitic charge of the Jews as "Christ killers" can be seen going back to Judas. Medieval artwork often exaggerates the Jewish features of Judas, despite the fact that Jesus

and his followers were all Jewish. Some scholars even doubt the historicity of the person of Judas, suggesting that he functions as a literary device to blame the Jews for the death of Jesus.

Commentary

For Freud, betrayal is oedipal and thus rooted in jealousy. He saw his split with Jung as an oedipal betrayal of the father. In “Two Lies Told by Children” (Freud 1976, pp. 305–309), Freud makes an explicit reference to Judas’ betrayal as oedipal in nature. He tells the story of a 3-year-old girl who was given hush money after seeing her nursemaid having sex with a doctor. The girl played with her newly acquired coins in such a way as to betray the maid to her mother. This, says Freud, she did out of jealousy. Some years later, when she was 7 years old, the girl requested money from her father to purchase paints that she might use to decorate her Easter eggs. Much to her dismay, the father denied her request. Given her earlier association of taking money with erotic relations, Freud argues that the young girl felt this as a deep rejection by her father. Sometime later, the girl needed 50 pfennigs to make a contribution for a funeral wreath of a princess who had died. Her father gave her ten marks with which the little girl contributed to the wreath collection. Having bought the paints she had long desired with another 50 pfennigs, the girl placed the remaining nine marks on her father’s table. Denying that she had purchased the paints, her brother betrayed her and she was severely punished. Consequently, the little girl felt the father’s punishment as a rejection and suffered from psychological problems, especially in relation to money. One day, just before starting school, a neighbor sent her on an errand with some money. Meeting the neighbor on the way home, the little girl threw the change down on the pavement. Pondering her actions, she thought them “inexplicable,” “the thought of Judas occurred to her, who had thrown down 30 pieces of silver which he had been given for betraying the master.” But in what way could this young girl identify with Judas? He argues that her early

traumatic experience of erotic relations, in which she had betrayed her nursemaid for money, had led her to associate taking money from anyone as a symbol of a physical surrender (“an erotic reaction”) and taking money from the father as “a declaration of love.” He concludes that the little girl’s desire for her father is denied because it is unconscious – she cannot admit it to herself in the same way that she cannot admit that she appropriated the money (Freud 1976, p. 309).

For Jung, on the other hand, Judas’ betrayal of Jesus is archetypal, i.e., it is a universal motif which taps into a tremendous force of the collective unconscious (Jung, § 42). As a myth, it is particularly tragic because the hero is destroyed by a friend through treachery (Jung, § 42). Examples abound in Shakespeare (Othello, Lady Macbeth, King Lear, Julius Caesar), in the Bible (Delilah and Samson, Jacob and Esau, Joseph and his brothers), and in Greek mythology (Clytemnestra and Agamemnon, Odysseus and Philoctetes, Medea and Jason). For Jung, the betrayal myth will continue to be repeated because it articulates the idea that envy “does not let mankind sleep in peace” (Jung, § 42).

Julian of Norwich

Jill L. McNish

Union Theological Seminary, Swedesboro, NJ,
USA

Background

Julian of Norwich, sometimes referred to as “Dame Julian,” “Julian,” or “Mother Julian,” was an English mystic who lived at the end of the fourteenth and beginning of the fifteenth centuries. The circumstances of her early life are shrouded in mystery, but it is believed that in or about 1373, she suffered a very serious illness from which she miraculously recovered. It has been conjectured that she may have been married and had children prior to becoming a mystic and anchoress. Visions that she experienced in the course of her illness, many of which involved Jesus’ Passion, radically changed her life and led her to become an anchoress enclosed in a single-room cell attached to the church of St. Julian in Norwich. There were two windows in her cell. One was a small window onto the street, from which Julian could converse and provide spiritual direction (which she did for many individuals including, most famously, Margery Kempe); the other window permitted her to witness masses in the adjoining church. Julian is best known for two accounts of the visions she had while ill and theological conclusions that she eventually drew as she contemplated and integrated the meaning of those visions. The first and much briefer account, written soon after her illness, is sometimes known as the *Short Version of the Revelations of Divine*

Love, sometimes alternately known as *Showings of Divine Love*. The second account, an expansion of the first version, was written about 20 years later.

Psychological and Theological Perspectives

It is not known whether Julian actually penned the accounts herself or dictated them to a scribe. In any event, her work is extremely significant in and of itself for being what is believed to be the earliest surviving work in the English language reflecting the feelings, thoughts, and experiences of a woman. Beyond that, or perhaps partly because of that, the work is of great significance for the following theological/psychological orientations:

1. Julian emphasized and developed an idea that had emerged only tangentially in earlier Christian writings (including places in the Hebrew scriptures, St. Paul’s epistles, and in some medieval writing), i.e., the idea of God and Jesus as having the attributes of “Mother” as well as “Father.” Thus, she wrote, “So Jesus Christ, who opposes good to evil, is our true Mother. . . . As truly as God is our Father, so truly is God our Mother, and he revealed that in everything, and especially in these sweet words where he says: I am he; that is to say: I am he, the power and goodness of fatherhood; I am he, the wisdom and lovingness of motherhood; I am he, the light and the grace which is all blessed love. . . .” (Julian 1978, pp. 295–296). Julian continued in this vein in equating a mother’s milk with the blood of Jesus: “The mother can lay her child tenderly to her breast, but our tender Mother Jesus can lead us easily into his blessed breast through his sweet open side, and show us there a part of the godhead and the joys of heaven. . . . This fair lovely word ‘mother’ is so sweet and so kind in itself that it cannot be said of anyone or two anyone except of him and to him who is the true Mother of life and of all things” (Julian 1978, p. 299). In her work, Julian

perhaps more than any other mystic of the Middle Ages incorporated the feminine into the Godhead.

2. Julian's work is notable in its time and context for its theology of sin which is remarkably grace filled and displays a vision of God which is at once bigger than that of most of her contemporaries and more personal. For Julian, God was not a stern, rageful, judgmental Father, but a wise, loving, and compassionate Father and Mother who understands our nature and expects us to sin. Thus, in one of her visions, she heard Jesus say, "Sin is necessary but all will be well, and all will be well, and every kind of thing will be well" (Julian 1978, p. 225). Moreover, she said that in her visions, "I did not see sin, for I believe that it has no kind of substance, no share in being, nor can it be recognized except by the pain caused by it" (Julian 1978, p. 225). Julian wrote that we were not to "be too much aggrieved by the sin that comes. . . against God's will" (Julian 1978, p. 33). Perhaps most surprisingly for a person who lived in the Middle Ages, Julian said that she saw "no kind of wrath in God. . . ." (Julian 1978, p. 33).
3. Writing in a historical time and place of much barbarism, upheaval, and premature death owing to many factors including the Black Death, Julian's work is notable and unusual for its lightness and for its sense of optimism and divine love that it conveys. In her work, one experiences an overarching sense of an overflowing grace and goodness and kindness in the Godhead and in Divine Providence. Thus, her *Revelations* contain the constant refrain and insistence that regardless of what may befall us, and as impossible as our life situations may sometimes seem, we will "not be overcome" (Julian 1978, p. 164) and that "all will be well." Julian concludes her *Revelations* with the following words she perceived from God:

What, do you want to know your Lord's meaning in this thing? Know it well, love was his meaning. Who reveals it to you? Love. What did he reveal to you? Love. Why does he reveal it to you? For love. Remain in this, and you will know more of the same. But you will never know different, without end (Julian 1978, p. 342).

Taken as a whole, Julian's *Revelations* reveal a person who appeared to be remarkably devoid of defenses of shame, dualism, splitting, self-hatred, paranoia, and negative introjections that were the hallmarks of many of the other mystics and theologians of her time; a person who furthermore was able to integrate archetypes of the maternal, the paternal, and the lover into her images of God in Jesus Christ.

Jung, Carl Gustav

Murray Stein

International School for Analytical Psychology,
Zurich, Switzerland

Carl Gustav Jung (1875–1961), the founder of Analytical Psychology, ranks as one of the major contributors to the modern psychological understanding of religion and religious experience. His signature work in this area, presented in 1936 in the annual Terry Lectures at Yale University, is *Psychology and Religion*.

Childhood

Carl Jung was born into a traditional and unusually religious Swiss family. His father, Johann Paul Achilles Jung, was a Swiss Reformed pastor with a doctorate in Oriental languages from

Göttingen University, and his mother, Emilie née Preiswerk, was the daughter of a prominent Swiss Reformed minister in Basel, Samuel Preiswerk. Jung's early years were deeply infused with religious influences and impressions. Surrounded by church and churchmen in his childhood and growing up in ultraconservative Basel, he assimilated the prevailing religious atmosphere of Swiss Protestantism of the place and times, with its characteristic narrowly provincial views of Catholics, Jews, and other cultural aliens. In time, he would rectify this narrowness.

In the autobiographical work, *Memories, Dreams, Reflections*, Jung reports a number of childhood experiences involving religion and religious figures. As an intellectually restless adolescent, he questioned his father sharply about the teachings of Christianity, such as the doctrine of the Trinity, but found no satisfaction in his father's answers. Subsequently, he turned to books in his father's library for enlightenment. When his mother gave him a copy of Goethe's *Faust* and passed on to him the family myth that his grandfather Jung – also named Carl Gustav, a professor of medicine and ultimately the *Rektor* of the University of Basel – was an illegitimate descendent of Goethe's, he became fascinated by this classic of German culture for life. In the gymnasium and later while attending medical school at the University of Basel, he read philosophy (Kant, Schopenhauer, C.G. Carus, and Nietzsche were especially important) in his spare time. All of this would feed eventually into his extensive studies of myth, religion, and heterodox traditions such as Gnosticism and alchemy. In his adult years, his erudition in the history of world religions and their symbolisms was formidable.

Early Contributions

While enrolled as a resident psychiatrist at the Bärgholzi Klinik in Zurich, where he was the chief assistant to Prof. Eugen Bleuler, he began an intense collaborative relationship with the Viennese founder of psychoanalysis, Sigmund Freud. He would later call this his first big indiscretion because Freud had no standing whatsoever

in psychiatry or university circles at the time. Jung recognized Freud's genius immediately upon meeting him and was initially impressed by the scientific and therapeutic value of his methods for delving into the dark corners of the human mind. The voluminous correspondence between the two men contains a graphic account of the waxing and waning of their relationship and reveals the importance that their differing attitudes toward religion played in their discussions. From the beginning, however, Jung was skeptical about Freud's heavy reliance on the sex drive and on personal psychodynamics to explain the etiology of neurosis and psychosis on the one hand and more importantly about his insistence that repression, sublimation, and wish fulfillment could exhaustively explain the creation and meaning of human culture and religion. Later, in the person and philosophy of William James, whom he met at Clark University in Worcester, MA, in 1909, Jung found a more intellectually compatible resonance. He especially appreciated James's empirical methodology in *The Varieties of Religious Experience*.

When the relationship with Freud broke up in 1913, Jung had just completed *Wandlungen und Symbole der Libido*, translated as *Psychology of the Unconscious* in 1916 and later revised and published as *Symbols of Transformation*. This was his first extensive exploration into the primordial and collective foundations of dreams, fantasies, and imagination. In 1914, having separated from Freud and resigned from the International Psychoanalytic Association, of which he was president, Jung founded his own school of psychoanalysis, Analytical Psychology. In 1921, he presented the results of his new thinking in the volume, *Psychological Types*. In these two early works, he delved deeply into the history of Western thought, including its theological and religious traditions. In addition, his broad study of world religions, mythologies, and other symbol systems is also on full display there. At the same time, he was engaged in a challenging self analysis, which is described in *Memories, Dreams, Reflections* and which he discussed with students in a number of seminars (as recorded, for instance, in *Analytical Psychology: Notes of the Seminar Given in 1925*). Jung was fully cognizant of the

religious content of his dreams, fantasies, interpretations, and written creations (such as the quasi-Gnostic *Septem Sermones ad Mortuos*) during this period. Relying heavily on these “inner experiences,” many of which are recorded in *The Red Book* (a privately kept journal that is due to be published for the first time in 2009), he constructed the psychological basis for his approach to religious life and spirituality, which would appear in many writings in the decades to follow. As a modern person who had left, or had “fallen out of,” his inherited religious tradition and was therefore without a myth to live by, Jung felt a strong need to make up for this loss. Without myth, he discovered, the individual’s life lacks meaning. Many of his subsequent essays are addressed to people like himself. In his depth psychology, Jung offered a set of methods and interpretive strategies that could be used to solve this crucial spiritual problem at the core of modernity.

Collaboration and Influences

Increasingly, Jung’s interpretations of religion departed from the typical contemporary psychoanalytic ones. Jung did not intend to be an apologist for religion, as Freud was quick to claim. While appreciative of the value of religious traditions and aware of the power of religious images and experiences to transform individuals’ lives, Jung could also be skeptical and certainly knew of the shadow sides of these institutions and psychic phenomena. Rather than wrapping himself in assertions of faith, his intent was to use his psychological theory as a scientific hypothesis that could perhaps explain the origins and significance of religious thought, imagination, and feeling and the religious behavior of human beings throughout history and across cultures. After World War I, Jung made trips to such far-flung places as the American Southwest, Africa, and India, where he observed the religious customs and mythologies of the indigenous peoples. These journeys fed into his interest in the varieties of religious ideas, perspectives, and images that grow out of the psychic

experience as well as further convinced him of their common features and patterns.

In the 1920s, through his acquaintance with Hermann Graf Keyserling and participation in the latter’s “School of Wisdom” in Darmstadt, Germany, Jung met Richard Wilhelm, the missionary Sinologist and translator into German of a host of texts from the Chinese including, importantly, the *Tao Te Ching* and the I Ching. Through friendships such as these, he developed a special and abiding interest in Eastern thought and religions, and he began as well to find intriguing parallels between Western psychology and Eastern philosophy, which added credibility to his intuition that the collective unconscious is the universal matrix of religious imagery and ideation. In 1928, Wilhelm invited Jung to write a psychological commentary for his translation of the Chinese text, “The Secret of the Golden Flower,” which gave Jung the opportunity to inspect more deeply and precisely the commonalities between the psychological processes he found active in his European and American patients and the more explicitly spiritual productions of the ancient Chinese practitioners of yoga and alchemy. These parallels fascinated him and led him to formulate the view that the unconscious is the source of a spontaneous evolution of religious imagery with a concomitant suggestion of transcendent meaning, which can eventually make its way into consciousness via dreams and imagination. In a series of lectures given in the 1930s and later formulated in more detailed terms as Part II of the work, *Psychology and Alchemy*, Jung attempted to demonstrate how this process can be observed in a modern nonreligious Western person’s dreams and spontaneous fantasies. In these studies, he identified a process of spiritual development that emerges from the unconscious background of the psyche into the light of day through the medium of dreams and active imagination. A hallmark of this development is the experience of the numinous archetypal images of the collective unconscious. (Rudolph Otto’s book, *Das Heilige* (in English, *The Idea of the Holy*), played an important role in Jung’s thinking about psychology and religion. Otto coined the term

“numinosum” to describe the nature of religious experience.)

In the 1930s, Jung collaborated with a number of well-known scholars of Eastern Religions, such as Heinrich Zimmer, Wilhelm Hauer, D.T. Suzuki, and W.Y. Evans-Wentz. For Evans-Wentz, who was translating and editing a series of Eastern texts into English, Jung wrote psychological commentaries on *The Tibetan Book of the Great Liberation* and *The Tibetan Book of the Dead*. His interest in the psychological aspects of world religions was further expanded and greatly nourished by his participation in the Eranos Tagungen held in Ascona, Switzerland, annually beginning in 1933. In this international gathering of scholars, he met and conversed with such luminaries as Martin Buber (on Hasidic Judaism), Henri Corbin (on Islamic mysticism), Mircea Eliade (the founder of the discipline known as History of Religions), Karl Kerényi (on Greek mythology), Gilles Quispel (on ancient Gnosticism), Paul Radin (on Native American mythology), Gershom Scholem (on Jewish mysticism), and Paul Tillich (on Protestant theology). In turn, Jung's ideas had a significant influence on the thinking of the scholars who attended the Eranos conferences.

Religion and Archetype

Jung's psychological theorizing puts forward the notion that all human beings share a common primordial level of psyche, which he termed the collective unconscious. Out of this common psychic matrix, he argued, are forged all the world's religious images and dogmas. The characteristic patterns of Deity, which take form spontaneously throughout history and across geographical regions, he designated as archetypal images. These fundamental patterns can be found in all peoples and are particularly obvious in their myths and rituals. The religious dogmas and icons of the world's religions give expression to refine and elaborate, in one degree or another, the archetypes of the collective unconscious. This makes of them suitable containers for the

complexity of individual human psyches. As containers, the dogmatic expressions within religions also provide a strong defensive bulwark against the onslaught of original religious experiences of the numinous, which Jung (as a cautious psychiatrist) feared could lie at the root of ominous psychiatric disturbances if they occurred to insufficiently stabile personalities. They could also bring about collective states of possession and lead to social upheaval and catastrophe, as he witnessed in nearby Germany during the 1930s and 1940s.

The archetypes underlying and supporting the religious dogmas and images are psychological forces: they behave like drives, but they are not just impulses, they are also represented as images in the psyche and can express themselves as ideas and ideologies. They have both a spiritual and a biological basis. Jung regarded the production of images and ideas with a strongly religious thrust to be a natural human tendency. In his view, the proclivity to imagine and conceive, to worship, and to recognize Divinity belongs to the human psyche's nature, and the psyche's more unconsciously created and driven religious productions are often combined with the more conscious human need for personal meaning. With this perspective, Analytical Psychology is able to take a view of religious experience and behavior in all its manifestations that is appreciative of psychological values, including both defensive and prospective ones.

Jung and Christian Tradition

After a trip to India in 1938, Jung focused more exclusively on his own background religious tradition, Christianity, interpreting and commenting on its images, doctrines, rituals, and texts in such works as: “Transformation Symbolism in the Mass” (1941/1954), “A Psychological Approach to the Dogma of the Trinity” (1942/1948), *Aion* (1951), and *Answer to Job* (1952). In these writings, Jung used psychological theory to interpret critically the psychological sources, consequences, and implications of the Christian

tradition – its Biblical background, its theological and ethical thinking, and its two millennia of history. His use of a variety of heterodox and hermetic materials – Gnosticism and alchemy, especially – should be attributed not only to a personal preference for these esoteric movements nor only to his opinion that the practitioners of these were more psychologically minded than the mainstream theologians but importantly also to their value as resources for attaining a critical distance from the orthodox and dogmatic religious tradition. He found in these counter movements a means for purchasing insight into Christianity's one-sidedness and inadequacies due to the repression of differing but complementary religious tendencies. Jung claimed to respect all religions, their symbolisms and ritual activities, since all equally originated from a common human matrix, the collective unconscious and the archetypal patterns of the psyche. But he also allowed himself to retain a critical perspective on all of them equally from the vantage point of psychology.

During the final decades of his life, Jung carried on a rigorous epistolary dialog with the English Dominican theologian, Fr. Victor White, O.P. (1902–1960). More than any other of Jung's theologically informed and trained students, Fr. White consolidated and expanded on Jung's dialog with the Christian tradition, especially as it is expressed in the Roman Catholic Church. In his two books, *God and the Unconscious* and *Soul and Psyche*, White explored in a highly refined and disciplined fashion the potential for dialog between Analytical Psychology and Roman Catholic theology. The collaboration between these two men broke down because of their insurmountable differences – Jung was a secular Protestant who followed Kant's epistemological reservations about metaphysics, White was a Roman Catholic priest and a committed Thomistic theologian; Jung viewed God as a symbol, White had faith in a revealed God; and Jung understood God as a coincidence of opposites (*coincidentia oppositorum*, following Nicholas of Cusa among others) and held out for the psychological reality of evil as a potent force in human affairs as opposed to the way he saw Christianity playing it down in its teaching

of evil as “privation of good” (*privatio boni*), White accepted the Catholic teaching of God as the Highest Good (*Summum Bonum*) and considered evil, even if it is real enough in human affairs, to be but without metaphysical foundation. Their differences in methodology and ways of thinking – psychological versus theological – remain highly instructive for anyone wishing to enter into the dialog between depth psychology and traditional theology.

Jung, Carl Gustav and the Psychology of Religion

Peggy Kay
Minneapolis, MN, USA
Division 36, Psychology of Religion and Spirituality, American Psychological Association, Washington, DC, USA
Division 32, Humanistic and Existential Psychology, Transpersonal Psychology Special Interest Group, American Psychological Association, Washington, DC, USA

Carl Jung is widely regarded both within and outside of the psychological community as the

preeminent and pioneer psychologist in the psychology of religion, as a psychologist who examines spiritual and religious contents of the psyche. He has asserted his theory of individuation as the psychological and experiential framework for spiritual transformation, as the psychological life cycle of spiritual individuation, transformation, and maturation. Jung shows psychologically how people transform spiritually. Healing, for Jung, is psychological wholeness, and in his theory of individuation, he examines the spiritual aspect of psychological wholeness.

Jung's theory of the individuation process of spiritual transformation is systematic and phenomenological and occurs across the entire life cycle. Jung – psychiatrist and psychologist – was theoretically systematic and scrutinized experience in light of theory and theory in light of experience. He looked for psychological processes of transformation, whatever the contents being processed, and he fit experience and contents into his psychological theory. Throughout his career, however, he returned to spiritual and theological contents on an ongoing basis. The depth and volume of work devoted to psychological analysis of spiritual contents over the course of his career makes him the premier psychologist with which to psychologically approach the problem of understanding spiritual process.

As a physician, a psychiatrist, a psychoanalyst, and a psychotherapist, Jung had extensive and rigorous academic training and professional experience in medicine as a physical science and in psychology as a human science. In his work as a psychologist, particularly his notion of individuation, Jung's life's work was preoccupied with the contents and function of the conscious and the unconscious, of the ego and the Self. In his exploration of these contents, he encountered and dealt with religion, theology, spirituality, and god images as symbols. Jung observed spiritual and religious phenomena in the individual and in himself. His psychotherapeutic practice and personal spiritual experiences informed his theories, which in turn informed his practice.

Religion surrounded Jung, in his father's career and in having eight uncles who were parsons. We see in Jung developmental

trajectories: his relationship to religion, his own inner spirituality, and his academic, scientific, medical, and psychological training and practice. Jung's thoughts on religion developed greatly over the course of his career, from the Freudian view that the father image is a precursor of the god image, to Jung's idea of God as a projection of psychic energy, to Jung viewing "the idea of God and the whole complex world of religious phenomena not only as projections of psychic processes but also as indispensable symbols that express and draw human beings toward psychic wholeness" (Wulff 1997 p. 435). In Jung's work we see the preeminent psychological view of spiritual contents of the psyche, individual phenomenology, and spiritual transformation across the life cycle.

The facts prove, says Jung. . .that the psyche possesses a religious function. The psychologist's task lies in helping people to recover the inner vision that depends on establishing a connection between the psyche and the sacred images. Rather than attacking or undermining religion, psychology "provides possible approaches to a better understanding of these things, it opens people's eyes to the real meaning of dogmas, and, far from destroying, it throws open an empty house to new inhabitants". Psychology, unbounded by creed, can help the undeveloped mind to appreciate the value and scope of the paradoxes of faith. . .to come near a comprehension of the totality of life (Wulff 1997 p. 437 paraphrases and cites Jung CW Vol. 12 Par. 17).

Methodologically, then, Jung approaches the great mysteries with which religion and spirituality are concerned as being at the core of human existence psychically and experientially. Therefore, it is that with which psychology must be fundamentally concerned. He sees these factors as being at the root of the human psyche, so it is that with which the self is most concerned and involved. He psychologically reframes human experience within the context of religious experience, going so far as to say that the human Self is revealed in the religious function of the psyche and that the religious function is inextricably linked to the manifestation of the Self. Jung's psychological methodology is to view and treat the human psyche and Self as being rooted in religious experience.

So convinced was Jung of the importance of the spiritual contents of the psyche that it was in fact Jung's view of the spirit and its importance which caused his break with Freud (Wulff 1997 p. 420) in 1909–1913. Jung dedicated his life and career to understanding the psychology of human spirituality. To Jung, the spirit is inextricable from being human and from consciousness. Consciousness is a crucial, integral notion here. Psychological dynamics explain its contents and functionality. Jung gives us a tour of the interior through his process of individuation. Edinger (1972 p. xiii) defines Jungian individuation as "...a process in which the ego becomes increasingly aware of its origin from and dependence upon the archetypal psyche." Jung's theory of individuation focuses on the psychic processes of spiritual transformation, so it is the theory of individuation from Jung's corpus that receives prime consideration in this article.

The ancestry of our Carl Gustav Jung, who was born in Switzerland in 1875 and died in 1961, is traced from Carl Jung, died 1694, who was a "learned Catholic doctor and Jurist. . .[and] lived at a time when pharmacology was still heavily influenced by alchemy." C. G. Jung, our Jung's paternal grandfather, was a professor of surgery at the University of Basel in 1822. Carl's father, Paul Jung, was "a student of philology and linguistics, in which he had earned a PhD". Subsequently he gave up his philological studies and took up theology instead for financial reasons. As a pastor he was respected and loved, but "he became increasingly subject to despair, according to his son, as he realized the hollowness of his own religious faith." Jung's father was reliable, but Jung did not feel close to him as he did to his "uncanny" mother, who he had experienced as unreliable. Jung was very influenced by nature and by his intense dreams (Wulff 1997 p. 416–8).

Religious symbols appeared in his dreams to profound affect. Uninterested in doctrine, Jung greatly anticipated his first communion, which he regarded as "the pinnacle of religious initiation." When he finally experienced it, nothing extraordinary happened, and he felt that God had been absent. "I had prepared for it in all earnestness, had hoped for an experience of grace and

illumination, and nothing had happened. God had been absent. For God's sake I now found myself cut off from the Church and from my father's and everybody else's faith. . . My 'religion' recognized no human relationship to God, for how could anyone relate to something so little known as God? I must know more about God in order to establish a relationship to him" (Jung 1961 pp. 56–7). He continued throughout his life to reconcile his personal psyche and faith and religious life, while making meticulous empirical and philosophical observations and theories of both individual and collective human psyches. The development of Jung's relationship to religion and of his own inner spirituality continued throughout his life.

In practice at the Burgholzli, the prestigious psychiatric hospital and clinic of the University of Zurich (see Fig. 1), Jung "wished to understand

Jung, Carl Gustav and the Psychology of Religion, Fig. 1 The young Carl Gustav Jung in front of Burgholzli, Zurich, 1910 (Photo on file, Library of Congress, <http://www.loc.gov/pictures/item/98514811>: public domain, https://en.wikisource.org/wiki/Author:Carl_Gustav_Jung#/media/File:Jung_1910-rotated.jpg)

the disturbed personality, but was equally puzzled by the attitudes of his colleagues, which seemed to him strange and reductionistic. He did not share their apparent conviction that delusions and hallucinations are devoid of human meaning or that the individuality of the patient may be ignored." After 4 years there, he resigned as senior physician because of his "burgeoning private practice" (Wulff 1997 pp. 419–20). His interest in science fueled his education and career, and his quest to understand human meaning propelled his practice. Thus, his writings contain academic scientific approach and systematic analysis, as well as empirical data and experiential findings and influenced theoreticians.

Jung's adherence to scientific methodology never hindered his simultaneous insistence on understanding human phenomenology and inner meaning. Jung today often is called a mystic and has just as often in the past been called a philosopher, but in his *Psychology and Religion* he says of himself that he is a scientist, an empiricist, and a phenomenologist. He felt it did not conflict with scientific observation and classification of experience to also reflect on experience and its assimilation, all of which he believed to be integral to understanding a phenomenon. His approach was from a scientific and not a philosophical standpoint, with concentration on empirical facts.

The methodological standpoint of that kind of psychology which I represent...is exclusively phenomenological, that is, it is concerned with occurrences, events, experiences, in a word, with facts. Its truth is a fact and not a judgment...Psychological existence is subjective in so far as an idea occurs in only one individual. But it is objective in so far as it is established by a society – by a consensus gentium. . .

This point of view is the same as that of natural science. Psychology deals with ideas and other mental contents as zoology for instance deals with different species of animals. An elephant is true because it exists ...[It] is neither a conclusion nor a statement nor a subjective judgment of a creator. It is a phenomenon. But we are so used to the idea that psychical events are willful and arbitrary products, even inventions of the human creator, that we can hardly liberate ourselves from the prejudiced view that the psyche and its contents are nothing but our own arbitrary invention or the more or less illusory product of assumption and judgment. The fact is that certain ideas exist almost everywhere and at all

Jung, Carl Gustav and the Psychology of Religion, Fig. 2 Carl Gustav Jung (Photo from <https://carljungdepthpsychology.wordpress.com>)

times and they can even spontaneously create themselves quite apart from migration and tradition. They are not made by the individual, but they rather happen – they often force themselves upon the individual’s consciousness. This is not platonic philosophy but empirical psychology (Jung 1938 p. 1–4).

Jung observed the psychological aspects of religion and viewed religion through psychological empiricism. He deliberately restricted himself to observation of phenomena. Although he did not deny the validity of mystical, metaphysical, or philosophical aspects of religion and the experience of it, his sole approach to religion was phenomenological and empirical and observational.

Jung’s thoughts on religion developed greatly over the course of his career, from the Freudian view that the father image is a precursor of the god image, to the idea of God as a projection of psychic energy, to viewing “the idea of God and the whole complex world of religious phenomena not only as projections of psychic processes but also as indispensable symbols that express and draw human beings toward psychic wholeness” (Wulff 1997 p. 435). This evolutionary development of religion for Jung was both an “inner quest and outer achievement... The intimate relation of the *life* and work of an individual is perhaps nowhere more clearly illustrated than in the instance of Jung and his psychology. The matured Jung

(see Fig. 2.) said of himself that his work was a vital and inseparable expression of his own inner development, that each of his writings constitutes a station along his life’s way” (Wulff 1997 pp. 421–3).

Jung emphasized, in his approach to religion and in his response to his critics, that as a psychologist he could know no more of God than of what God is in the psyche. “Psychology as the science of the soul has to confine itself to its subject and guard against overstepping its proper boundaries by metaphysical assertions or other professions of faith” (Jung CW Vol. 12 par. 15). In his practice and in his own experience, Jung saw that psychology entails, observes, and tries to understand the religious function of the psyche. He discusses the task of the psychologist in relation to the pastoral task of clergy in his article “Psychotherapists or the Clergy” which is the final chapter in his book *Modern Man in Search of a Soul* (1933). Clergy teaching religious doctrine do not take into account psychic processes, nor do medical doctors whose task is in the physical realm.

Jung’s position is that the psychotherapist can guide spiritual transformation through knowledge of the dynamics and processes of the psyche, providing understanding of the nonphysical processes lacked by doctors and of the process by which religious teaching of clergy can become

lived experience rather than just acquired knowledge. The task of the clergy, for Jung, is religion. The task of the doctor is the body, and the task of the psychotherapist is the psyche. “By his care for the psyche of his patients Jung tries to understand the meaning of philosophical, religious, and metaphysical statements and their relation to life, in order to apply them in his psychotherapy,” says Jung’s colleague and namesake” (A. Jung, cited in Jacobi 1973 p. 55).

Jacobi describes Jung’s position on god images and God as immanent in man and sets them in the context of individuation.

The transcendent God will remain the object primarily of theology and faith, but his operation in the depths of the psyche, as the ‘immanent God’, is also the concern of scientific psychology, since he can make himself known directly through the symbols of the Self. People do not listen to their inner voice, however; only a few are able to believe that something divine is contained in their soul (Jacobi 1965 pp. 52-3).

Here Jacobi also shows how Jung’s psychology approaches God as operating “in the depths of the psyche” as immanent and how the person can begin to access “their inner voice” by coming to know that “something divine is contained in their soul.”

Jung, Carl Gustav, and Alchemy

Alane Sauder-MacGuire
New York, NY, USA

The practice of the alchemical arts has its origin in the second or third century BCE in Greece. It spread through the ancient Near and Far East. In the most basic understanding, alchemy has always been about transformation and remains so in the psychological theory of Carl Jung. The name, alchemy, in fact, derives from the Arabic *al-kimia* meaning the art of transformation.

Transformation in alchemy is effected by the realization of oppositions and the subsequent reconciliation of those opposites. The work involved

discerning oppositions and then reconciling what often seem irreconcilable opposites. The goal was to produce a unity and wholeness that was then incorruptible and was able to transcend oppositions. This remained for the alchemist and so remains today for the psychotherapist using an alchemical model in his practice: an ideal never attained, but aspired to. In fact, the attainment of the goal would put an end to the growth as well as the needs for growth of the personality because it is from that tension of opposites that the personality develops.

Perhaps in the popular imagination, alchemy is most commonly thought to be about the converting of base metal into gold, a nonreactive or incorruptible metal. Symbolically, the alchemical processes naturally metamorphose into the transforming of the corruptible into the non-corruptible and of physical matter with its corruptibility into something beyond corruption – that is eternal. A concurrent purpose of the transformation of base metal into gold became creating an elixir of life that could ameliorate the process of corruption of the body in the aging process. It was by the creation of what is termed the philosopher's stone that these processes could be accomplished. In Jungian psychology, this is thought of as the third that emerges from the irreconcilable opposition of the two and is termed the transcendent function that will be discussed below.

Originally, the processes of psychic transformation and physical transformation were amalgamated in the alchemical arts. The moral and religious problems that alchemy implicitly addresses were intertwined with the idea of the physical transformation of the metals.

In the Renaissance, alchemy developed in two directions – one moving closer to science and the other becoming more philosophical. The former focused on the transformation of physical stuff and eventually became the discipline of chemistry. The latter remained more of an art becoming more philosophical and concerning itself with the imaginal and the transcendent. The problem for these alchemists, in part, became the reconciliation of the experience of physicality with its temporal and limited orient with the soul, spirit, and imagination with their limitless eternity.

In either case, Jung believed the idea of the transforming of metal into gold captured the passion and thereby the imagination of an alchemist. They described in their writings the archetypal process of transformation of the personality into an integrated form in which its integrity was corrupted neither by inner nor outer events. Jung called this process individuation, and although unattainable, it was always an inner quest.

As such, Jung believed the writings of alchemists provided a window into process of the unconscious. He felt it described the psychological phenomenology observed in the unconscious often with a detail he found astonishing. The alchemists either projected their psychological content unto the base metal or, in later times, later used the metals as a vehicle to describe their inner strivings. Because they knew little or nothing about the actual properties of the metal, it provided a blank screen for their projections and descriptions.

Jung held that in understanding the projections the alchemist made unto the metal, the clinician could gain insight into the natural and archetypal processes of the unconscious and thereby bring into consciousness elements and developments within the psyche that would promote the process of individuation. In its complexity, alchemy mirrored the complexity of the human psyche.

Jung also felt that the alchemical writings provided a needed compensation to Christian doctrine. Although the majority of the alchemists whose writings Jung explored were Christian, their writings included chthonic elements that Jung felt were missing from the Christian cannon, but an integral part of psychological reality. Most importantly for Jung, alchemical writings incorporated the bodily experience and the idea of evil not just as a perversion of creation and existence but as an element of it.

For Jung as for the alchemist, the problem of the opposites was of prime importance, and good and evil as the components of morality are among the most psychologically important opposites. To Jung, the Christian doctrine of original sin did not adequately address the problem of evil, but instead split evil off from good and from god in creation. Evil as sin was only a perversion of this good. Jung believed that in order for the

individual psyche to individuate, evil must be considered seriously as an archetypal force as innate and fundamental both to creation and the individual self. Because evil was so split from the idea of god in Christian doctrine, the collective consciousness, conditioned by that Christian doctrine, was forced to identify with the good or be burdened by a guilt that prohibited the realization of the wholeness of the personality.

The dominant worldview was that the patriarchal world with its masculine orientation of consciousness which precluded the acceptance of evil. The alchemist projected elements of the matriarchal feminine unto the metals and so thereby incorporated in their writings that which had been culturally repressed. Inclusion of the matriarchal feminine allowed for the reconciliation of good and evil and made it possible in a psychological way that Christian doctrine did not provide.

Richard Wilhelm, the noted sinologist, propelled Jung into study of alchemy through his interpretation of a Chinese treatise, *The Secret of the Golden Flower*. Jung's first alchemical writing published in 1929 was the introduction to Wilhelm's translation of this work.

In 1944, Jung's *Psychology and Alchemy* (CW 12) was published. It contains a dream series that showed the process of individuation that Jung amplified and interpreted using alchemical symbolism. It also contains an essay explicating the religious elements of alchemy. Other of Jung's alchemical essays are in *Alchemical Studies* (CW 13).

What is generally thought to be Jung's greatest alchemical work and the culmination of his research and thinking about alchemy, *Mysterium Coniunctionis* (CW 14), was written between 1941 and 1954. It is concerned predominantly with the problem of opposites and uses a variety of symbolic alchemical symbols such as Sol and Luna, Rex and Regina, and Salt and Sulfur to explicate the problem. "Coniunctio" was the alchemical word for the unification of opposites and Jung felt that this unification of opposites was the central problem of alchemy.

The metaphor of the sexual unity of male and female is often used to illuminate the process because it is the most obvious opposition in the human experience. It was Jung's contention,

certainly supported in the alchemical literature, that every human has within his unconscious a contra-sexual part or archetype that he termed as anima in man and animus in woman. The symbol of sexual unity, thus, provides the image of the human being reconciling the opposites within.

Perhaps the most explicit use of the sexual metaphor used by Jung to describe psychic phenomena is in *The Psychology of the Transference* (part of CW 16). It was originally a part of *Mysterium Coniunctionis*, but was published separately in 1946 and analyzes a series of sixteenth-century alchemical woodcuts called the *Rosarium philosophorum*. It is Jung's major work on transference/countertransference dynamics. Jung understood the images portrayed in the woodcuts to describe the complexities he had experienced in the transference/countertransference field in a way that no other vehicle could.

Commentary

In understanding Jung's work in interpreting alchemical writings and their relation to psychological material, it is important to understand that for Jung, projection was not only as in the Freudian sense a mechanism for evacuating discordant repressed material. It was also a mechanism for the realization of the eternal components of the personality that have never been conscious. Jung termed these components archetypal. They represent the innate patterning of psychological process and behavior that constitute the experience of being human. The projections, the alchemist made upon the metals, represented archetypal material that described the process of individuation.

On the one hand, Jung meant individuation as the process of the spiritual components of the personality joining together with the instinctual components into a wholeness. On the other hand, individuation can be thought of as the process of fully living out the fullness one's potential – being the very being one was meant to be. Obviously both of these processes entail a unity of the personality that reconciles the opposing components that are inevitable results of the expanding consciousness resulting from confronting the unconscious.

The process of individuation has a complexity, subtlety, and a myriad of variations. In alchemical symbolism, Jung found a way to describe it.

The analogy to the alchemist attempting to make gold which is a metal whose components are stable and nonreactive is obvious. The attempt was to find a substance that could contain the warring oppositions that caused the metal's instability. In his psychological theory, Jung has termed this holding together the tension of these opposites a mediating third the transcendental function. For a third way that holds these opposing tendencies together to emerge, one must work to the extent of one's ego's ability on the problem and wait for the solution from the depth of the psyche.

The following is an attempt to describe the individuation process in a linear form that must necessarily be only a surface view of a profound process:

The process begins when the original unity of being begins to break down with the confrontation of what Jung has termed shadow. The shadow is the part of the personality that is repressed because it does not meet with the ideal of what one or society believes one should be. As the individual becomes aware that these shadow qualities lie within and can no longer be blamed on mother, father, or someone else, the original unity is shattered and the work of reconciling ego and shadow begins.

There is also the confrontation of the archetypal pieces that vie for the time-limited space of consciousness – such as feeling the desire to be a mother while at the same time desiring a powerful work position. One desire is motivated by what Jung would call the mother archetype, the other by the power principle. Both may be aspects of the self that need to be expressed, but the limitation of time may not allow both to be expressed with a full intensity.

Another example of oppositions called forth in the process of individuation would be falling in love with someone and being in a situation where the sacrifice of much that is loved in one's present life would be necessary if the new love is to be realized. The ego can find no solution with the attitude it holds except to split from one love and cling to the other. The answer can only emerge from the confrontation and struggle with the

unconscious. It is this sort of psychological struggle the alchemical process describes.

Jung did not believe that the problems of life engendered by these conflicting components were soluble as such, but rather that a new attitude must emerge that could hold them. Alchemically, this was the philosopher's stone that allowed seemingly opposing forces to exist in harmony. Psychologically, this means the ego moves more in accord with the self. In other words, the temporal world of the ego is reconciled with the limitless self-moving which moves consciousness to a viewpoint large enough to encompass the conflicts. The individuated way would be holding the tension of these opposites until a third way (the transcendent function) emerges.

In summary, alchemy provided for Jung insight into the process of individuation. It allows the student of his methods a map of complexity and subtlety to the unfathomable depths of the psyche.

Canterbury, Kent, UK

Jung's Celebration of Eastern Religious Traditions

C. G. Jung's dialog with Eastern religious traditions, spanning almost 50 years, was profoundly

influential on the development of analytical psychology, enabling him not only to discover cross-cultural confirmation for his clinical research but also to extend his own metapsychological concepts (Jung 1973, 1976; Coward 1985, 1996; Bishop 1992; Clarke 1994; Shamdasani 1996). Based on the assumption that Western consciousness is historically conditioned, is geographically confined, and represents only part of mankind, he argued that Eastern psychology forms the indispensable basis for a critique and objective consideration of Western psychology (Jung 1931/1962, 1950/1955, 1973). Jung's primary interest was in *yoga*, a general term for him indicating the spiritual development of the personality within the Hindu, Buddhist, and Taoist religious traditions. Rather than distinguishing between the variety of yoga practices and competing soteriological perspectives established by the canonical traditions of Hinduism, Buddhism, and Taoism, Jung was interested in yoga as a natural process of introversion, seeing the inner processes to which yoga gave rise as universal and the indigenous methods employed to achieve them as culturally specific (Jung 1936; Shamdasani 1996). The symbolism of oriental yoga materials provided Jung with invaluable comparative material for the interpretation of the collective unconscious, assisting him in his endeavor to develop a cross-cultural comparative psychology of inner experience (Coward 1985; Clarke 1994; Shamdasani 1996). Thus the intention of his essays and commentaries on Indian, Tibetan, Chinese, and Japanese religious materials (Jung 1931/1962, 1932, 1935/1953, 1936, 1938–1939, 1939a, b, c, d, 1943, 1944a, 1950a, b), as well as his persistent reference to these materials throughout his other mature writings (Jung 1921, 1934–1939, 1951, 1955–1956, 1963, 1973, 1976), was not to invite his readers to uncritically adopt Hindu, Buddhist, or Taoist spiritual practices, but to demonstrate that the contemporary intrusion of Eastern spirituality into Western consciousness (which has a long history) possesses profound psychological significance: the Western discovery or rediscovery of the collective unconscious, the source of religious experience. Moreover, his research on Eastern religious traditions led him to realize that European alchemy, providing a bridge between

analytical psychology and Gnosticism, is a Western form of yoga (Jung 1938–1939; Coward 1985; Clarke 1994; Gomez 1995; Shamdasani 1996).

Jung was drawn toward Eastern mystical traditions because of their dominant orientation toward overcoming severe imbalances between opposites (particularly spirit and matter/instinct and good and evil) causing disunity within the psyche and human suffering. This healing tendency of *yoga* traditions to focus their attention on the dynamic interplay between complementary opposites and psychic liberation from them through either their balancing or transcendence, Jung argued, paralleled, even anticipated, his own individuation process of seeking psychic wholeness. Recognizing Chinese and Indian symbols of the *Tao*, *brahman*, *atman*, and many others as uniting pairs of opposites provided him with confirmation that the archetype of the “self” unifies all opposites (Jung 1921, 1931/1962, 1939c, 1955–1956, 1963; Coward 1985, 1996; Clarke 1994). Moreover, Jung was attracted to the emphasis Eastern yoga traditions place on detachment from egocentricity as the condition for the spiritual transformation of consciousness, because it provided support for his affirmation that individuation requires the shifting of the center of the personality away from the ego (and its emotional attachments to the outer world) and toward the self. For Jung, recognizing that the ego stands to the self as the moved to the mover, or as object to subject, leads to an extension and refinement of consciousness familiar to the East, enabling the analysand to achieve relief from suffering caused by the conflict of opposites and to realize that it is not that something new is seen but that one sees or experiences differently (Jung 1931/1962, 1934–1939, 1939b, c, 1941/1954, 1951, 1963, 1973, 1976; Coward 1985; Clarke 1994). What impressed Jung most about the transformation of consciousness celebrated by the yoga traditions of the East (equated by him with the self-liberation of the mind in contrast to the grace of God in Christianity) was the importance assigned to bringing the divinity within the range of human experience rather than, as in much Western religion, accepting that God is inaccessible to human consciousness (Jung 1939c, 1963; Coward 1985).

Jung's Ambivalence Toward Eastern Religious Traditions

Nevertheless, Jung's enthusiasm for Eastern religious traditions was qualified by what he considered to be their excessively introverted psychological orientation. Observing that the mind of the Far East is related to our Western consciousness as the unconscious is, that is, as the left hand to the right, he understood the relationship between Eastern and Western mentalities and religious traditions to be one of complementary opposites. Whereas Western man is predominantly extraverted, finding meaning in the external world, Eastern man is predominantly introverted, locating the meaning within himself through sinking into meditation. Adopting a position of East/West psychological relativism, he argued that whereas the introverted Eastern spiritual perspective searches for the riches of knowledge within the psyche, the extraverted Christian perspective is driven by the principle of love which encourages worldly activity. Whereas for the Westerner, the essence of that which works is the world of appearance, for the Indian it is the soul because he recognizes that the psyche alone possesses immediate reality. The world for him is a mere show or façade, and his reality comes close to what we in the West would call a dream. Jung's encounter with what he perceived to be the dream-like world of India during his visit to the subcontinent in 1938 led him to conclude that whereas the Westerner believes in *doing*, the Indian believes in impassive *being* because God is within all things and especially man (Jung 1921, 1932, 1939a, c, d, 1943, 1947/1954, 1950/1955, 1955–1956, 1963; Coward 1985; Reynolds 1989; Clarke 1994; Gomez 1995).

Jung, however, was equally critical of the psychological perspectives of both the introverted East and the extraverted West. Both standpoints, he argued, while each having their psychological justification, are one sided or extreme in underrating or losing one half of the universe (either the world of consciousness or of the unconscious); thereby, they make the mistake of artificially separating themselves from total reality.

Both the Eastern and the Western standpoints need to reorient themselves toward the goal of the individuation process: the conjunction of introversion and extraversion. Since the twentieth century, Western man is excessively extraverted, suffering an unprecedented spiritual crisis because he has no time for self-knowledge and he is in need of compensatory introverted spirituality to provide necessary psychic balance. Here, for Jung, lies the meaning of the West's engagement with the East during the twentieth century; exposure to Eastern traditions provides the catalyst for Western spiritual transformation: the realization that the unconscious is the generator of consciousness. The West must, however, approach Eastern values from within and not from without, building on its own psychic ground with its own methods to produce a Western form of yoga on the basis laid down by Christianity, rather than trying to cover its spiritual nakedness with the gorgeous, but psychologically alien, trappings of the East. Jung argues that an encounter with yoga in the twentieth century serves to remind us that we in the West possess similar forms of introverted spirituality: Gnosticism, medieval Christian mysticism, and alchemy (Jung 1930, 1938–1939, 1939c, 1943, 1944a, 1951, 1954, 1955–1956, 1963; Coward 1985; Clarke 1994; Gomez 1995).

Jung insisted that the mentalities of the East and the West are fundamentally different, because they are the products of different histories deeply rooted in the psyche. Because Eastern religious teachings, symbols, and practices are a foreign body in the Western psyche, adoption of them in the West can only succeed in producing an artificial stultification of Western intelligence and the means not of addressing Western psychological and spiritual problems, but of avoiding them. For this reason, Jung repeatedly warned against the practice of yoga by Europeans, a form of mimetic madness which could, on the one hand, lead to a strengthening of will and further repression of unconscious contents by consciousness and, on the other hand, to psychotic states in which consciousness is overwhelmed by the unconscious. Instead of the practice of yoga, Jung prescribed for

the European his own visionary technique of active imagination to facilitate the flow of unconscious contents into consciousness (Jung 1916/1958, 1931/1962, 1932, 1935/1953, 1936, 1938–1939, 1939c, 1943, 1944b, 1951, 1954, 1963; Coward 1985; Clarke 1994; Shamdasani 1996).

Jung's Objections to Hindu and Buddhist Nondualism

Moreover, Jung objected to the claim of nondualist Hindu and Buddhist traditions that the ego can be *completely* dissolved in, or absorbed by, the transcendental self (*brahman*, *atman*, *purusa*, *nirvana*) in a trance-like state (*samadhi*) attained by yoga practice. He argued that the identification of the self-conscious subject with, or its disappearance within, a universal consciousness celebrated by Eastern canonical traditions must be equated with unconsciousness and that exclusion, selection, and discrimination are the root and essence of consciousness. Jung conceded that the practice of yoga can produce a remarkable extension of consciousness, but it cannot lead to an egoless state, because there must always be something or somebody left over – the infinitesimal ego, the knowing “I” – to experience the realization that there is no distinction between subject and object. If there is no knowing subject, the nondual position cannot be stated as an object of knowledge (Jung 1939c, e, 1951; Coward 1985; Reynolds 1989; Clarke 1994). In contrast with this nondualist position celebrating the transcendence of opposites (*nirdvandva*), ultimate perfection, and the final conquest of suffering attained through the realization of *moksa* (liberation) or *nirvana* (enlightenment, extinction), for Jung, because the infinite unconscious can never be fully known by the finite ego and the individuation process never completed, suffering caused by the dynamic interplay of opposites can never be fully overcome. Jung insists that complete redemption from suffering in this world is an illusion and complete liberation from the opposites means death (Jung 1916/1958, 1946, 1958,

1963, 1973; Ajaya 1983; Coward 1985; Clarke 1994; Muramoto 2002).

Jung's Dialog with Taoism

Jung's exposure to Taoist materials was more influential on the development of his concept of the self than his dialog with the Hindu and Buddhist nondualist traditions. Noting that the *Tao* is the middle way between opposites such as man and nature and heaven and earth, he recognized that the goal of Taoist practice of reestablishing a balance between the opposites of *yang* (warmth, light, maleness, heaven) and *yin* (cold, darkness, femaleness, earth) in the *Tao* and the goal of the individuation process, a balancing of compensating psychic opposites in the experience of the self, were parallel processes. Jung found in the Taoist teaching that man, as microcosm, is a reconciler of opposite confirmation, on the one hand, for his view that individuation requires bringing the opposites of spirit and instinct and introversion and extraversion into harmony through letting go of the ego in spontaneous action (*wu-wei* – action through non-action) and, on the other, for his theory of synchronicity, the meaningful acausal connections or correlative parallels between inner psychic and outer physical events. Jung's dialog with Taoism led him to affirm through his theory of synchronicity that intrapsychic life must be interrelated with corresponding experience of the external world (Jung 1921, 1931/1962, 1950a, b, 1951, 1952, 1963; Aziz 1990; Clarke 1994; Coward 1996; Main 2004).

Jung, Carl Gustav, and Feminism

Vivianne Crowley

Cherry Hill Seminary, Columbia, SC, USA

Department of Psychology, Nottingham Trent University, Nottingham, UK

Carl Gustav Jung’s analytical psychology was important in valuing the feminine in counterbalance to what he saw as an excessive shift towards “masculine” logos, rationality, and science in Western society. But, infused with patriarchal assumptions, Jung’s work on gender is flawed and lacks awareness of the issues raised by later feminist psychologists such as Crawford and Unger (2000). Jung’s work is however an important catalyst. Jung’s critique of religion has inspired some women and men to challenge the absence of the divine feminine and women leaders in their religions of birth and others to turn to goddess spirituality to find empowering religious images and roles.

Women in Switzerland

Carl Jung’s attitudes to women were formed in the conservative patriarchal culture of late nineteenth-century Switzerland. It was an era that saw the beginning of first-wave feminism; but women did not gain the vote in Swiss federal elections until 1971 (CFQF 2009b), and equality in education was not written into the Swiss constitution until 1981 (CFQF 2009a).

Women’s Role

The Swiss women’s movement was divided between those seeking equal rights and political representation and “dualists.” Dualists predominated and pursued an “equal but different” agenda that saw women’s role as primarily to

assure the well-being of the family (CFQF 2009c). Jung supported the idea of women's suffrage (Adler 1975, pp. 475–478), but his theories reflected a “dualist” viewpoint that stereotyped women.

The conscious attitude of a woman is in general far more exclusively personal than that of man. Her world is made up of fathers and mothers, brothers and sisters, husbands and children. . . . the man's world is the nation, the state, business concerns, etc. (Jung 1953/1979, Vol. 7, para. 338).

Jung saw *Eros* (feeling, relatedness, and love) and *logos* (reason, spirit, and differentiation) as present in both sexes but women as oriented primarily towards *Eros* (Jung 1953/1979, Vol. 9ii, para. 28). He spoke disparagingly of women who tried to make the sexes equal, rather than valuing difference. Attempting to follow a “masculine” profession might injure women's “feminine nature”; for while women could “do anything for the love of a man,” only the exceptional could do something important for the “love of a thing” (Jung 1953/1979, Vol. 10, para. 243).

Anima: The Female Within the Male

Douglas points out that Jung's work synthesizes the positivism of his medical studies with romantic philosophy that endowed women with the unconsciousness, irrationality, depth, and emotions forbidden to the “masculine” rational self (Douglas 1997, p. 19). Jung considered the unconscious a source of knowledge and insight, and through his relationship with a woman, a man could access his inner feminine, the *anima*, which is

. . . fundamentally unconscious . . . an imprint or ‘archetype’ of all the ancestral experiences of the female, a deposit, as it were, of all the impressions ever made by woman . . . (Jung 1953/1979, Vol. 17, para. 338)

Jung comments that “Every mother and every beloved is forced to become the carrier and embodiment of this omnipresent and ageless image . . .” (Jung 1953/1979, Vol. 9ii, para. 24). Jung's thinking often appears to confuse women's psychology with the male projection of the *anima*.

Women Analysts and Jungian Psychology

Feminist theologian Mary Daly has commented that few women analysts trained by Jung questioned his ideas on gender, and she criticizes women for promoting “Jung's garbled gospel” as feminist (Daly 1978, p. 280). David Tacey believes that there was even a “secret payoff” for women in identifying with Jung's *Eros* model:

. . . Jung was inviting them to step outside their limited humanness and to become archetypal. Women were secretly to view themselves as living incarnations of the Goddess . . . (Tacey 1997, p. 28)

Jungian psychology had in any event more practical attractions. The profession of analyst had much to offer in an era when it was difficult for educated women to make a career. Whatever Jung's gender biases were, he saw women as excellent potential therapists and was willing to train them.

Many of those who trained were far from Jung's *Eros*-dominated stereotype. Dr. M. Esther Harding was a strong-minded lesbian whose books were important for the development of goddess spirituality. Together with Drs. Eleanor Bertine and Kristine Mann, she founded the powerful New York C. G. Jung Institute. Dr. Jolande Jacobi drew up the original plan for the C. G. Jung Institute in Zurich. Dr. Marie-Louise von Franz was Jung's valued collaborator on his alchemical works.

A careful reading of women analysts' work reveals a more proactive engagement with Jung's ideas than Daly depicts. Jung was aware of his limitations:

The elementary fact that a person always thinks that another's psychology is identical with his own effectively prevents a correct understanding of feminine psychology. (Jung 1953/1979, Vol. 10, para. 240)

It was women analysts who developed Jungian thinking on women. Toni Wolff argued that *Eros* is not the leading mode of conscious functioning of all women and that Judaism and Christianity, with their lack of the divine feminine, damage women. Drawing on sources including Bachofen

on prehistoric matriarchy, Wolff created a typology that categorized women as mother, *hetaira* (in ancient Greece, an educated female courtesan), medial woman, or Amazon. Earlier generations might be limited to only one of the archetypal roles; but contemporary women should aim to move beyond this “one-sidedness” (Wolff 1941). Jung considered that the *anima* in men was mirrored in women by the *animus*, but his ideas were vague (Jung 1953/1979, Vol. 9ii, para. 28). It was Emma Jung who developed the idea that as women matured psychologically, so too would their *animus* figures and that rather than projecting these qualities onto a man, women must reclaim what the *animus* symbolizes – word, power, meaning, and deed (Jung 1957, p. 20).

Religion and the Feminine

From a feminist perspective, patriarchal religions can be a source of oppression for women. Jung raised radical questions about the God image of Christianity, which he considered deficient psychologically because the Trinity did not include a female aspect (Jung 1953/1979, Vol. 11, para. 251). When in 1950 Pope Pius XII proclaimed the Catholic dogma of the Assumption of the Blessed Virgin Mary into Heaven, Jung saw this as an important event that left Protestantism as

... nothing but a *man's religion* ... Protestantism has obviously not given sufficient attention to the signs of the times which point to the equality of women. But this equality requires to be metaphysically anchored in the figure of a ‘divine’ woman ... The feminine, like the masculine, demands an equally personal representation. (Jung 1953/1979, Vol. 11, para. 753)

The impact of Jung’s psychology can be seen in the work of goddess-oriented women, such as Adler (1986), Crowley (1989), and Starhawk. Indeed, Adler comments that

Much of the theoretical basis for a modern defense of polytheism comes from Jungian psychologists, who have long argued that the gods and goddesses of myth, legend, and fairy tale represent archetypes, real potencies and potentialities deep within the psyche, which, when allowed to flower, permit us to be more fully human. (Adler 1986, p. 28)

From a Christian perspective, analyst Ulanov accepts the idea of female identification with *Eros* but views *Eros* as of equal value to logos and criticizes the exclusion of feminine imagery from religious symbolism as psychologically and socially damaging.

Goddess as Role Model

Other Jungians found in ancient goddesses models for women’s psychological growth that go beyond Jung’s stereotyped thinking. Esther Harding sees in myths of a virgin Moon Goddess, who is virgin in the sense of being “one-in-her-self” yet also goddess of love and mother goddess, an archetypal pattern helpful for modern women.

In the same way the woman who is virgin, one-in-her-self, does what she does – not because of any desire to please, not to be liked, or to be approved, even by herself; not because of desire to gain power over another, to catch his interest or love, but because what she does is true (Harding 1971b, p. 125).

Turning to ancient myth, Sylvia Brinton Perera interprets the voluntarily descent of the Sumerian goddess Inanna into the underworld as a heroic quest and an empowering approach for women in overcoming depression. Jean Shinoda Bolen in *Goddesses in Everywoman* and Jennifer and Roger Woolger in *The Goddess Within* find in goddesses such as Artemis, Athena, and Hera powerful female archetypes that can help women negotiate the complexities of contemporary life. A goddess is seen not a supernatural being but

... a complex female character type that we intuitively recognize both in ourselves and in the women around us. (Woolger and Woolger 1990, pp. 7–8)

Such psychological reductionism may offend the religious who worship ancient deities but points to how powerful deity symbols can help overcome sexual stereotyping.

Feminist Critique

Until the mid-1970s, Jung’s work was widely seen as valuing the feminine. This changed with

second-wave feminism, which sprang from the realization by women that

... male-authored systems of knowledge ... had either omitted or distorted the representation of women. (Rowland 2000, p. 73)

Naomi Goldenberg accused Jungian psychology of being itself a form of patriarchal religion, in which Jungians failed to question the “prophet’s” premises about archetypes and women. Demaris S. Wehr (1988) evaluates Jungian ideas of “the feminine” as essentialist, conservative, contradictory to feminism (p. 10), and distorted by androcentrism and misogyny (p. 99). She acknowledges, however, Jung’s contribution in highlighting the negative effects for women of masculine deity symbols which

... lead people to feel comfortable with or to accept social and political arrangements that correspond to the symbol system. (Wehr 1988, p. 22)

Postmodernism and third-wave feminism, in which

... the very dichotomy man/woman as an opposition between two rival entities may be understood as belonging to metaphysics (Kristeva 1979/1986, p. 209),

has seen a reinterpretation of Jung’s concepts. Estella Lauter, a pioneer of feminist archetypal theory, argues that the *animus* is not reflected in women’s artwork and may not be numinous for women, as is the *anima* for men (Lauter 1985, p. 72). James Hillman considers that *anima* cannot be “contained by the notion of contrasexuality” and is relevant to women and men (Hillman 1985, pp. 53–55). Tacey comments that Hillman’s work has value in removing,

... the patriarchal assumptions and conservative biases of Jung’s psychology, adopting his androgynous understanding of the psyche without his moral imperatives ... (Tacey 1997, p. 31)

Susan Rowland argues that, from a postmodern feminist perspective, Jungian archetypal theory may overcome the influence of patriarchy because, not being culturally derived, the unconscious should “compensate for and combat cultural stereotyping” (Rowland 2000, p. 42).

Contemporary thinking that sexual orientation falls along a continuum rather than being an absolute has drawn upon Jung’s ideas that

Either sex is inhabited by the opposite sex up to a point. ... (Jung 1953/1979, Vol. 9i, para. 58)

and

As civilization develops, the bisexual primordial being turns into a symbol of the unity of personality, a symbol of the self, where the opposites find peace. (Jung 1953/1979, Vol. 9i, para. 294)

Analyst Susan McKenzie argues that Jung’s psychology can be read as supportive to postmodern queer theory and that contemporary Jungians should

... engage in a revision of Jungian gender theory ... to offer a Jungian contribution to gender thinking in the spirit of the other Jung: the Jung of the symbolic, the mythic, and the subtle body.

Despite its flaws, Jung’s work inspired many pioneering women in the field of psychotherapy, and it continues to be a fruitful resource for new generations of feminist women and men seeking to address some of the fundamental questions of the psychological meaning of religion for individuals and society.

Jung, Carl Gustav, and Gnosticism

Leon Schlamm

School of European Culture and Languages,
Religious Studies Section, University of Kent,
Canterbury, Kent, UK

In response to persistent charges by his theological critics that he was a Gnostic (Buber 1952; Heisig 1979; Segal 1992; Dourley 1994), Jung insisted that he was neither a Gnostic nor a metaphysician, neither a theist nor an atheist, neither a mystic nor a materialist, but rather an *agnostic* empirical scientist and an analytical psychologist (Jung 1951–1961, 1952/1973, 1956–1957, 1963). Yet Jung's enthusiastic engagement with Gnosticism spanned more than four decades, from his early association with G. R. S. Mead and his frequent citation of his translations of Gnostic and Hermetic writings (Goodrick-Clarke and Goodrick-Clarke 2005; Hoeller 1988; Noll 1994) and his 1916 paranormally produced gnostic poem, *Septem Sermones ad Mortuos* attributed

to Basilides of Alexandria (Jung 1916/1992), to his systematic treatment of Gnostic materials transmitted by Patristic sources in *Aion* in 1951 and the acquisition by the Bollingen Foundation, through the efforts of Gilles Quispel, of the Jung Codex (containing the *Evangelium Veritatis*, the “Gospel of Truth”) in 1953 (Jung 1953; Rudolph 1987; Wehr 1987).

Reasons for Jung’s Interest in Gnosticism

Jung’s interest in Gnosticism arose as early as 1909, through his discovery that they were apparently the first thinkers to concern themselves with the numinous contents of the collective unconscious (Jung 1952/1973). Recognizing Gnosis as a psychological knowledge whose contents derive from the unconscious, Jung argued that the Gnostics anticipated and more or less prefigured the goal of analytical psychology, the individuation process, albeit expressed in a language suited to the age they lived in, thereby demonstrating that the idea of the unconscious was not unknown to them (1951a, b). This discovery that the Gnostics were, in their own way, engaging with unconscious contents was the first to end what Jung saw as his intellectual isolation, providing confirmation from the history of religions for the veracity of his own psychological findings (Jung 1921, 1951a, b). Such confirmation and support for his work would later be supplemented by his research into European alchemy which provided a bridge from the modern world to ancient Gnosticism (1963). Acknowledging that alchemy was a continuation of Gnosticism, Jung affirmed that psychology could not be divorced from history.

Yet Jung always qualified his enthusiasm for Gnosticism, claiming that the Gnostics had no genuinely psychological conception of archetypal images. Rather, they projected their subjective inner perception into a cosmogonic system and believed in the metaphysical reality of its psychological figures (Jung 1921, 1963). In other words, ancient Gnostics had not achieved individuation in the modern sense; but because they engaged with unconscious contents more intensely than

most of Jung’s contemporaries, their symbols and experiences provided illuminating comparative material which, through amplification, could deepen Jung’s clinical understanding of the unconscious. Jung’s preoccupation with the parallels between Gnostic and modern clinical materials should be construed, therefore, not as evidence that he was a Gnostic – although he made no secret of his preference for religious experience over faith or belief (Jung 1906–1950; McGuire and Hull 1977) – but rather as a vehicle for carrying his own modern psychological research into the individuation process forward.

Jung’s Interpretation of Gnostic Materials

Jung provides a summary of his reading of Gnosticism in *Aion*. The Gnostic myth of the ignorant *demiurge*, who imagined he was the highest divinity, illustrates the perplexity of the ego when it can no longer hide from itself the knowledge that it has been dethroned by a supraordinate authority, the *self*. The *self*, the antithesis of the ego, consisting of the sum of conscious and unconscious processes, corresponds to the innumerable designations for the Gnostic savior figure of the *Anthropos*, including Christ (Jung 1951a, b). Elsewhere, he observes that Gnosticism projected the union of conscious and unconscious in the individuation process in the form of a drama of redemption into the heavens, equating ego-consciousness with the vain *demiurge* who fancied himself the sole creator of the world, and the *self* with the highest, *unknowable God* who emanated the *demiurge* (Jung 1949). For Jung, all Gnostic images or symbols of *aeons*, *archons*, etc., are expressions of the operation of unconscious psychic forces. Exposure to Gnostic mythological accounts of divine emanation in the twentieth century can trigger greater awareness of the complexity of intrapsychic processes, not only because such accounts provide a mirror for Jung’s modern clinical materials but also because they confirm that ancient Gnostics anticipated his psychological technique of active imagination (Jung 1944, 1955–1956; Merkur 1993).

Another reason for Jung's interest in Gnosticism can be traced to his identification of the typical Gnostic descent of *pneuma* (spirit) into *hyle* (matter) and its exile from the *pleroma* (fullness, denoting the transcendental field of divine reality) with the psychological process of projection, in which archetypal images of the unconscious are projected onto the outer world and lost there. Just as the Gnostic *pneuma* desires to lose itself in matter, often because it is attracted to its beautiful reflection in it, so the archetypal images of the unconscious desire to embrace the outer world. Projection is thus a process in which numinous unconscious contents are scattered in, and imprisoned by, the material world. Similarly, there is an equally striking correspondence between the Gnostic's account of *pneuma*'s release from matter or nature and its return home to the light of the *Unknown God* or *pleroma* and the psychic process of integration, in which numinous unconscious contents projected onto matter or nature are withdrawn from it and held in consciousness during the individuation process. As in the Gnostic release of *pneuma* from matter, so in the process of integration, there is disenchantment with the material world equated with psychic separation from it (Jung 1941/1954, 1944; von Franz 1975, 1985).

Jung's Distance from the Soteriological Perspective of Gnosticism

Nevertheless, Jung's individuation process cannot be identified with the soteriological goal of Gnosticism. Not only does Jung reduce the Gnostic metaphysical perspective to a psychological one (Segal 1992; Brewer 1996; Hanegraaff 1998), he also argues that the Gnostic godhead, the *Unknown God* or *pleroma*, is unconscious, without qualities or opposites, prior to their differentiation by the development of consciousness (Jung 1916/1992, 1951a, b; Segal 1992). Moreover, while the goal of anti-cosmic, dualistic Gnosticism, in Jungian terms, is to abandon ego-consciousness for the unconscious, the goal of analytical psychology is to unite the two. The ego's return to the unconscious, for Jung, is

merely instrumental to the latter's integration in consciousness. Whereas the Gnostic seeks to separate the spirit or divine spark from the material world, thus overcoming spiritual ignorance, Jung seeks ultimately to unite them. In Jungian terms the Gnostic goal must be understood at best as psychic dissociation (with its weakening of ego-consciousness) and at worst as outright psychosis (Segal 1992). Indeed, Jung argued that Gnostic anti-cosmic dualism is an expression of the psychopathology of inflation, which systematically avoids confrontation with the shadow. The enlightened Gnostic is incapable of resisting the temptation to identify his ego with the *self*, the inner Christ, or *Anthropos*, and as a result feels superior to the darkness within him. He has succumbed to the danger of becoming a god or higher man (Jung 1941/1954; White 1952; von Franz 1975; Brewer 1996; Segal 1998).

Jung, Carl Gustav, and Phenomenology

Roger Brooke

Department of Psychology, Duquesne University,
Pittsburgh, PA, USA

C. G. Jung's approach to psychology and to the psychological study of religious experience cannot be understood without an appreciation of his fundamentally phenomenological method.

Husserl's epistemological and scientific call to arms, "To the things themselves," announced the birth of phenomenology, which became one of the great intellectual movements of the twentieth century. In a number of places, the psychiatrist and psychoanalyst C. G. Jung (1875–1961) argues that his method of psychological analysis is phenomenological. However, his references to

phenomenology are always passing remarks, and his phenomenology is never systematically developed.

Jung's sense of phenomenology is evident most clearly when he contrasts his method and assumptions with those of his mentor, Sigmund Freud. Like other phenomenologists, Jung was consistently critical of Freud's materialist reductionism, namely, the attempt to explain the complex phenomena of psychological life in terms of the biologically based wishes and conflicts of childhood. Instead, said Jung, psychology should seek to understand its subject matter consistently on its own terms.

Phenomenology's insistence that phenomena be interrogated on their own terms was taken up by Jung especially with regard to religious experience. He argued that the meanings of the images and rituals of religious experience should be analyzed in terms that do not violate the integrity of religious experience. So too, more generally, should we approach the fundamental, organizing patterns of the human imagination, which are manifest in the myths and stories of the human species. These organizing patterns, or forms, which Jung called the archetypes, were structurally autonomous and thematically irreducible to terms of reference outside of their own orbits of meaning. For example, the Virgin Birth or the life of St. Francis needs to be understood psychologically in terms that honor the inner coherence and meaning of the image or the spiritual life of an extraordinary Saint. We should not, says Jung, reinterpret those phenomena, as Freudian psychoanalysis does, in terms of childhood wishes and anxieties, as though they were merely unconsciously determined and neurotic productions.

Jung's claim to being a phenomenologist rests on more than an understanding of its general approach. The characteristics of phenomenology's method are evident in Jung's work as well. These defining hallmarks of phenomenology are often taken to be description, the phenomenological reduction, the search for essences, and intentionality. Each of these will be briefly considered in turn, together with its place in Jung's work.

Phenomenological Description

Phenomenology is descriptive. Phenomenological psychology is not concerned with theoretical explanation or abstraction, but with phenomena as they concretely are present to us – just as we are, in turn, engaged with the appearing phenomena. This fundamental dialectic (the ground of the hermeneutic circle) means that the description of the meaning of phenomena has an interpretative moment that intuitively reaches through individual occurrences to their phenomenological heart or “structure.” Jung's method was generally a descriptive hermeneutic. It was a way of interpreting psychological meaning that stayed as close as possible to the phenomenon as it occurred. It was what Ricoeur called a hermeneutics of faith, unlike Freud's hermeneutics of suspicion. Jung studied phenomena primarily by looking for similar or contrasting images across cultures and history. Therefore, the depth that is sought in phenomenological description is a depth that lies within the phenomenon itself as a core, or structure, of meaning manifested in many diverse occurrences of that phenomenon.

Phenomenological Reduction

The phenomenological reduction is the systematic attempt to “bracket” theoretical and philosophical preconceptions, thereby to return our thinking to a more original ground in lived experience and conduct. Through this bracketing, the phenomenologist tries to approach the phenomena of psychological life in their vital contexts. It is this reduction that ensures phenomenology remains a descriptive enterprise. Jung repeatedly argued that philosophical materialism and rationalism foreclosed the possibility of an indigenous psychology, one in which its assumptions and methods were self-contained *as psychology*. He also repeatedly argued against the temptation to engage in “metaphysical” speculation when discussing religious experience. As a (phenomenological) psychologist, he wanted to open up a conceptual space for describing religious experience on its own terms, i.e., as

experience and not ontology. In other words, Jung did not want the study of religious experience to require an answer to the ontological question of whether or not God exists. Jung wanted his refusal to step beyond experience into ontology to be understood as a humble respect for his epistemological limits as a psychologist. However, as will be seen presently, his position was problematic, so that he has been criticized for psychologizing religious experience.

Search for Essences

The search for essences (eidetic reduction) is accomplished by considering the manifold variations of a phenomenon so that incidental, or perhaps transient, variations can be set aside and the essential structure can be intuited. The eidetic reduction reminds one of Jung's method of archetypal amplification, which sought to approach the essential core of meaning within the range of archetypal images and themes. The structural core of meaning was the archetype, distinguishable from the endless variation in archetypal images. Interestingly, just as the existential phenomenologists, following Heidegger's analysis of being as temporal, insisted that there are no historical essences, Jung came to realize that the archetypal cores of meaning can never be conclusively defined and that they require repeated reinterpretation.

Intentionality

Intentionality is not so much an aspect of method as a reminder that human being is always being in the world. Being in the world is the irreducible human occurrence of world disclosure, an open clearing (to use a Heideggerian expression) within which, or out of which, both the emerging person and world are gathered and constituted. Intentionality is a reminder that existence undercuts the Cartesian separation of subject and object, the place of experience (as mind or *res cogitans*) from the world in which all experience concretely takes place. Jung's description of psychological

types described the various ways in which the world is disclosed and engaged, the important point being that there is no disclosure of the world that is not already gathered in the attitudes (extravert or introvert) and functions (thinking, feeling, intuition, sensation) of consciousness. Significantly, even deepening introversion is described as an attitude in which the world becomes increasingly oppressive and persecutory. Another important recognition of human intentionality is Jung's consistent understanding of the living human body as already psychological and situated in its engagements with the world. The body, for Jung, is not primarily the body of anatomy, but the materiality of the soul. In this formulation Jung linked his understanding of human embodiment to Augustine's anthropology.

Critical Discussion

Despite these features of Jung's work that are phenomenological, the early phenomenologists were highly critical of him. Spiegelberg's classic study on the history of phenomenological psychology effectively dismisses Jung's significance and contribution. On his part, Jung thought Heidegger was mad and that phenomenologists were on an irrelevant philosophical rampage.

It is clear that Jung's understanding of phenomenology was superficial. From the disciplined phenomenologist's perspective, Jung failed seriously to bracket his philosophical, and specifically Cartesian, assumptions adequately, with the result that his work fails phenomenologically at crucial moments. It is significant, in this regard, that Descartes' name does not appear in the indices to the *Collected Works* of C. G. Jung or other writings. There is an irony here. Jung was justifiably critical of Freud's lack of philosophical reflection, because he recognized that Freud carried in his thinking philosophical positions that remained unquestioned and problematic. Yet the same is true when we consider Jung and the absence of Descartes in his indices.

The result is that Cartesian metaphysics, with its radical dualisms – mind and body, subject and world, inner and outer, etc. – tends to remain

awkwardly throughout Jung's thinking. For instance, he tends to speak of the archetypes in a neo-Kantian way as categories of perception (or imagination) that structure experience, yet he also refers to archetypal images, the objects to which we relate, as interior to the psyche and as produced by the archetypes. Both archetypal structuring of experience and the objects of experience itself are interior to the psyche. It might have been acceptable if Jung had simply described images of God as archetypal. The problem, for phenomenologists and most religious scholars, is that Jung then claims that we do not perceive, or relate to, God as such, but only to the God image, which is interior to the psyche. In some of Jung's writings, at least, neo-Kantian doubt becomes a Cartesian solipsism that is tightly shut.

It is not surprising that religious thinkers such as Buber, White, and Hostie had such difficulty with Jung. The otherness of God was reduced to the purely logical and formal category of the Kantian noumenon, beyond all thinking, imagination, and relationship. However, whereas, for Kant, the phenomenal world of experience was still the open realm of experience and evidence, for Jung the phenomenal world was conceptualized as interior to the psyche. For religious critics, one cannot be a solipsist and have any kind of thoughtful or affectively real relationship with God.

Jung tried to meet his critics by insisting that the psyche is not in us but that we are in the psyche, as the fish is in the sea – or, as we might say, as we are in language and cultural history. Jung's term "psyche" can be developed in terms compatible with the phenomenologist's "world." However, the conceptual confusion of psyche and mind is never clarified by Jung, so he and his religious critics continued to talk past each other.

On the other hand, this critical reading of Jung by phenomenologists lacks hermeneutic generosity. As was suggested above, Jung's method is closely aligned with the phenomenological tradition, which his work can enrich in several ways. Jung has much to say about psychological complexes, the archetypal structure and function of our mythic and cultural images, and the patterns of human development and transformation. He thematizes the imaginal structure of human

existence, showing that the quiddity of existence is not prior to its imaginal organization and self-disclosure. He then describes with great insight the imaginal patterns of the human world (Husserl's *Lebenswelt*), as well as the transhistorical sedimentations that continue to run through contemporary experience and thought. Jung's psychology of religion needs to be understood in these terms. In addition, his theory of psychological types suggests that there may be constitutionally different ways of being a religious person and that at least some of our theological, ritualistic, or experiential differences might be typological.

Finally, both phenomenology and Jung's analytical psychology have evolved over the years. A number of Jungians are phenomenologically sophisticated, and many phenomenologists have a greater appreciation for Jung's work. Jung's philosophical awkwardness is seen through and historically contextualized. To read Jung now, in the twenty-first century, is to reread Jung with a creative and critical engagement that honors his texts while interpreting them anew. In this way, hermeneutic questions and methods are threaded through both phenomenology and Jung's psychology.

Jung, Carl Gustav, and Religion

Leon Schlammm

School of European Culture and Languages,
Religious Studies Section, University of Kent,
Canterbury, Kent, UK

C. G. Jung's writings on religion were primarily focused on the value and function of religious experience in the historical development of human consciousness and particularly in the individuation process. Drawing heavily on Rudolf Otto's (1869–1937) account of numinous experience (derived from the Latin term for deity: *numen*), identifying the qualitatively unique, non-rational, *mysterium tremendum*, and *fascinans* moments of religious experience, Jung celebrated its significance for analytical psychology but, unlike Otto, located its source in the unconscious rather than beyond the psyche. As a phenomenologist of the psyche rather than a historian of religion or theologian, Jung explored the healing function of numinous experiences which provides the psychological foundation for religious creeds, while bracketing out any examination of metaphysical speculation about the objective reference of such experiences as beyond his professional competence (Otto 1923/1958; Jung 1934–1939, 1938, 1952/1973, 1956–1957, Moreno 1970; Heisig 1979; Stein 1985; Brooke 1991).

Jung's Definition of Numinous Experience

Jung defined numinous experience, following Otto, as inexpressible, mysterious, terrifying, and pertaining only to the divinity (Jung 1963).

Religion, he observed, can be identified with a careful and scrupulous observation of the numinosum, a dynamic agency or effect not caused by an arbitrary act of will. It seizes and controls the human subject, who is always rather its victim than its creator; it is an experience of the subject independent of his will, which causes a peculiar alteration of consciousness (Jung 1938). Identified by Jung with experience of the unconscious, its deeply stirring emotional effect, thrilling power, *mana* (psychic power) equated with holiness, and healing or destructive qualities are unusually persuasive from the psychological point of view (Jung 1928–1930, 1934–1939, 1947/1954, 1952a, b, c, 1952/1954, 1954a, 1960). Because numinous experiences are independent of conscious volition, transporting the subject into the state of rapture and will-less surrender, they are difficult to handle intellectually; since our affectivity is involved, absolute objectivity is more rarely achieved here than anywhere else. Indeed, they can be overwhelming, an admission that not only challenges our pride but also awakens our deep-rooted fear that consciousness may lose its ascendancy. It is because they may threaten the stability of consciousness that fear of them is justified, demonstrating a holy dread of the numinous. These experiences, identified with experiences of archetypal images understood as *daimonia*, can have a possessive or obsessive effect on consciousness (Jung 1942/1948, 1947/1954, 1952/1954, 1963).

Numinous Experience and the Individuation Process

However, in spite of these reservations, Jung regarded these fascinating and dreadful moments of numinous experience, triggering the ambivalent conscious responses to them of attraction and repulsion, longing, and horror, as fundamental to an understanding of the individuation process rather than belonging exclusively to the domain of psychopathology. Indeed, towards the end of his life, he declared that the experience of the *self*, intrapsychically encountered as other *to the ego*, carried with it a numinosity of such intensity that

it could be likened to the experience of being anchored in God (Jung 1906–1950, 1951–1961, 1955–1966; Papadopoulos 1984; Huskinson 2002; Dourley 2006; Main 2006; Stein 2006).

Nevertheless, Jung's measured appreciation of numinous experience, in contrast to Otto's unqualified submission to it, is evinced by his insistence on the clinical need at all costs to preserve the fragile autonomy of consciousness, threatened with disintegration by the fascinating, yet dangerous, numinous forces of the unconscious. One of the aims of the individuation process is to strengthen, even to extend, consciousness in the face of these numinous psychic forces.

Consciousness needs to maintain its independence from numinous unconscious contents by freeing itself from identification with them, if its conjunction with its opposite, the unconscious, the goal of the individuation process, is to be realized (Jung 1916/1928, 1944). It is this clinical perspective, expressing a "hermeneutics of suspicion" confronting numinous experience (Homans 1985) and a reservation in the face of divine decrees, which, for Jung, separates analytical psychology from Western and Eastern religious traditions. Jung insists that consciousness and the unconscious, equated by him with humanity and divinity, possess equal value and must strive to collaborate with one another in pursuing mutual transformation (Jung 1952/1954, 1963).

Jung's hermeneutics of suspicion is also evinced by his persistent preoccupation with the psychopathology of inflation of the ego by numinous experience and spiritual knowledge, producing experiences of self-deification and unjustified claims to absolute knowledge (Stein 2006). Overcoming spiritual inflation requires the ego's discrimination between its own boundaries and transpersonal, numinous psychic contents. The ego realizes that however powerful or intense a numinous experience may be, *it* is not that experience. Distinguishing his own deification experience of 1913 from the individuation process, Jung insisted that anyone identifying himself with a numinous experience is a crank, a fool, or a lunatic (Jung 1925). However much he valued the numinous experience of deification, the task of

analysis, for Jung, was to overcome identification with it, to separate oneself from it, and to realize that *I am not the god*. The experience of deification may occur towards the beginning of the analytical process; it certainly cannot be identified with its goal (Jung 1925, 1963; Noll 1994; Stein 2006). Jung's writings on inflation provide some of the most convincing evidence for his deconstructive relationship to religious experience and knowledge.

Jung's Psychotherapy of Religious Traditions

Again, Jung's critical engagement with both Western and Eastern religious traditions is illustrated by his claim that numinous experiences are typically the product of projections of archetypal unconscious contents onto the outer screen of nature. When coupled with his persistent profession, as a phenomenologist of the psyche rather than a metaphysician, of agnosticism with regard to the objective reference of such experiences outside the *self* or psyche, it is easy to understand why so many of his theological critics, as well as historians of religion, have charged him with psychologism, the act of reducing religious experiences to intrapsychic processes (Buber 1952/1999; Heisig 1979; Coward 1985; Homans 1985; Wulff 1985; Aziz 1990; Brooke 1991; Jones 1993; Clarke 1994; Palmer 1997; Stein 2006). Jung, responding primarily to his theological critics, persistently denied the charge of psychological reductionism on two grounds: first, that the unconscious or the *self* is unknown, just as God's essential nature is unknown to *experience* rather than to religious belief or doctrine, and second, that the psychological work of individuation is directed towards the integration of projected numinous unconscious psychic contents into consciousness, thus enriching, healing, and intensifying the conscious personality (Jung 1952/1973, 1954b, 1956–1957, 1963). Individuation is a progressive, but never completed process in which divinity is gradually incarnated within consciousness rather than experienced in projection, and consciously related to all other

areas of human experience, including instinctual life (Jung 1952/1954, 1963; Dourley 2006; Stein 2006). For Jung, those who have not realized that religious experience is wholly intrapsychic have not plumbed its depths (Dourley 2004).

During the last two decades of his life, Jung became increasingly preoccupied with the treatment of his own Christian tradition as a patient in need of psychological and spiritual healing (Stein 1985), prompting his critics to charge him not only with heresy but also with abandoning his own professed metaphysical agnosticism (White 1959, 1960; Moreno 1970; Heisig 1979; Homans 1985; Aziz 1990; Lammers 1994; Palmer 1997). In spite of his insistence on the common psychic origin and equal value of the deities of all religious traditions (Jung 1938), Jung offered his Christian and post-Christian readers an account of the evolution of the Western god-image challenging Christian salvation history (Jung 1942/1948, 1951, 1952/1954; Lammers 1994; Edinger 1996). Jung argued that Christ, the Western god-image of the *self* for the last two millennia, is incomplete; it lacks the tremendous moment of numinous experience, equated by him with the divine shadow, and therefore fails to express the conjunction of opposites, the goal of the individuation process. Because integration of the divine (archetypal) shadow into consciousness is necessary for individuation, Jung sought to direct his readers' attention to the immensity of God, the conflict between His overwhelming light and dark aspects, arguing that, contrary to the teachings of the Church, we have good reason to fear God, as well as to love Him. Moreover, Jung linked his observations about the divine shadow with his depth-psychological account of the historical evolution of divine consciousness, of the *individuation of God*, evidence for which he found in Biblical literature. Because God is less conscious than man, He depends on man to integrate His opposites of good and evil, to integrate *His shadow* for Him in order to achieve full consciousness, just as man reciprocally needs the numinous experience of God to transform his consciousness. The individuation and healing of God and man are thus codependent and realized only within human consciousness.

Jung, Carl Gustav, and the Red Book: *Liber Novus*

Lance S. Owens¹ and Stephan A. Hoeller²

¹Adjunct Clinical Faculty, University of Utah,
Salt Lake City, UT, USA

²Los Angeles, CA, USA

Description

The Red Book is an exquisite red leather-bound folio manuscript crafted by the Swiss psychologist and physician Carl Gustav Jung between 1915 and about 1930. It recounts and comments upon the author's imaginative experiences between 1913 and 1916 and is based on manuscripts first drafted by Jung in 1914–1915 and 1917. Despite being nominated as the central work in Jung's oeuvre (Jung 2009, p. 221), it was not published or made otherwise accessible for study until 2009.

While the work has in past years been descriptively called “the Red Book,” Jung did emboss a formal title on the folio's spine: he titled the work *Liber Novus* (the “New Book”). His manuscript is now increasingly cited as *Liber Novus*, and under this title implicitly includes draft material intended for but never transcribed into the red leather folio proper.

Composition and Publication

Liber Novus contains a literary and artistic recension of what has been called Jung's “confrontation with the unconscious,” an intense period of

imaginative activity accompanied by waking visions that began in 1913 and continued with variable intensity for about 6 years. In his biographical memoir, Jung clearly announced the centrality of these events to his life work. (Jung and Jaffe 1962, p. 170ff). Speaking to Aniela Jaffe in 1957, Jung stated:

The years . . . when I pursued the inner images were the most important time of my life. Everything else is to be derived from this. . . . Everything later was merely the outer classification, the scientific elaboration, and the integration into life. But the numinous beginning, which contained everything, was then (Jung 2009, p. vii).

Nonetheless, throughout his life and for nearly a half century after his death, the details of what happened during this period remained a mystery. Lacking access to Jung's own primary records, historians, biographers, and critics struggled to contextualize or understand these seminal years of activity and their profound influence upon his later work (Shamdasani 2005).

Jung kept an extensive and detailed record of his imaginative or visionary experiences – an endeavor he initially referred as “my most difficult experiment” (Jung 2009, p. 200). First, there were six sequentially dated journals, known as the “Black Books” (so named because of their black covers), which he began on the night of 12 November 1913 and continued recording through the early 1920s. The journals are the record of his experiment and might be described as his contemporaneous ledger of a voyage of discovery into an imaginative inner world; in *Liber Novus* he explains, “This inner world is truly infinite, in no way poorer than the outer one. Man lives in two worlds” (Jung 2009, p. 264).

During the initial months of fantasy activity, Jung conceived of his activity as primarily referent to his personal situation. After the outbreak of world war in August 1914 – an event presaged in visions Jung had recorded during the prior winter – the magnitude and meanings of his experience constellated in a broader context. What he had endured apparently had more than personal import; it was a reflection of a crucial cultural moment and it needed formal record. He began

that record by compiling an approximately 1,000-page draft manuscript detailing the initial flood of imaginative material recorded in his “Black Book” journals between November 1913 and April 1914, adding further reflections on its meaning. With this protean draft at hand, he next turned to creating an enduring testament to the experience.

With prodigious artistic craft – employing antique-illuminated calligraphy and stunning imagery – he labored for 16 years translating the manuscript records of his experiences into an elegant folio-sized leather-bound volume. This is the “Red Book,” titled *Liber Novus*, “The New Book.” Despite his extended labors on the transcription and accompanying symbolic artwork, the book was never finished; only approximately two-thirds of the text Jung compiled was transcribed into the Red Book. The remainder survives in his draft manuscripts.

Jung did not record *Liber Novus* as a private, aesthetic pretension. He clearly addressed it to readers in some future time, though from the beginning he was never quite sure when that time might come (Jung 2009, pp. 212f, 223). During his life Jung eventually allowed only a handful of his students and colleagues to examine the work; after his death in 1961, his heirs refused all requests for access to the Red Book and related materials.

Finally, in 2009 – with full cooperation of Jung’s estate and after 13 years of exhaustive editorial work by Dr. Sonu Shamdasani – *the Red Book: Liber Novus* was published in a full-sized facsimile edition, complete with an English translation, the concluding portions of manuscripts not transcribed into the Red Book volume, a comprehensive introduction, and over 1,500 editorial notes, including excerpts from Jung’s Black Book journals and other previously unknown contemporaneous documents. Editions in multiple languages soon followed. In sum, publication of *the Red Book: Liber Novus* signaled a watershed moment in the understanding of the life and work of C. G. Jung. In its light, Jung’s legacy is undergoing an intense reconsideration (Stein 2012).

The Threshold of Vision

A comprehensive understanding of *Liber Novus* requires consideration of the singular visionary activity underlying the text, the hermeneutic method employed in translating these imaginative experiences to literary form, the signal themes emerging from the book as a whole, and the influence of the entire project on Jung’s subsequent work. Among these tasks, understanding what Jung experienced in his “waking dreams” or “visions” – the imaginative activity that is foundational to *Liber Novus* – is perhaps the primary and most difficult one.

For several years prior to 1913, Jung’s interest had focused on the evidence he saw in myths, dreams, fantasies, and psychotic delusions of an autonomous myth-making function inherently underlying human consciousness. The psyche – the soul – seemingly expressed itself in an arcane language of myth and symbol. To further understand the psyche, Jung recognized a need to investigate this mythopoetic substratum of consciousness. During the same period, he was increasingly disillusioned with theoretical constructs about the origin and nature of unconscious contents – a disenchantment that led to termination of his 6-year misadventure with Freud. As he explained in the draft manuscript of *Liber Novus*, speaking of his situation around this time, “I had to accept that what I had previously called my soul was not at all my soul, but a dead system that I had contrived” (Jung 2009, p. 232 n39).

Around the beginnings of 1913, Jung noted growing internal turmoil. This crested in October of 1913 when he was overcome by the spontaneous and detailed vision of a monstrous flood of blood covering all of Northern Europe up to the Alps. The same vision recurred 2 weeks later and again lasted for about an hour (Jung and Jaffe 1962/1983, p. 175). The eruption of two visual hallucinations portending vast death and destruction caused Jung to fear that he was “menaced with a psychosis” (Jung and Jaffe 1962/1983, p. 200; Jung 2009, p. 198). Over the next weeks, he outwardly surveyed his situation, seeking some therapeutic or palliative insight. Finding none, he

determined to search inward. And so, on the evening of 12 November 1913, Jung sat at his desk, opened his journal, and addressed the mystery petitioning him:

My Soul, where are you? Do you hear me? I speak, I call you—are you there? I have returned, I am here again. I have shaken the dust of all the lands from my feet, and I have come to you, I am with you. After long years of long wandering, I have come to you again. . . . (Jung 2009, p. 232).

This journal entry begins the record that became *Liber Novus*. But the course then before him was obscure. He had no theory or concept to explain what he was doing, whom he was addressing, or how he should proceed. He determined to simply let things happen, let the unconscious have a voice. During twenty-five subsequent evenings, he practiced turning off outward consciousness and engaging any awaiting unconscious contents. Slowly, responses began to come, finding voice through him. He explained, “Sometimes it was as if I were hearing it with my ears, sometimes feeling it with my mouth, as if my tongue were formulating words; now and then I heard myself whispering aloud” (Jung and Jaffe 1962/1983, p. 178).

By early December 1913 Jung discovered that his focused imaginative activity could evoke autonomous visionary scenes, personages, and dialogic interactions. The initial vision is recorded in his journal on 12 December 1913 and recounted in *Liber Novus*: “The spirit of the depths opened my eyes and I caught a glimpse of the inner things, the world of my soul, the many-formed and changing. . . .” (Jung 2009, p. 237)

In the introduction to *Liber Novus*, Dr. Shamdasani further explains:

From December 1913 onward, he carried on in the same procedure: deliberately evoking a fantasy in a waking state, and then entering into it as into a drama. These fantasies may be understood as a type of dramatized thinking in pictorial form. . . . In retrospect, he recalled that his scientific question was to see what took place when he switched off consciousness. The example of dreams indicated the existence of background activity, and he wanted to give this a possibility of emerging, just as one does when taking mescaline (Jung 2009, p. 200).

With almost nightly frequency through January 1914 and then more sporadically until the early summer of 1914, Jung volitionally engaged “visual fantasies” or “visions.” He recorded about thirty-five major visionary episodes in his journals during this period; these accounts along with commentary appended the next year comprise the first and second sections (“*Liber Primus*” and “*Liber Secundus*”) of *Liber Novus*. The majority of this material was recorded into the red leather folio. A final section, compiled in 1917 and titled “*Scrutinies*,” adds account of a second period of visionary activity between late 1915 and 1916. This last section exists in draft manuscript and contains Jung’s summary revelation to *Liber Novus*, the “*Septem Sermones ad Mortuos*” (Seven Sermons to the Dead). Independently titled and privately printed by Jung in 1916, these summary sermons comprise a vast cosmogonic myth and are the only portion of *Liber Novus* disclosed and distributed by Jung during his lifetime (Hoeller 1982).

Thematic Content of *Liber Novus*

While many alternative summaries are possible, the following list reflects themes Jung focused upon in his own consideration of the text.

Reclaiming the Soul

At the outset of his experiment, Jung recognized the need to reclaim and revalorize something lost and forgotten by his age. In the opening pages of *Liber Novus*, the primordial power of the “spirit of the depths” confronts the arrogant “spirit of this time” – the secular materialism and positivistic science that dominates European culture. The spirit of the depths instructs Jung to turn away from the spirit of the time and to look into the depths, to speak to his soul, “to call upon her as a living and self-existing being” (Jung 2009, p. 232). *Liber Novus* recounts Jung’s struggle to reclaim the soul; and it exposes the method by which he revalorizes the soul’s mythopoetic and symbolic voice.

Experiencing God

Early in the dialogue, Jung petitions his soul: “I am ignorant of your mystery. Forgive me if I speak as in a dream, like a drunkard – are you God?” (Jung 2009, p. 233). This question resonates throughout *Liber Novus*. In his journey through vision, Jung confronts God not as a theological concept, but as an experience encompassing light and dark qualities and as a fact in intimate relationship with human consciousness.

Renewing the God Image

In a keynote fantasy, Jung meets Izdubar, an ancient god from the East. The meeting goes tragically wrong – confronted by Jung’s toxic modernity, Izdubar is stricken and sickened unto death. The dying Izdubar asks Jung if his Western lands have gods. Jung replies, no, just words. Having lost contact with the experience of deity, only verbal concepts remained. Jung undertakes the healing and regeneration of the stricken god. A theophanic recognition ensues: “I am the egg that surrounds and nurtures the seed of the God in me” (Jung 2009, p. 284).

Imitating Christ

His visions inexorably led Jung toward confrontation with the *imitatio Christi*; this becomes a leitmotif throughout *Liber Novus*. Jung surveys what it means to be not just a Christian believer, but a Christ – a full and conscious participant in the act of redemption. Near the end of *Liber Novus*, Christ appears in a vision and is addressed:

My master and my brother, I believe you have completed your work. ... What one individual can do for men, you have done and accomplished and fulfilled. The time has come when each must do his own work of redemption. Mankind has grown older and a new month has begun (Jung 2009, p. 356).

Harrowing Hell

In an astonishing passage, Jung declares: “No one knows what happened during the three days Christ was in Hell. I have experienced it.” Indeed, two evenings after witnessing a rebirth of the God – which he describes as a vision of “eternal

light, immeasurable and overpowering” (Jung 2009, p. 286) – Jung descends into Hell; he confronts the ultimate darkness of evil. This horror he must acknowledge as resident within himself and all humankind. He concludes, “Man must recognize his complicity in the act of evil” (Jung 2009, p. 291). The work of redemption demands conscious confrontation with the existential fact of evil.

Conjoining Opposites

Throughout *Liber Novus* Jung attempts to come to term with what has been rejected, with the opposite, the adversary: the missing half that brings wholeness and heals the wound of one-sided consciousness. He explains, “You begin to have a presentiment of the whole when you embrace your opposite principle, since the whole belongs to both principles, which grow from one root” (Jung 2009, p. 248). In *Liber Novus*, unification of the opposites has not only personal developmental implications but also a profound soteriological function.

Prophesying a New Age

Liber Novus has a distinctly prophetic tenor. While Jung adamantly rejected the mantle of prophet, his “new book” certainly challenges readers with its prophetic voice. On the first folio page of *Liber Novus*, Jung begins by quoting Latin Vulgate verses from Isaiah and the Gospel of John – prophetic words read over two millennia as prelude and prologue of the Christian age. Even the title – *Liber Novus*, the “New Book” – asks readers to contextualize his text against historically received testaments of prophetic vision. A comment by Jung, recorded in 1923, places the book’s tenor in an even stranger perspective: Jung privately avowed to a close disciple his impression that the guiding figure behind *Liber Novus* “was the same who inspired Buddha, Mani, Christ, Mahomet – all those who may be said to have communed with God” (Jung 2009, p. 213).

Among many possible readings, *Liber Novus* can be read as a prophetic book. And throughout *Liber Novus* one paramount prophetic declaration recurs: the Christian age has reached its terminus;

the aeon of Pisces is nearing its end. Humankind stands at the difficult threshold of a new age of consciousness, heralded by a transforming divine image. Jung had seen it (Owens 2011).

Influence on Jung's Later Work

C. G. Jung has most frequently been categorized encyclopedically as psychologist and founder of analytical psychology. But *Liber Novus* – described by its editor as “the book that stands at the center of his oeuvre” – is distinctly not a clinical or theoretical work of psychology. The word psychology does not appear in the text even once. If this is the foundation to Jung's lifework – or, as Jung said, “the numinous beginning, which contained everything” – then his work has to date been inadequately contextualized and too narrowly characterized (Shamdasani 2012b).

Between 1913 and about 1920, Jung's engagement with imagination and its mythopoetic voice offered direct empirical evidence of an apparently autonomous psychoid realm underlying consciousness. Though it was a rare experience, focused engagement and dialogue with this otherwise inherently unconscious dimension opened measureless perspectives on the nature of consciousness itself. While potentially overwhelming and disorienting, the process of accessing and interacting with this realm – through functions of dream, fantasy, imagination, and vision – had a transformative and expansive effect on human consciousness. This Jung witnessed with his own life.

Jung's experiment, formally documented in *Liber Novus*, provided him with a unique perspective on mystical and revelatory religious experience and on the general human propensity for mythic and imaginative expression. The primary hermeneutic task of translating into text and symbolic image his own encounter with mythopoetic imagination subsequently informed his recognition and appreciation of other similar enterprises in history. His extensive writings on mythology, Eastern and Western religious traditions, alchemy, Hermeticism, and Gnosticism are all influenced

by a hermeneutics of human imagination and vision grounded in his own experiences recorded in *Liber Novus* (Shamdasani 2012a).

The reassessment of Jung's life and work under the revelatory light of *Liber Novus* is a generational task only recently begun. As this effort proceeds and the foundation of C. G. Jung's hermeneutic enterprise is better understood, it is likely that the influence and appreciation of his work will reach far beyond the cloisters of analytical psychology. As Sonu Shamdasani suggested shortly after publication of *Liber Novus*:

If, as Jung claimed, Dante and Blake clothed visionary experience in mythological forms, could we not pose the question: Did Jung in turn attempt to clothe visionary experience in conceptual psychological forms? If so, the power and significance of his work does not reside in his concepts, which are familiar to us, but in the visionary experience which was at the back of them (Shamdasani 2010).

Jungian Feminists

Vivianne Crowley

Cherry Hill Seminary, Columbia, SC, USA
Department of Psychology, Nottingham Trent University, Nottingham, UK

The term “Jungian feminists” can be applied to feminist Jungian analysts and to feminist scholars of Jungian theories.

The theories of Carl Gustav Jung (1875–1961) about the psychology of women and the feminine were radical for their time, but it is important to set them in context and note that the major goal of first-wave feminism – women’s universal suffrage – was not achieved in his Swiss homeland until 10 years after his death. In Jung’s lifetime, the dominant societal view was that women were either inferior to men or “equal but different” with biologically determined spheres of influence and role.

Jung was aware that as a man there were deficiencies in his understanding of women (Jung 1927/1970, p. 117; para. 240). Nevertheless, he was often blind to his own social conditioning. Jung considered that our inner relationship with the contra-sexual “other” in the psyche – for a man his *anima*, for a woman her *animus* – was fundamental for psychological health and for constructive relationships between the sexes, but derided women “ridden by the animus” who challenged men intellectually. He argued that women’s strength was in the feeling realm of *Eros* and

that in the intellectual realm of *Logos*, women’s thinking was contaminated by “commonplaces, misapplied truisms, clichés from newspapers and novels, shop-soiled platitudes of every description interspersed with vulgar abuse and brain splitting lack of logic” (Jung 1951/1968, p. 15, para. 29).

While many first-generation women analysts would not have labelled themselves feminist, they both challenged and revised Jung’s theories, finding that they did not adequately address or describe the psychological reality of female clients or their lives as women. Emma Jung in *Animus and Anima* argued that with psychological maturation, women would reclaim as their own the qualities projected onto their *animus* (Jung 1957). Others challenged Jung’s view that women were dominated by *Eros* and that “A man should live as a man and a woman as a woman” (Jung 1927/1970, p. 117; para. 240). Toni Wolff proposed that *Eros* is not women’s only mode of conscious functioning. She developed a fourfold typology of women as primarily mother, *hetaira* (in ancient Greece, an educated female courtesan), medial woman, or Amazon. While earlier generations might be limited to only one of these types, Wolff looked to contemporary women to embrace more (Wolff 1934/1941).

Jungian Goddess Feminism

Other analysts, rather than questioning Jung’s ideas about women and *Eros*, elevated *Eros* as an empowering mode of being. Building on Jung’s work on religious symbols and myths, they turned to ancient goddess religions for strong and powerful archetypal images of goddesses and the feminine that could help women understand and embrace their true nature. In her book *Women’s Mysteries*, Esther Harding, co-founder of the New York C. G. Jung Institute, called for modern women with careers not to become “men in petticoats” or to lose touch with “the feminine principle within themselves” (Harding 1935/1955/1971, p. 16). Instead they could develop their *Eros* nature by identifying with the “Moon Mother” not as a religious cult but as a “psychological force” (Harding 1935/1955/1971, p. 241).

The *Eros* principle was important also for men, whose inner conflicts would only be resolved when the masculine and feminine principles inherent in everyone were reconciled (Harding 1935/1955/1971, p. 37).

Analyst Erich Neumann developed goddess feminism further in his important book *The Great Mother*, arguing that while the matriarchal era of the Great Mother goddesses represented a more primitive phase of human development, the “feminine-maternal wisdom” and “loving participation” of “lunar” consciousness, or *Eros*, was needed by women and men as an antidote to modern patriarchal society (Neumann 1955/1963, pp. xlii, 330–333).

Second-Wave Feminism Criticisms of Jungian Thought

Moves to reject male patriarchal religious images became more prominent in the 1970s when second-wave feminism’s struggle for gender equality, equal rights in the workplace, and reproductive rights focused attention on psychological theories that could be oppressive and disempowering for women. Some Jungians continued to accept Jung’s ideas about women and the feminine and found in them a source of inspiration for challenging the suppression of the feminine in monotheistic religious traditions. In *The Feminine in Jungian Psychology and in Christian Theology*, analyst Ann Belford Ulanov, Professor of Psychiatry and Religion at Union Theological Seminary, argued for a feminine mode of knowing that would see feminine interpretations of the Divine become equally valued to those of patriarchal Christian theology (Ulanov 1971).

Outside Jungian psychology sustained criticism of Jung’s theories began to emerge from feminist scholars of theology and religious studies. Mary Daly criticized “Jung’s garbled gospel” for projecting an illusion of equality in which women became grateful for “complementarity” and token inclusion (Daly 1978, p. 280). Carol Christ pointed out how Jungian psychology’s symbols have psychological and political effects that can create conditions in which women feel

comfortable with and acquiesce to oppressive social and political systems (Christ 1979). Naomi Goldenberg called for Jungian analysts and scholars to confront the inherent sexism in Jung’s language, models, and archetypes, arguing that “if feminists do not change the assumptions of archetype or redefine the concept, there are only two options: either (1) to accept the patriarchal ideas of the feminine as ultimate and unchanging and work within those or (2) to indulge in a rival search to find female archetypes, ones which can support feminist conclusions” (Goldenberg 1976/1990). Goldenberg favored redefining the idea of “eternal” archetypes, such as *anima* and *animus*, as socially, culturally, and historically determined archetypal images. This would overturn the notion that “women are the way they are because they are conforming to something out there which can never change” (Goldenberg 1976/1990).

The 1980s saw important revisions to Jung’s theories about archetype and his core process of individuation, or psycho-spiritual maturation, from within and without the Jungian establishment. Jungian analyst Sylvia Brinton Perera’s *Descent to the Goddess* interpreted the ancient Sumerian goddess Inanna’s descent to the underworld as a metaphor for women’s psychological development and, while not rejecting the concept of individuation, recast it to better mirror the experiences and lives of contemporary women (Perera 1981). The theme of women’s individuation was developed further by psychologist of religion Demaris Wehr in *Jung and Feminism: Liberating Archetypes*, in which she contends that the “ego-annihilation” stage of individuation, while perhaps appropriate for men, is not a pattern of development relevant to a woman who does not yet have a sense of self, identity, or personal agency (Wehr 1987/1988, p. 101). Wehr views Jung’s psychology as appealing in its emphasis on the spiritual dimension of life (Wehr 1987/1988, p. 124), but argues that it is a symbol system with political and social ramifications that supports the prevailing “gender-based social order” (Wehr 1987/1988, p. 22). Wehr argues that Jungian theory and practice would be strengthened by feminist principles and criticizes Ulanov’s work, among others, for its reliance on outmoded biological

and ontological explanations for women's socially determined behavior (Wehr 1987/1988, p. 13).

Third-Wave Feminism and Beyond

The late 1980s onward were characterized by the demise of the grand narrative of Western social and economic progress in the face of economic and social volatility, dissolution of traditional family patterns, greater gender equality, converging sex roles, more fluid sexual expression, and a subverting of traditional female images through “girl power.” This created a new and more receptive climate for Jung's theories. Leading Jungian scholar and social and political commentator Andrew Samuels points out that Jung “had a remarkable capacity to intuit the themes and areas with which late twentieth-century and early twenty-first-century psychology would be concerned: gender; race; nationalism; cultural analysis; the perseverance, reappearance, and socio-political power of religious mentality in an apparently irreligious epoch; the unending search for meaning” (Samuels 1997). The emergence of third-wave feminism saw a reevaluation of Jung's theories of sex and gender and new interpretations by feminist scholars, including from the perspective of feminist archetypal theory (Lauter and Rupprecht 1985).

A major contribution was scholar Susan Rowland's *Jung and Literary Theory*, in which she set out to address Jung's writings with the same level of analysis already applied to Freud and to “initiate the process of absorbing Jungian theory into modern critical discourses such as deconstruction, feminism, postmodern spirituality, reader-response and post-colonialism” (Rowland 1999, p. 1). While expressing reservations about Jung's “powerful misogynistic drive to collapse women into animas” (Rowland 1999, p. 16), in her important book *Jung: A Feminist Revision*, she argues that polytheistic goddess archetypes provide “a real opportunity for feminism in undoing the patriarchal exclusions written into monotheism” (Rowland 2002, p. 78). This allows for a Jungian feminism that is “socially oriented in looking for cultural pressures and effects within the feminine psyche,” while not being “a

materialist feminism, because it retains the core Jungian notion of the creative *otherness* of the unconscious” (Rowland 2002, p. 86). Abandoning Jung's “grand theory” of the goal of human psychological development as being a stable self, postmodernist Jungian feminist psychology could offer an “experiment of the imagination” with “fictions of the self for a postmodern era” (Rowland 2002, p. 48) and a route to the psychological integration of the fragmented self through personal myth making (Rowland 2002, p. 73).

Freudian psychoanalyst and philosopher Elisabeth Young-Bruehl has similarly commented favorably on the potential for Jungian theories to meet the concerns of third-wave feminism, arguing that “this therapy is about learning what story (in part told to you by others) you tell yourself and about learning to tell it differently, turning to other women as your hearers and helpers so that at a certain tipping point you become different” (Young-Bruehl 2009). Young-Bruehl notes also that Jungian psychology, with its celebratory ideas about the feminine principle, can give birth to political feminist initiatives. She cites the women's activism movement, *The Millionth Circle*, inspired by Jungian analyst and feminist thinker Jean Shinoda Bolen (1999/2003). Bolen's book *Goddesses in Everywoman* (Bolen 1984) drew on ancient goddesses as empowering archetypal images representing the full spectrum of women's experience. In recent decades, with wider and more fluid concepts of sexual identity, Bolen comments that both men and women can find that a particular goddess or god exists within them. Bolen's new postmodernist conclusion is that “The pantheon of Greek deities together, male and female, exist as archetypes in us all” (Bolen 1984/2014).

With the advent of fourth-wave feminism, Jungian feminists are creatively adapting Jung's work to meet the needs of future generations of feminist women and men.

Jungian Self

J. Pittman McGehee
Research Center, Saybrook Graduate School, San Francisco, CA, USA

The Self for Jung was the archetype of wholeness and the organizing principle of the psyche. In volume 12, paragraph 44 of his *Collected Works*, he writes: “The self is not only the centre, but also the whole circumference which embraces both conscious and unconscious; it is the centre of this totality, just as the ego is the centre of consciousness” (1953/1970).

This paradoxical concept is both the essence and the totality of one's personality. The Self initiates life and it is life's goal. Jung's concept of individuation depends on one becoming one's true, autonomous, and authentic self. The ego is the organ of consciousness. The goal of the second half of life is for the ego to subordinate itself to the supraordinate Self. In his autobiography, Jung writes: “In those years. . . I began to understand that the goal of psychic development is the self. There is no linear evolution; there is only the circumambulation of the self.”

The Self is a transcendent or divine quality. Jung referred to the Self as the “Imago Dei,” or the image of God within the psyche. Borrowing from theologian Rudolph Otto's book, *The Idea of the Holy*, Jung posited that the self possessed a

numinous quality. Numen is divine power or energy. This numinous energy of the self has the power to generate, transform, and integrate psychic life. This is the religious nature of the psyche.

One cannot know an archetype, only its images. There are many images of the Self: the mandala, king, hero, prophet, and savior. Jung considered the Christ and the Buddha as symbols of the Self. In volume 9 part II of his *Collected Works*, entitled “*Aion*,” Jung devotes his most extensive treatment on the “phenomenology of the self.”

Robert Hopcke in his work, *A Guided Tour of the Collected Works of C. G. Jung*, writes: “While the editors of the ‘Collected Works,’ do not capitalize self, – in English the consention has since developed of referring to the individual ego as the ‘self,’ with lowercase s, and the archetype as the ‘Self,’ with a capital S” (Hopcke 1989).

K

Ka'bah

Ali Ayten

Department of Psychology of Religion, Marmara University, Istanbul, Turkey

It is the one and only pilgrimage site for Muslims located in the city of Mecca, Saudi Arabia. It is an ancient cubic-shaped building called the House of God (*Baitullah*). The word *Ka'bah* means cubic.

It is not known who built the Ka'bah first, but it is known that it was established before Prophet Abraham and was rebuilt by him and his son Ishmael. After Prophet Abraham, it was rebuilt three times by the Arab tribes. The Ka'bah was visited according to the principles of monotheism from the time of Abraham until the idol-worshippers of Mecca took it over to accommodate idols in and around it. When Prophet Muhammad conquered Mecca after migration to Medina, he removed all idols, and it remained in the hands of Muslims since then. After Prophet Muhammad, its original form and size ($11 \times 12 \times 15$ m) was preserved except for some renovations, and it was covered with a black cloth.

According to Islamic faith the Ka'bah is the first place of worship on earth (Qur'an 3:96). And the city of Mecca is called *Umm al-Qura* (mother of cities). The visit to the Ka'bah is called *hajj* (pilgrimage). The pilgrim is called *haji*, which is a

highly respected title in the Islamic world that encourages one to live a moral and religious life by keeping away from sinful acts. Muslims who can afford it financially and physically are enjoined to visit the Ka'bah once in a lifetime on the specified days in each year. Visits to the Ka'bah at other times are called *umrah*. Muslims throughout the world face toward the direction of the Ka'bah for the five-daily prayers. This act of prayer and coming together for pilgrimage every year gives the worshippers a sense of union and brotherhood. The Ka'bah is, in this sense, not the end point, but a starting point to the transcendent. And as the times of five-daily prayers are set according to the daily movement of the sun, there are always Muslims somewhere in the world facing the Ka'bah at anytime of the day. In Sufi psychology, the Ka'bah is metaphorically associated with the heart in that breaking someone's heart is believed to be equal to demolishing the Ka'bah.

Currently, around three million Muslims of different colors, races, and nations visit and circumambulate the Ka'bah each year. Pilgrims wear white garments during *hajj* which represents the fraternity of all races and nations. Pilgrims also place their hands on the black stone (*Hajar al-Aswad*), which is believed to have descended from the heavens, located in the east corner of the Ka'bah at every turn of circumambulation to renew their submission.

Kabbalah

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

An esoteric rabbinic tradition, Kabbalah (Hebrew, *kblh*, “receiving,” “tradition”) became manifest especially in late twelfth and early thirteenth century CE Provence in southern France. Based on the mystical interpretation of the *Torah*, the disclosing of Kabbalic secrets occurred as a response to the influence of Maimonides (1135 CE–1204 CE) and his philosophical reading of the *Torah*. Early Kabbalah literature includes *Sefer ha-Bahir* (*The Book of Clarity*), patterned after ancient rabbinic Midrash, and also the series of writings from the family and close circle of Rabbi Abraham ben David of Posquieres (ca. 1125 CE–1198 CE). The most important writing is the *Zohar* (Hebrew, “brightness”), a writing coming out of the Kabbalists in Castile, Spain. The *Zohar* consists as a collection of texts written in Aramaic and Hebrew dating from a period between about 1280 CE and 1310 CE. Its central symbol, the Kabbalah tree, consists of the ten *sefirot* or aspects of the divine personality. Nine of these issue from *Keter* (“Crown”), the first *sefirah* on the top of the tree which is one with *Ein Sof*, the endless and infinite reality of God. The sixth *sefirah* *Tiferet* (“splendor”) exists below *Keter* and is understood as being the central “beam” in the divinely constructed universe. Its central location within the tree forms two triads through which cosmic life force courses into the final two *sefirot* of *Yesod* and *Malkhut*. The *sefirot* of *Malkhut* (“kingdom”) receives all the flow from

the upper *sefirot* and rules over the lower worlds. She is also called *Shekhinah* (“presence”), the queen and feminine element which in the early Midrash is said to abide with Israel into exile. The Kabbalists eventually merge the *Shekhinah* and the community of Israel, thus giving divine status to the human community – something unique within Jewish tradition. The *Zohar* begins with Genesis 1:1 and the divine name *Elohim*, “God” which refers to the third *sefirah* of *Binah*, the Divine Mother. Between the two occurrences of the divine name in Genesis 1:1 are 13 words, which are the 13 qualities of compassion (Exod. 34:6–7). The *Zohar* significantly expands previous Kabbalah traditions with its focus on the *mysterium coniunctionis* and the uniting of the male sixth and ninth *sefirot* with the female tenth *sefiri*. Distinct from the philosophical Neoplatonic Kabbalah of the Catalanian circles, the Castilians show intrigue with teurgic, quasi-magical influence in relation to the divine and how such influence creates union and subsequent flow of blessing upon the lower world. As a mystical writing, the *Zohar* represents and occurs as a medium of religious experience inseparably connected with unconscious movements of the writers (and reader). These movements are brought forth into conscious expression through the highly symbolic language and experience of language of the book. The *Zohar* came to be regarded within Judaism as revealed text having authority comparable to the *Bible* and the *Talmud*. As a religio-spiritual tradition, it is preceded by *Merkabah*, “chariot vision literature,” and followed by Hasidism with its concern for the omnipresence of God and the notion of unbroken discourse/communion between humanity and God.

Kabbalah and Psychology

Charlotte Moore

West Chester University of Pennsylvania, West Chester, PA, USA

Kabbalah is an esoteric form of Jewish mysticism that emerged in the twelfth century and that focused primarily on esoteric interpretations of the *Torah*. Kabbalists employed various forms of meditation and prayer to induce mystical states of consciousness and initiate a process of psycho-spiritual transformation.

The Kabbalists posited a tripartite division of the soul, not unlike the theories of Plato and Aristotle in ancient Greek philosophy (Tishby 1995, p. 128). In Kabbalah, the parts of the soul were called *nefesh*, *ruach*, and *neshamah* (Tishby 1995, p. 127). Some Kabbalists add to this the *guf*, or physical body (Halevi 1986, p. 35). The idea was that although the soul functions as a unity, it holds within it divisions, each with their own function and *sefirotic* attribution. Kabbalistic psychology seeks to understand the manner in which these divisions interact, with the goal of the psychological process being to balance these components such that the individual can receive and live in accordance with divine will, guided by the “highest,” most divine aspects within the human psycho-spiritual constitution.

The *guf*, as mentioned above, is the physical body (Halevi 1986, p. 35). Closely related to the physical body is the *nefesh*, which is considered to be the “lower” part of the soul, with its function being similar to the animal or instinctive consciousness. It is “attached to the body, preserving

it and satisfying its needs” (Tishby 1995, p. 120). Thought to be an almost untamed or wild part of the human psyche, it was sometimes even associated with evil, or the *sitra ahra*, or “other side” (Tishby 1995, p. 127). Contemporary psychologists and Kabbalah scholars often compare the *nefesh* with the *id* in Freudian theory and the instinctive unconscious in Jungian theory given its relationship to those functions within human consciousness associated with survival, such as the autonomic nervous system, reflexes, and reactive patterns (Halevi 1986, p. 112). Comparisons are also drawn between the *nefesh* and the Jungian shadow, since its functions are largely unconscious (Halevi 1986, p. 137).

The *ruach* is generally considered to be the human faculty of self-conscious awareness, or self-consciousness. In Jungian terms, it is associated with the Self, rather than the persona, or personality (Halevi 1986, p. 108). It serves as an intermediary between the *nefesh* and the *neshamah*, as is therefore the “middle” part of this tripartite unity (Tishby 1995, p. 121). It is said that the task of the *ruach* is “to illumine the *nefesh* and to sustain it with light and influence that flow down upon it from the *neshamah*. To match this bridging and intermediary role, it is often described as the throne of the *neshamah*, or the luminary of the *nefesh*” (Tishby 1995, p. 121). It is sometimes also associated with the emotional or intellectual functions and is further subdivided into various components of self-awareness, such as desire, imagination, and intellect (Tishby 1995, p. 121).

The *neshamah* is said to be the highest part of the soul and is even sometimes considered to be the soul itself (Tishby 1995, p. 113). Tishby says, “it is the power of the *neshamah* that enables man to study Torah and observe the commandments...the *neshamah* is active in the perception of the divine mystery” (Tishby 1995, p. 120). The *neshamah* could, in Jungian terms, be likened to the spiritual or intuitive consciousness and is an aspect of the psyche that guides humans to seek spiritual wisdom and union with the divine. Given that, it seems logical that “once

man [i.e., humanity] has arrived at a perception of the divine mystery through knowledge of the secrets of the Torah he [or she] is able [or]... obliged, to activate his [or her] soul into unifying the *sefirot* and... carry out those theurgic tasks which constitute the supreme and final good” (Tishby 1995, p. 120).

Some scholars add to this a *yechidah*, the highest and most spiritual aspect of the psyche, associated with the Jungian collective unconscious. In this scheme, the *chiah*, or life-force, is the divine will and serves as a complementary force to the *neshamah*, the intuitive or receptive faculty (Halevi 1986, p. 185).

The manner in which the *sefirot* are unified, from this perspective, is by way of the attributions of the parts of the soul to the *sefirot*. There seems to be some controversy regarding these attributions, as different passages in the *Zohar* and other various Kabbalistic texts offer contradictory interpretations. The most common and agreed-upon system of attribution places the *yechidah* at *Kether*, the *chiah* at *Hokhmah*, the *neshamah* at *Binah*, the *ruach* at *Tiferet*, the *nefesh* at *Yesod*, and the *guf* at *Malkuth*. Other sources suggest that the *neshamah* is at *Binah*, the *ruach* at *Tiferet*, and the *nefesh* at *Malkuth* (Tishby 1995, p. 125). The *sefirot* are seen as emanations of the divine, with *Binah* being a divine feminine mother principle, *Tiferet* being a son (of *Binah* and *Hokhmah*), and *Malkuth* being the daughter, lesser mother, or Kabbalistic bride. If the parts of the soul are then mapped out onto that, one could conclude that the higher soul emanated first but was a hidden light within, a spark of the divine, followed by the divine will and a receptacle or divine form. The *ruach* would then be an intermediary function, as suggested above, and the *nefesh* would be in one sense a receptacle (or perhaps a mirror) for the light of *neshamah* through this mediation or a polar opposite principle, which would give it the connotations of evil it later inherited. The process would be one of the psychodynamics, in which the instincts and the spiritual impulses are reconciled in one’s life, as one attempts to attain knowledge of the Godhead within and then live a life that is governed by that “highest” dimension of the Self.

Kabir

Ali Kose

Ilahiyat Facultesi, Marmara Universitesi,
Istanbul, Turkey

It is an Arabic and Islamic name for tomb. It is a usual practice to bury the dead since ancient times due to hygienic reasons and out of the fear of the unknown. Judaism, Christianity, and Islam upheld this custom. Though there are differences among religions regarding the nature and the condition of the tomb and how the corpse is positioned, the common goal is to make the corpse invisible. In Islam, the corpse is positioned to face the *Ka'bah* in Mecca toward which Muslims turn for five daily prayers. Muslims often write the words “*Huwa'l-Baki*” on the gravestone in Arabic meaning “only God is eternal” like Christians write “Rest in Peace.”

According to Islam, the tomb is a window to the hereafter. Muslims are strongly recommended to visit cemeteries to say supplicatory prayers for the soul of the dead and also remember death, though one may send supplicatory prayers afar. The first chapter of the Qur'an, which is only seven verses, is the favorite supplicatory prayer. One who visits a cemetery is supposed to say words of greeting in Arabic like “*salam alaikum*” (may peace be upon you), believing that the dead

hears the greeting person. All these beliefs and rituals allow the feeling of contact with the deceased, and this contributes much to the psychological well-being of the bereaved.

Islamic Funeral

The Islamic funeral has two parts. In the first part, the dead is brought to the mosque yard for the funeral service, and a prayer called “*salat al-janaiz*” (funeral prayer) is performed followed by a speech by the Imam (one who leads prayer) about death and the hereafter as well as paying tribute to the dead. Perhaps the most interesting moment of the funeral at the mosque is that the Imam asks the congregation and the kin whether they bear witness that she/he was a good person as well as requests them to forgive the deceased for his/her unjust acts to them. Muslim society attaches great importance to funeral prayer, and all these rituals allow the congregation psychological satisfaction for fulfilling their final duty to the deceased. In the second part, the dead is taken to the graveyard for the burial ceremony. During burial, some chapters from the Qur’an are recited both by the Imam and friends or relatives. Right after the burial ceremony, a ritual called “*talqin*,” which is inculcation of the articles of the Muslim faith to the dead, is performed by the Imam. In this ritual, the Imam speaks up to make the dead ready to answer the questions of the angels of interrogation. According to the Islamic creed, the dead is interrogated by angels in the grave. The sinful fails and the virtuous succeeds. The former is punished while the latter is rewarded. A saying of Prophet Muhammad goes: “The tomb is either a garden of paradise, or a trench of hell” (al-Ajluni 1932, Vol. II: 90).

Cemetery Visiting

Cemetery visiting is so vivid in the Islamic world that one may witness a huge crowd on religious festivals, on the eve of the fasting or sacrifice festivals in particular. This visit on the eve of the festivals has a psychosocial meaning as well. On

the days of religious festivals, younger ones visit parents and elder relatives among others to show respect. By visiting the cemeteries on the eve of the festivals, one includes the deceased ancestors. One who visits the grave of one’s friends or kin feels relieved by offering prayer and thinks that his/her prayers are to free the deceased from spiritual punishment.

Muslims are strongly recommended to keep cemeteries clean and tidy. A story of Prophet Muhammad sets an example in this regard. Right after a burial ceremony, the Prophet tidied up a stone surrounding the tomb. One companion asked why he had done that, saying that it had not been a damage to the corpse. The Prophet answered saying, “Though it is not a damage for the corpse, it is a damage for the onlookers” (al-Sharani 1954, Vol. I: 142–143).

 CA, USA

In India one of the accepted divine symbols is of a dark woman, nude, with flowing hair, four-armed, with two hands in the act of blessing and two

holding a knife and bleeding head, garlanded with a necklace of skulls, dancing with protruding tongue on the prostrate figure of a man. Frightening as she may seem, she calls our attention. Sister Nivedita says:

Whether we know it or not, we belong to her. We are her children, playing round her knees. Life is but a game of hide and seek with her, and if we chance to touch her feet, who can measure the shock of the divine energy that enters into us? Deep in our hearts is rooted the assurance that the moment will come – her mystic name will fall upon our ears. (Nivedita 1950, p. 20)

Kali Ma. How is it that an image so fierce can invoke the energy of the Mother? How is it that an image so fierce can evoke the energy of the mystic? Is her appearance to be taken at face value – is she a warrior goddess from the matriarchal tribal cultures of India? Or should her iconography be viewed more symbolically? Black because as all colors disappear in black, all names and forms disappear in her? Free from illusion in her primordial nakedness, is the severed head she holds indicative of the annihilation of ego-bound evil force? (Mookerjee 1988, p. 62).

How should we interpret her demon-destroying stories in the sacred scriptures of India – the Vedas and Puranas? For example, in the *Devi Mahatmya* she jumps out of the forehead of the Goddess Durga to fight the demons on earth that are out of control (Kumar 1981, pp. 30–31). In the *Mahabharata* Kali rises again when a demon king won't take no for an answer to his marriage proposal and sends his forces to subdue the Goddess in Her beautiful form as Gauri. She becomes so angry that out of her brow springs Kali, gaunt of body and red-eyed, with tiger skin, and garland of skulls, ready to assist with sword, noose, and club. Because the demons can reproduce when a drop of their blood is spilled, Kali must get creative. She throws the demons into her mouth and laps up their blood to destroy them! (Kumar 1981, p. 53).

Are these stories about the archaic female-centered South Asian matriarchal cultures resisting takeover by invading patriarchal male-centered Aryan cultures? After all, in medieval

Shakta traditions Kali was considered to be a direct descendant of the early Mother Goddess cult of the matriarchal agricultural peoples that are still present in India today (Payne 1997, p. 69). Or are they illustrating for us that there are times in the history of the planet when only female warrior energy can defeat the demons of war, greed, and oppression? Or shall we return to Kali as symbol and imagine that these stories about Kali defeating demons are really about Her ability to subdue our own inner demons with splendor? Is working with Ma Kali then really about working with our shadow?

And what does her role as an independent, sexual goddess have to teach us? In the Tantric *Mahavidya* (Wisdom Goddess) tradition, Kali is noted as primary. Her characteristics include her dominant position over her consort (Shiva) and her strong sexual appetite. Free from social and ethical roles – Kali is a breaker of boundaries and social models and dwells outside the confines of normal society (Kinsley 1997, p. 80). Though not many Indian women would take Kali as a role model, when Westerners consider her, what impact does her power, her focused use of anger, and her sexually liberating nature have upon us? What archetypal energy does She release within us? The answer takes us closer to center.

Behind the surface of this powerful death-dealing Goddess we find an all-encompassing loving energy: virgin creator, sustaining mother, and absorber of all. Many of her Hindu devotees in fact approach her as Mother. Is this because in India it is acceptable for a mother to be so fierce? Yes. However, it is also because the Indian perspective is not so dualistic as Western thought. This is why She can be seen in the Hindu tradition as the All: Cosmic Creatrix, World Mother, and Warrior Goddess supreme.

As She also appears as a force of nature, and the energy coiled in the chakra at the base of our spine, Kali's multivalent nature continues to reveal. As Kundalini, Kali is said to be part of the "Great Mother" energy "out of whose womb the universe emerges as a continuous unfolding of the immanent All" (Scott 1983, p. 24). She is responsible for maintaining the harmonious

balance of force fields within the earth itself – life fields, thought fields, and surface energy lines (Scott 1983, p. 106). Such primal identification suggests an ancient energy, a goddess sourced deep in the collective human soul.

Western writers in the area of women and religion offer more guidance for understanding this Goddess. They remind us that in order to discover what the story of a deity from another culture has to teach the reader, it is important to engage Her mythology, Her psychological ramifications, and the reader's own dreams and life experience. Through "myth-mirrors" like the Goddess, the reader can experience a new frame for their life experience and existential longings (Gross 1996, pp. 232–233).

For Western feminists, Dark Goddesses like Kali are said to be the primordial goddess from which everything emerges and to whom all returns – the nurturing Earth Mother who brings forth all life, as well as the destructive power of death. A goddess of death and transformation, of transition and renewal, the Dark Goddess is said to contain all contradictions within Herself. The call of this goddess can be heard in the deep, serious, will-to-live rising from within the body of the planet. Pushing through us for healing and realignment with nature, it is only our willingness to face the Dark within ourselves that will liberate us in the end (Noble 1991, p. 7).

Interaction with Kali energy is also an attempt to recover divine imagery more compatible with the reality of female power, anger, and assertion in western consciousness. Kali's reminder of the Earth Mother's power of rage readied for action, poised against the backdrop of a plundered and wounded planet, is a vision of spiritually energizing female power far removed from the benevolent mercy and accepting patience of most Christian female images! (McDermott 1996, p. 289).

Kali in fact ends up challenging all social norms for women. As demon slayer, Mother Goddess but without children, wife of Shiva but rarely with him (the dominating one in the relationship and the initiating partner in the cosmic dance) – living outdoors and in the cremation grounds – Kali is in the active, powerful role. She excels in

all the male domains. By not conforming to the established role of women in Hinduism or in any other culture informed by monotheistic traditions, she reverses and upends the patriarchal order (Gupta 1998, p. 31).

Seen inwardly, the Dark Mother in archetypal western psychological terms is viewed as "a place of magic, transformation and rebirth, that which is secret, hidden, dark; the abyss. . . ." (Starck and Stern 1993, p. 5). On the personal level Kali plays a strong, healing psychological role in the lives of women as they come to accept the parts of themselves that have been repressed and feared. On the collective level, Her transformation of western women's painfully fragmented collective consciousness helps undo the domineering monotheistic patriarchal perspective (McDermott 1996, p. 291).

Jungians say that great resolve is needed to enter into this shadow dance – the darkness of one's own chaos. But as we do, the power of the root chakra rises, and it becomes the undulating wave of the supreme Dark Goddess, the Kundalini. Creativity and freedom that women seek do not lie in the patriarchal path of control. Rather, they lie in letting go and descending into the chaos of the maternal matrix. We are invited to participate – to yield to the frenzied beat of the mother's dance (Woodman and Dickson 1997, p. 179).

In Jungian thinking, it is said that the activation of an archetypal energy releases great power. As women access the Dark Goddess archetype – Mother, Warrior, and Cosmic Creatrix – as Her energy rises from body, psyche, and spirit, its effects are felt in all worlds. Our rage, our battle cry for change, our independence, and our open hearts – the Dark Goddess can hold it all. Women and men – hold on for the archetypal rising of the Dark Goddess Kali Ma into our psyches, our spirits, our age! (Woodman and Dickson 1997 p. 223).

Karma

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Karma is a core doctrine to Indian spirituality and has a similar meaning in both Hindu and Buddhist thought. It represents the idea of universal justice, the belief that in the end, good will be rewarded and wrong doing punished. Karma is an impersonal force operating to meet out consequences of actions. It is in contrast to the views of the Western Abrahamic religions (Judaism, Christianity and Islam) where a personal God judges individual souls at the end of time and assigns rewards or

punishments according to one's deeds in life. Karma is automatic and not a judgment of one's conduct but merely a consequence arising out of action. It is often spoken of as the law of return, that whatever you put out toward others in conduct will come back eventually. Unlike the Western monotheism which posits only one life for each individual, in Eastern traditions the individual has an entire series of lifetimes in which to improve their spiritual and ethical development. The wheel of existence in both Hindu and Buddhist thought is a series of births, lives, and deaths over endless eons. The individual soul or karmic core gets passed along through successive incarnations until spiritual development leads to final unification with the transcendent ground of Being. In Hinduism this is viewed as Brahman, and in Buddhism, this is simply termed enlightenment, or the fully awakened state. Karma has become a popular term in New Age spirituality; all actions can be good or bad karma, depending on their ethical quality.

Kierkegaard, Søren

Tadd Ruetenik

St. Ambrose University, Davenport, IA, USA

Danish theologian Søren Kierkegaard is often referred to as the father of existentialism, and not the father of depth psychology. His 1849 book *The Sickness unto Death*, however, is an

exposition of human consciousness that is comparable to the work of Freud in important respects. Both Kierkegaard and Freud stressed the relative impotence of the ego in relation to nonrational forces in the mind, and both attempted to provide a remedy for this precarious condition. What makes Kierkegaard's work in depth psychology unique is its explicitly Christian focus. *Sickness* is marked with the subtitle *A Christian Psychological Exposition for Edification and Awakening* and provides a detailed account of the disease of despair, which is understood as Godlessness. Another of Kierkegaard's works, *Fear and Trembling*, takes the Genesis story of Abraham's attempted sacrifice of Isaac and provides a beautiful depiction of psychological endurance in the face of absurdity. It, like *Sickness*, operates on the belief that human existence is fundamentally paradoxical. For Kierkegaard, to be human is to be in a permanent state of cognitive dissonance and on the verge of losing one's mind. To be saved, one must accept the dissonance and lose one's mind for the sake of gaining faith in God.

Despair and Human Existence

Human existence involves an uncomfortable synthesis of the eternal and temporal, and because of this all human beings are in despair, whether they admit it or not. Commonly, people believe that despair comes from fearing death and brooding about the temporality of their existence. But according to the Christian perspective presented in *Sickness unto Death*, despair comes not from consideration of death and temporality but from consideration of one's inability to die. Like a man on his deathbed, whose finite body writhes in pain but who is not yet granted the freedom of death, the Christian lives with the understanding that in the face of despair, death is actually the last refuge. Death is the goal, but it is an unreachable one. A Christian's blessedness, that which sets her apart from all others, is her consciousness of an eternal self. Paradoxically, this consciousness is the sickness unto death.

People make impotent attempts to avoid this fundamental paradox by constructing false

personalities that deal with their condition by either rebelling against it or weakly resigning themselves to it. To avoid either of these types of folly, one must have faith, namely, the faith that with God, all things are possible. Kierkegaard likens this faith to the act of drawing a satisfying breath after a period of stifling anxiety. With God, one can breathe again, and the panic disorder of infinitude is cured.

Kierkegaard was a man beset by anxiety and depression throughout his short life and surely intended *Sickness Unto Death* to be, as much as anything else, a guide for other sufferers. Kierkegaard (who is as usual speaking through a pseudonym in this work) advocates that one must abandon the laborious process of trying to create a false personality. There is a greater control that takes over when one is brave enough to give up the ego's precarious tyranny.

Despair and Faith

Kierkegaard's *Fear and Trembling* provides another detailed explanation of the process of losing one's mind to find God. The inspiration for this story is the biblical account of Abraham's attempted sacrifice of his son. The book is especially sympathetic to the anxiety that Abraham must have felt while going up the mountain, following God-given orders that are, on any honest appraisal, ethically abominable. The faith that guides Abraham through the trip is impossible to explain and lends itself only to poems of admiration.

Abraham's faith is, after all, a monstrous contradiction. It is not merely an example of temporary cognitive dissonance to be overcome by intellectual growth but an absolute paradox, inaccessible to thought. One cannot appreciate the story without seriously considering whether Abraham is simply a murderer, one who is killing not only his own future but also that of his people. Abraham maintains the infinitely optimistic and absurd belief that by losing his son and his people, he would get them both back. Such a belief is rationally unwarranted and yet, according to *Fear and Trembling*, is the requirement for faith.

Kingdom of God

Marta Green
New York, NY, USA
Mercury Pier Publishing, Hong Kong Special
Administrative Region of the People's Republic
of China, North Point, Hong Kong

The concept of the Kingdom of God was first written about in Exodus.1; a hymn celebrating the crossing of the Red Sea and proclaiming in verse 18 "The Lord will reign for ever and ever" (Jewish Encyclopedia). The concept was later developed by the prophets, especially Isaiah and Jeremiah, and expressed the yearning of the long-oppressed Jewish people for the rule of their God over all the nations.

The Kingdom of God was the central concern of Jesus' ministry. Mark 1:14–15 records the first words of his preaching ministry: "The time is fulfilled, and the kingdom of God is at hand: repent and believe in the gospel." There is a disagreement among scholars as to what Kingdom Jesus was preaching. Some possibilities:

1. The dramatic intervention by God in the affairs of humans as depicted in the Synoptic Gospels

(Luke 17 and parallels) and the *Book of Revelations*. This vision would point to a psychology of fear, a preoccupation with the division of the saved from the damned, a focus on imminently future events over which one has no control. Individuals who subscribe to such a belief system would be unlikely to seek treatment as any problem would be seen through the screen of Biblical apocalyptic prophesy.

2. The return of an earthly king like David. Jesus' disciples certainly understood the Kingdom in this way (Matthew 20:21). Those who understand the Kingdom of God in this way would work to establish a theocracy here on earth. Their focus would be on establishing right action within such a Kingdom and right action to bring such a Kingdom into existence. Illness and emotional problems would be read as a result of failing to follow prescribed moral codes.
3. The peaceable Kingdom, a place as in Isaiah where peace extends even to the natural world, where war will be no more and all the nations will flow towards the Holy Mountain (Jerusalem).

The wolf shall live with the lamb,
the leopard shall lie down with the kid,
the calf and the lion and the fatling together,
and a little child shall lead them.

⁷The cow and the bear shall graze,
their young shall lie down together;
and the lion shall eat straw like the ox.

⁸The nursing child shall play over the hole of the asp,
and the weaned child shall put its hand on the adder's den.

⁹They will not hurt or destroy
on all my holy mountain;
for the earth will be full of the knowledge of the Lord
as the waters cover the sea (Isaiah 11: 6–9).

4. Even though most of Jesus' preaching was on the Kingdom of God, he does not specifically define what the Kingdom is, thus leaving the exact nature of the Kingdom open to interpretation. For instance, the Kingdom can be interpreted as current or future reality and an inner or outer reality, an individual or group reality or all of these, leading to a tension between/among these opposites. An example

of this is Luke 17:21 “The Kingdom is within you,” which can also be read as “The Kingdom is among you.”

The Kingdom of God is mentioned 58 times in Matthew, Mark, and Luke, and there are 31 references to the Kingdom of Heaven in Matthew. Most are passages about proclaiming the arrival of the Kingdom or more frequently worded that the Kingdom has “come near.” There are many references to entering, seeing, and receiving the Kingdom which seem to suggest that entry is an individual decision and dependent on individual behavior, for instance, the parable of the rich man seeking to enter the Kingdom in Matthew 19:24. There are other references to the Kingdom being a secret as in Mark 4:11 and Luke 8:10 and references to “selling all” for the Kingdom (Matthew 13:14–46).

The Gospel of Matthew alone uses the introduction “The Kingdom is like” to begin longer parables such as the workers in the vineyard and the great banquet, though the longer parables in other Gospels are probably references to the Kingdom even if not actually specified as such. Such parables do not equate the Kingdom with one aspect of the story, say the banquet, but with the whole process of inviting and eating and even kicking out the man without a wedding garment (Matthew 22:2–14).

There is a small collection of similes which appear to give insight into Jesus’ conception of the kingdom of God. The Kingdom of God is like a mustard seed, putting yeast in flour, and planting seeds, a small common object of no special value which when hidden transforms the whole.

Psychotherapy also utilizes this principle. Psychotherapists align with the inborn aliveness in their patients, aliveness that may be difficult to notice with patients who are especially suppressed or injured. The therapist spots the tiny seed of initiative hidden inside and helps the client make room for it to enlarge and transform the whole personality.

In the parable of the seed growing of itself (Mark 4:26–29), Jesus suggests that the Kingdom of God is a natural process of coming to fulfillment and wholeness navigated through the

opposites of day and night, sleep and rising, and man and earth, “first the blade, then the ear, then the full grain in the ear.” As members of the natural world, we as humans are imbedded with a natural growth towards wholeness and fulfillment, born from within. Psychotherapy is a practice that seeks to discover and enhance this process of finding wholeness. Some Biblical scholars may equate this process with the coming to life of the Kingdom of God.

Klein, Melanie

Pamela Cooper-White
Union Theological Seminary, New York,
NY, USA

Melanie Klein (1882–1960) was born in Vienna, Austria, the youngest of four children, to Moriz Reizes, a medical doctor, and Libussa Deutsch, his young second wife. Moriz was born into an Orthodox Jewish family and was intended by his parents to study for the rabbinate, but he rebelled and attended medical school. Melanie was close to her strong, domineering mother, but emulated her emotionally remote and intellectual father. A brilliant and unorthodox first-generation psychoanalyst, she rose to become one of the foremost theorists and practitioners of her time and is credited with founding the “object relations” school of psychoanalysis. At the same time, her personal life was shadowed by loss and tragedy,

and it is perhaps no coincidence that much of her writings focused on themes of depression and manic depression, psychic splitting, the death instinct, envy, and reparation.

Melanie's life was marked by a series of tragic and traumatic losses – the death of her beloved older sister Sidonie from tuberculosis when Melanie was just 4 years old, the death of her father one week after her 18th birthday, and then the death of her older brother Emmanuel of heart failure when she was 20. At age 17, Melanie had met and almost immediately become engaged to Emmanuel's friend Arthur Stevan Klein, an industrial chemist and her second cousin. Still mourning her brother, she married Arthur the day after her 21st birthday in 1903. The couple traveled a great deal for Arthur's work, keeping Melanie from pursuing further education in her chosen field of medicine, and the marriage was not happy. Melanie suffered several bouts of depression, especially during her pregnancies. Her daughter Melitta was born in 1904, followed by Hans in 1907, and Erich in 1914. The couple separated in 1919, and finally divorced in 1924, after a custody battle over Erich (who eventually lived with his father in Berlin). Hans died in 1924 in a mountain climbing accident which Melitta, among others, considered to be a suicide.

Klein never completed medical school. However, after moving with Arthur to Budapest during World War I, she entered analysis in 1910 with Sandor Ferenczi, a rising star in Freud's circle at the time. There she found both close friends and the intellectual stimulation she had craved. She began analyzing children – including her own. She met Freud in 1918 at a meeting between the Austrian and Hungarian analytic societies and became doubly determined to train as an analyst (Grosskurth 1986, p. 71). A year later, Klein made a strong positive impression with her first analytic paper entitled "The Development of a Child" (an account of her analysis of Erich) and was admitted to the Budapest Psychoanalytic Society. After separating from Arthur and moving to Slovakia with her children, she was persuaded by Karl Abraham, another intimate of Freud's, to move to Berlin to pursue analytic training. She entered analysis with him in 1922 and started her own practice with both child and adult patients.

Her analysis was abruptly cut short by Abraham's death a little over a year later – another traumatic loss – but she continued a self-analysis along the same lines for many years. Klein's ideas were not popular among the Vienna analysts; however, she gained support from the British analytic community. In 1925, Ernest Jones, a London analyst and Freud's first official biographer, heard her present a paper on child analysis at a conference in Salzburg in 1925. He invited her to present a series of papers to the British Psychoanalytic Society, an invitation she happily accepted. These lectures were subsequently published as her first book (Klein 1984). Other important British supporters included Joan Riviere, Alix Strachey, and Susan Isaacs, all influential women analysts.

In 1925, she fell in love with a married journalist, Chezekel Zvi Kloetzel, but in 1926 she broke off their affair and moved to London permanently. She became the leading theorist in the British Psychoanalytical Society and is known as the founder of the school of theory known as "object relations." She trained many other important analysts in the generation after Freud, including D.W. Winnicott, Wilfred Bion, and Hanna Segal. John Bowlby, founder of "attachment theory" was also closely influenced by Klein. Klein's daughter Melitta became a medically trained psychoanalyst in her own right and was married in 1924 to another psychoanalyst and friend of Freud's, Dr. Walter Schmideberg. In 1928 the Schmidebergs also moved to London, escaping an atmosphere of increasing anti-Semitism in Germany and Austria. Melanie Klein remained in London as an influential analyst and teacher for the rest of her life. She died in 1960, due to complications after surgery for colon cancer.

A famous conflict erupted between Klein and Freud's daughter Anna after the Freud family emigrated to London in 1938 to escape the Nazis, and especially after the 1939 death of Freud, whom both women revered. It was one of many schisms within Freud's inner circle throughout his career and one that resembled an oedipal struggle (although between two powerful and influential women) over who was the true heir. Before World War II broke out, numerous conflicts and rivalries had already begun to emerge between Vienna and London, including a harsh

critique in 1927 of Anna Freud's work by Klein. Both Melanie and Anna were lay analysts (nonphysicians) who worked with children. However, Anna believed that children were too young to be analyzed, preferring a psychoeducational approach to bolster the ego's adaptation to reality, while Melanie had established a method of analysis even with very young children, asserting that children produced symbolic material in their play that could be analyzed from a very young age (Segal 1979). Both women had strong claims. Anna was, of course, Freud's daughter and close companion, and had become a teacher and then Director of the Vienna Psychoanalytic Training Institute, and Secretary of the International Psychoanalytical Association.

To compound the difficulties, Klein's own daughter Melitta publicly joined the ranks of the opposition (which included Melitta's own analysts, Ella Sharpe and Edward Glover). Melitta openly criticized her mother's techniques (e.g., a paper attacking Klein in 1937), and they remained estranged for the rest of Klein's life. Melitta eventually separated from her husband and emigrated to New York, where she contributed to the classical Freudian orientation of American psychoanalysis in the 1960s and beyond. She did not attend her mother's funeral. As a result of increasingly personal attacks between the two sides in London, culminating in the "Controversial Discussions" in the 1940s, the British Psychoanalytical Society divided permanently into three separate training divisions: Anna Freudians (later called "Contemporary Freudian"), Kleinians, and the Middle Group (later called "Independent") – although to its credit, the British Society, unlike many other psychoanalytic institutes, never divided into completely separate entities. These three branches of British psychoanalysis continue today.

Klein's contributions to psychoanalysis were pathbreaking, and because of their often speculative quality, were also frequently controversial. Although she insisted that she was a true follower of Freud in psychoanalysis, her theory made a major shift in the conceptualization of the primary motivation of human personality from Freud's focus on the drives of sex/libido and aggression. Her own model of personality emphasized an infant's need to connect with others or "objects"

(the converse of the subject, the "I"), which existed as mental representations in both the inner (psychic) world and the outer world (real, but filtered through the child's perceptions). Klein's central proposition was that infants unconsciously internalize their primary caretakers and other early figures into their psyches. These "internal objects" continue to live on, unconsciously and quasi-independently, for the rest of the individual's life, shaping the personality. At first, these fantasized objects may be in the form of parts of the parent, such as the mother's breast, which may be experienced through the child's perceptions as (a) good and nurturing, (b) bad and withholding and therefore to be destroyed by biting or scratching, or (c) even overwhelmingly too good and to be spoiled out of envy.

Derived from her clinical work with both adult and child patients, she also speculated about a much earlier passage through Freud's "anal," "oral," and "genital" developmental stages, assigning an early oedipal stage to about 6 months of age. Klein further distinguished two "positions" in earliest childhood (distinct from chronological stages, because they can oscillate). The most "primitive" is the "paranoid-schizoid position," in which the child's psyche must split off into the unconscious the negative experiences of the parent on whom she/he depends and idealize the "good parent." Thus, the child defends against being utterly at the mercy of the "bad parent." The second, healthier or more mature position is what Klein termed "the depressive position," in which the child is able to hold together experiences of the parent as both "good" and "bad" in an acceptance of the tragic reality that perfection is not possible. The child is aided in achieving the depressive position in part by recognizing his or her own destructiveness, and through guilt for desiring to devour and thus destroy the breast, she/he is able to reach the desire for reparation. Klein thus construes guilt, in contrast to Freud's theory, not as a disabling source of neurosis based on the oedipal stage (around age 5), but as the stimulus for healing internal psychic splitting in early infancy.

The emphasis in Klein's theory was always on the unconscious internal world of the child (especially the "preoedipal child," i.e., the infant

and toddler) and by extension also the adult. Fantasy (or “phantasy” in her terminology) was primary for Klein, and actual environmental contributions to the development of the personality and the genesis of pathology were secondary to the infant’s inner perceptions (and distortions) of his or her own desires and anxieties, which were then projected onto the external world. Because of this theoretical bent, Klein was also more open to analyzing patients with psychotic tendencies, unlike Freud who viewed psychoanalysis as appropriate only for neurotic patients.

Projection, the psychic defense by which an individual assigns his or her own internal states onto someone in the outer world, was already identified by Freud. Klein extended this in 1946 in a famous paper entitled “Notes on Some Schizoid Mechanisms” (Klein 1975b, pp. 1–25) to include the concept of “projective identification,” whereby a person’s unconscious joins in unconscious interplay with another person’s and invokes feelings and reactions in that other person without conscious stimulation. Projection and projective identification generally erupt from the paranoid-schizoid position, as the role of “good” and “bad” is psychically tossed like a hot potato between himself/herself and others with whom he/she relates. This can result in idealization of the other and denigration of the self or, in its opposite form, viewing the other as a perpetrator and oneself as an innocent victim – with frequent oscillation between two all-or-nothing perspectives. In therapy, this phenomenon is often experienced in the transference-countertransference dynamic between therapist and patient, and by examining his or her responses along multiple registers (thoughts, feelings, bodily sensations, fantasies, dreams), the therapist may come to understand the patient’s experience more fully than through conscious dialogue alone.

The significance of Klein’s work for the psychology of religion is indirect. A self-avowed Freudian, she did not adhere to any religion in her professional adult years, nor did her writings directly address religion. However, Melanie and

her family suffered from the rampant anti-Semitism in Austria and Germany leading up to the Holocaust, and Melanie’s student and early biographer Hanna Segal reported that Melanie was critical of Jews who denied their heritage (Segal 1979) and believed that parents should pass on their religious traditions to their children. One of the first “Kleinians,” Wilfred Bion, extended Klein’s theories to develop a model of symbols for consciousness and unconsciousness – “K” for knowing, or rational thought and “-K” for “attacks on knowing” or irrational thought; alpha and beta for conscious vs. unthinkable thoughts, and of particular interest for psychology and religion, the letter “O” for the ineffable, or ultimate Truth. Winnicott further developed object relations theory as a more fully relational paradigm (both unconscious and conscious). His concept of a psychological “potential space” of both “me and not-me” paradox, play and creativity (initially occurring between a mother and her infant), has been utilized by a several of pastoral theologians and psychologists of religion, including James W. Jones (1993), Brian Grant (2001), and Pamela Cooper-White (2007). From within the field of psychoanalysis, Michael Eigen (1998) has similarly observed an “area of faith” and a “psychoanalytic mysticism” in the writings of Bion and Winnicott, among others. Another analyst, Ana-Maria Rizzuto (1981), drew on the concepts of internal objects and projection to investigate how individuals form God images from early childhood experiences; subsequent studies by pastoral theologians have expanded the clinical utility of understanding children’s and adult patients’ conceptions of God as indicators of the texture and dynamics of their earliest object relations.

Koan

Paul C. Cooper
National Psychological Association for
Psychoanalysis, Two Rivers Zen Community,
New York, NY, USA

Introduction

The term “koan” derives from the Chinese *ko* (public) *an* (case), hence, literally, “public case.” A public case implies a standard of judgment. In the case of Zen, the judgment refers to the depth of the student’s intuitive understanding. Each koan takes the form of a story, anecdote, or dialog, typically entailing an incident, situation, or conversation between an historical Zen figure and a student. The use of the koan exercise as a tool for spiritual practice developed in tenth- and eleventh-century China. Koan practice instilled new life into a Zen system that had become codified, calcified, dogmatic, and caught up in sectarian disputes.

Koan study developed through a long history of spontaneous question and answer dialogs, in which the question is typically turned back on the student or is given a seemingly illogical response. As teaching stories were collected, formalized, and compiled into anthologies and structured, formal courses of study developed that were intended to simulate and to engender enlightenment experiences in Zen students.

Koan study and practice has developed differently within the Rinzaï and the Soto Zen sects. These different approaches have been described as “instrumental” and “realizational.” According to the Zen scholar Hee-jin Kim, Dogen, the

founder of the Soto sect emphasizes a realizational approach, but he does not necessarily abandon the instrumental approach that characterizes the D. T. Suzuki presentation of the Rinzai school emphasis on koans as a pedagogical means to the end of attaining enlightenment.

Practice

After a preliminary period of practice, in the Rinzai tradition, Zen students are given a koan to focus on during periods of zazen (sitting meditation) as the subject of presentation, scrutiny, and discussion during face-to-face interviews and group talks conducted by the Zen teacher. The Zen koan needs to be taken as a matter of life and death by the student. For example, in his commentary to the Mumonkan (Gateless Barrier), an important twelfth-century koan collection, Mumon, the compiler, conveys the sense of urgency and the intense level of energy applied to this task of concentration by comparing the internalizing of *Mu* (no) to “swallowing a red-hot iron ball” (Aitken 1991, p. 9).

The student’s response to any koan reflects deepening or penetrating levels of awareness of reality as a result of cutting through or short-circuiting logical, linear thought. However, as Taizan Maezumi notes, the koan.

... is much more than a paradoxical riddle designed to prod the mind into intuitive insight. The koan is quite literally a touchstone of reality. It records an instance in which a key issue of practice and realization is presented and examined by experience rather than by discursive or linear logic (Yamada 1979, p. vii).

This experientially based insight is referred to by Zennists as *satori* (enlightenment). Accordingly, the Zen master can only witness the student’s level of mastery through presentation during private interviews, but does not teach the student anything.

In practice, koan study engenders a spontaneous, intuitive knowledge beyond teachings and scriptures. This spontaneous direct knowing is reflected in the contemporary American Zen Master, John Loori’s comment that “We *do* koans, we don’t talk about them” (1994, p. xvii). Koans are designed to defeat rational, linear cause and effect thinking, and for this reason, they frequently

appear irrational and meaningless. D. T. Suzuki comments: “For the koan is not a logical proposition but an expression of a certain mental state resulting from Zen discipline” (1994, p. 83).

Similar to the psychoanalytic dialog, both the Zen master and the psychoanalyst are ever on the alert for dialog that deteriorates into intellectualism or logical philosophical discourse. With different goals in mind, and while not disregarding the intellect, both koan practice and psychoanalysis endeavor to go beyond its limitations and break through to a lived and felt awareness.

Stephan Heine writes that “The Zen koan ... defines the heart of Zen Buddhism and is the single most distinctive feature in the thought and practice of the Zen sect” (2002, p. 1). Why does Zen ascribe such a central place to the koan? As a religion, Zen holds a salvational function. For Zen, the salvational function is articulated in the notion of *satori*. The koan and the associated dialog function to facilitate the *satori* experience. It is from this salvational standpoint that, as Suzuki notes, “... the koan exercise came to be recognized as the necessary step towards realization of *satori* in Zen Buddhism” (1994, p. 31).

Koan Study and Psychoanalysis

Considering the centrality of the koan in Zen practice along with the increasingly deepening interest in the relation between Buddhism and psychotherapy, it is surprising that there is virtually no discussion of koan study in relation to psychotherapy in the literature on Zen and psychotherapy. At present, no systematic study of the relationship between koan work and psychoanalysis exists with the exception of a brief reference in Erich Fromm’s classic *Zen Buddhism and Psychoanalysis* (Fromm et al. 1960). Fromm noted that both psychoanalysis and Zen practice function to make the unconscious conscious.

In examining the relationship with the teacher and the descriptive aspects of *satori*, we can observe a number of significant connections to psychoanalysis. For instance, *satori* is expressed in freedom, creativity, and in the arts. Koan practice involves relational dynamics that evolve over time and that parallel psychotherapeutic

techniques and aims in certain fundamental ways. Some of the noted shifts in relational dynamics include a movement from contrivance to spontaneity, dogmatism to an iconoclastic orientation; from an over-reliance on intellectualization to expanded emotional expressivity; and from a defensive false self expression to the authenticity of true self experiencing. Donald Winnicott describes the expression of the latter as “the spontaneous gesture” (Winnicott 1965, p. 148). He characterizes the spontaneous gesture as reflective of the True Self expression in action. He writes that “Only the True Self can be creative and only the True Self can feel real” (1965, p. 148). While he does not make a specific reference to Zen or to koan study, he makes the observation that connects his psychoanalytic concept of “True and False Self” to religious experience. He writes that “This concept is not in itself new. It appears in various guises in descriptive psychiatry and notably in certain religions and philosophical systems” (Winnicott 1965, p. 140).

This movement from contrivance to spontaneous authenticity is crucial to psychoanalysis. For instance, Wilfred Bion notes that “There can be no genuine outcome that is based on falsity” (1970, p. 28). The implication for treatment centers on the analyst’s capacity for authenticity. Bion writes that “the more real the psychoanalyst is, the more he can be at one with the reality of the patient” (Bion 1970, p. 28). The idea with both Zen practice and psychoanalysis conducted from this perspective is that psychotherapy relies less on preconceived thoughts, beliefs, and ideas and more on intuition of the moment-to-moment experience.

A common feature of both systems is a notable movement in the dialog from observation to experiencing that closes the gap between objective and subjective self. Parallels can also be noted between koan dialogs and Bion’s notion of bridging the gap between an activity that is “about psychoanalysis” and “being psychoanalysis.” Cooper (2001) provides a detailed discussion of the gap between being and knowing in relation to Zen and psychoanalysis. Lived experienced truth replaces the accumulation of information, intuitive knowing (prajna) replaces conceptual understanding, and unitive experiencing replaces dualistic thinking. Truth experiencing is prioritized both in Zen and

in Bion’s psychoanalysis. A parallel can be drawn here to Bion’s notion of intuition. In expressing the truths of Zen, we become more truthful because we are basically expressing the truth of who we authentically are. As this expression becomes increasingly fresh, alive, spontaneous, and authentic, we expand our capacity, as Bion notes, with respect to psychoanalysis, that is, free from memory, desire, and understanding, and we experience and express a wider range of emotions. What is required of the psychoanalyst is an interpretation that is enlivening, not deadening.

The explicit iconoclastic orientation as articulated in the koan literature coupled with the Zen experiential negation of an inherently existing self or essence and the deconstruction of reified versions of self and object experience resituates the psychotherapist who practices Zen in relation to the therapeutic encounter and radically alters the conception of goals and healing in psychoanalysis. Similarly, for a minority of influential psychoanalysts such as Bion, Lacan, and Eigen, truth lies beyond the parameters of any notion of goal, pathology, or healing. For instance, for Bion, the notion of cure operates as a function of desire and interferes with the lived experience of Truth and at-one-ment. For the Zennist, the notion of cure is a function of attachment and intellect and requires deconstruction. Lacan offers a similar vantage point. He observes that the analyst’s ego functioning should not be considered as an orientation point or as a clinical measure of the patient’s health, for normality or for objective reality.

As a result, Bion observes that “The pattern of analysis will change. . . . ‘Progress’ will be measured by the increased number and variety of moods, ideas and attitudes in any given session” (1967/1988, p. 18). Similarly, Suzuki describes a feeling of exaltation “. . . due to the fact that it is a breaking up of the restriction imposed on one as an individual being. . . an infinite expansion of the individual” (1994, p. 29). With this point in mind, the sixteenth-century Korean Zen master, T’ui - yin notes that.

“What is required of Zen devotees is to see into the phrase that liveth and not into one which is dead.” (Suzuki 1994, p. 92).

D. T. Suzuki describes koan study as “. . . a unique contribution Zen has made to the history

of religious consciousness” (1994, p. 11). He describes the development of koan study as crucial to the revitalization of Zen, which had, over time, become lifeless and calcified. He attributes this calcification to intellectualism and quietist tendencies. It is interesting to note the pervasive and perennial nature of these tendencies in contemporary psychotherapy. Suzuki notes that “. . . there was a tendency which made for the evaporation of Zen experience into conceptualism” (1994, p. 77). Steven Heine notes that during the thirteenth century, Dogen, the founder of the Japanese Soto sect of Zen Buddhism, revitalized koan study, which also had become lifeless. He accomplished this revitalization by criticizing the derailment of dialog in traditional koan study and by offering novel and contradictory interpretations of traditional koans that he intended to use in order to expand dialog.

One question that is relevant to contemporary psychotherapy is “Can koan practice and study enliven psychotherapy?”

Kohut, Heinz

Joenine E. Roberts

Association for Psychoanalytic Self Psychology,
Blanton-Peale Institute, New York, NY, USA

Heinz Kohut (1913–1981): Born in Vienna, Heinz Kohut emigrated to Chicago in 1939 where he trained in psychiatry at the University of Chicago. In 1946 he entered the Chicago Institute for Psychoanalysis where he would remain as a supervisor and training analyst for the rest of his life.

Kohut received wide recognition late in his life for the development of the theory of Self Psychology in which he replaced Freud’s drive theory with a focus on experience of self. According to his theory, narcissism had its own line of development. There could be no self without another; it was in relationship that the self was formed and developed. Hence, Kohut’s vision of treatment emphasized understanding the context of the patient’s reaction. For this, the analyst relied on a process Kohut called “empathy and vicarious introspection” in order to understand and explain the patient’s subjective experience within the treatment.

Kohut comprehensively outlined his theory in his 1968 paper “The Psychoanalytic Treatment of Narcissistic Personality Disorders: Outline of a Systematic Approach.” He said that the self is first sustained by archaic mergers with self-objects. The self then progresses towards more mature self-object experience and is sustained by empathic resonance in adult relationships. In self psychological treatment, the analyst and

remobilizes his or her unmet self-object needs through the self-object transference. Kohut recognized three lines of self-object transference: mirroring, idealization, and twinship, which engage the analysand's need for, respectively, self-esteem, self coherence, and human alikeness.

According to Strozier, Kohut believed that religion's unique function was to hold together, strengthen, and make harmonious man's self.

Krishna

Lee W. Bailey
Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Krishna (“dark one, dark blue”) was the eighth avatar (incarnation) of Vishnu, the major Hindu

deity who preserves and protects the world and comes to earth as *avatars* (incarnations) to help people. Krishna is multifaceted, a trickster, embodying divine love and joy, overcoming pain and evil, protecting cows, and bringing refined *moksha* – liberation from reincarnation. As a god-child, he was born to Devaki, and as a young (low-caste) cowherd, he played the flute for the cows, the other cowherds, and the young milkmaids. As a deity of humor, he teased the milkmaids, who adored him, even stealing their clothes when they were swimming. One moonlit night Krishna fulfilled the milkmaids' yearning for union with him, dancing with and delighting them, which sounds a bit like ancient Greek Dionysian religion. This became the theme of much love poetry and, more spiritually, represents the divine play and love between *Perusha* (soul) and *Prakriti* (primordial nature).

When Krishna was grown, the wicked king Kansa sent many demons to kill him, including the five-headed demon snake Kaliya. Krishna danced on his heads and defeated it so he would not poison the river Yamuna. Finally, he killed king Kansa. Krishna married Radha, who was foremost of the milkmaids and avatar of the goddess Lakshmi (wife of Vishnu). Some Indian women see their husbands as Krishna, and the husbands see their wives as Radha; thus, they see the divine Self in each other (*Santan*).

In contrast to the yoga of austerities or meditation, Krishna's *Bhakti* yoga is the worship through devotion to a particular god, such as Krishna, who is immensely popular in India, for he embraces a wide spectrum of psychological feelings, such as love, spiritual wisdom, and perception of Ultimate Reality. Krishna's popularity grew with the rise of the medieval *Bhakti* movement. *Bhakti* practices, such as chanting the names of deities, are a meritorious path to release from reincarnation and union with the Absolute (Ions 1967, p. 48). The chant “Hari Krishna” means “Holy Krishna.” (Fig. 1).

In the Bhagavad Gita (*Song of God*), a very popular Hindu text, Krishna teaches Arjuna many lessons. In battle Krishna rode in the chariot of Arjuna and taught the warrior the essence of Bhakti Yoga or the being yoked to the divine

Krishna, Fig. 1 Krishna Statue at the Sri Mariamman Temple (Singapore), courtesy of AngMoKio This figure is licensed under the Creative Commons Attribution-Share Alike 3.0 Unported (http://en.wikipedia.org/wiki/File:Sri_Mariamman_Temple_Singapore_2_amk.jpg)

through love and devotion. But first Arjuna resists killing his own kinsmen in the opposing army:

Krishna, Krishna, now as I look on these my kinsmen arrayed for battle ... my body trembles. ... What do I want with Victory, empire, or their enjoyment? ... Vice rots the remnant, defiling the women, and from their corruption comes mixing of castes. (*Song* I, p. 31–33)

These two good ethical objections Krishna must answer. First, he replies,

Even if you consider this from the standpoint of your own caste-duty, you ought not to hesitate, for, to a warrior, there is nothing nobler than a righteous war. ... it opens a door to heaven. (*Song*, II, p. 38)

The deeply embedded caste system of India that gives social order to its advocates seems to democratic thinkers only social barriers that religions should oppose. Indeed later Gandhi (1869–1948, of the *Vaishya*, merchant caste), when prodded by his son, who wanted to marry a *Brahman* (the highest priestly caste) girl, came to reject the caste system and thereafter would

only attend weddings of different castes (Fisher 1954, pp. 109–112). But here this ancient text (c. 200 BCE–200 CE) was not ready for democratic ideals.

Krishna here teaches to Arjuna to do his caste duty but remain detached from worldly affairs:

The truly wise mourn neither for the living nor for the dead. ... No one has the power to change the Changeless. Bodies are said to die, but That which possesses the body is eternal. It cannot limited, or destroyed. Therefore you must fight. (*Song* II, p. 36)

Krishna is referring to the Atman, the spark of the Infinite Brahman in each person, which is unborn, undying. “Do not grieve, he teaches, for: “Death is certain for the born. Rebirth is certain for the dead. You should not grieve for what is unavoidable” (*Song* II, p. 38). The fatalism in minimizing the value of earthly life and not being able to oppose things like war or caste seems psychologically harsh and undemocratic, but these were social constructs of the time.

Krishna teaches him: Karma yoga should involve non-attachment. “You have the right to work, but for the work’s sake only. You have no right to the fruits of work.” Without laziness, we should not be happy or sad about the fruits of efforts. “To unite the heart with Brahman and then to act: that is the secret of non-attached work” (*Song* II, pp. 40–41). This may seem to advocate resignation, but it is teaching on renouncing desire in this world and focusing on the everlasting, Infinite Brahman, beyond birth and death. “He knows peace who has forgotten desire. He lives without craving: Free from ego, free from pride” (*Song*, II, p. 44). Psychologically, this teaches orienting the ego to the archetypal Self, the divine within that Hindus call Atman. Even those active in social change might need this, to avoid anger and remain tranquil. Martin Luther King, knowing death threats for his civil rights protests, said: “I’ve been to the mountain-top” ... “I’m not fearing any man” (Washington 1986, p. 286). His ego was oriented to God while protesting racism.

Krishna speaks in the voice of the high divinity Vishnu, whom he personifies:

I am the birthless, the deathless, Lord of all that breathes. . . . When goodness grows weak, when evil increases, I make myself a body. In every age I come back to deliver the holy, the destroy the sin of the sinner, to establish righteousness. (*Song* II, p. 50)

This is the theme of the divine savior come to earth to aid goodness on earth.

The voice of Vishnu speaks of his presence in all the world:

My *Prakriti* [primordial nature] is of eightfold composition: earth, water, fire, air ether, mind, intellect, and ego. You must understand that behind this, and distinct from it, is That which is the principle of consciousness in all beings, and the source of life in all. It sustains the universe. . . . I am the birth of this cosmos; its dissolution also I am the essence of the waters, the shining of the sun and the moon; OM in all the Vedas, the word that is God. (*Song* VII, pp. 70–71)

Earthly suffering comes from the delusion that this world is ultimately real and its desires are important. Psychologically, ego cannot see beyond its desires and thus suffers. But liberation comes from seeing the Ultimate in all things: “Others worship me, knowing Brahman in all things: Some see me one with themselves, or separate: Some bow to the countless gods that are only My million faces” (*Song* IX, p. 81). This openness to polytheism as the many faces of the one ultimate absorbs other religions into itself – a characteristic mark of Hindu religious toleration:

Even those who worship other deities, and sacrifice to them with faith in their hearts, are really worshipping me, though with a mistaken approach. . . . Those who sacrifice to the various deities will go to those deities. The ancestor-worshippers will go to their ancestors. Those who worship elemental powers and spirits will go to them. So, also, my devotees will come to me. (*Song* IX, p. 83)

Even the Hindu teachings that one must climb the ladder of the caste system through many rebirths, Krishna here opposes:

Even those who belong to the lower castes – women, *Vaishyas* (merchants), and *Sudras* (servants) too – can reach the highest spiritual realization, if they will take refuge in me. (*Song* IX, p. 85)

This more democratic teaching was adopted by other Indian religions, notably Buddhism. These teachings are very refined, suited to mystics, but taught to all.

Brahman is beginningless, transcendent, eternal He is within and without . . . undivided, He seems to divide into objects and creatures (*Song* XIII, pp. 102–03).

The theology of the infinite oneness beneath all manifest reality developed in *Vedanta* Hinduism.

Although there are many rules in the many varieties of Hinduism, from the caste system to ritual procedures, purifications, and patriarchal rule, Krishna teaches in the *Gita* a refined message that is highly revered:

To love me is to know me . . . Now I have taught you that wisdom which is the secret of secrets. Ponder it carefully. Than act as you think best. (*Song* XVIII, pp. 128–129)

Kristeva, Julia

Carol L. Schnabl Schweitzer
Pastoral Care, Union Presbyterian Seminary,
Richmond, VA, USA

Kristeva's Life

Julia Kristeva was born June 24, 1941, in Sliven, Bulgaria. Her writings span topics including the following: art and art history; literary theory and criticism, in particular the study of semiotics; psychoanalysis; the abject; feminism; love; the maternal; melancholy; religion; the stranger; culture; and her somewhat autobiographical novels. She has been identified with structuralism but has made significant contributions to post-structuralist thought.

Being the recipient of a doctoral fellowship brought Kristeva from Bulgaria to Paris in December 1965, and she began her studies in January 1966 in literary criticism. In 1973, she was awarded her Ph.D. at which time she became a professor of linguistics at the University of Paris VII where she continues to write, teach, and practice today. The following year her dissertation *Revolution in Poetic Language* was published, and she visited China. Her trip to China inspired her book *Des Chinoises (About Chinese Women)* and prefigures her lifelong professional interest in the sacred and the feminine.

From 1976 to 1979, Kristeva studied psychoanalysis with Jacques Lacan. Her son was born during this period. Her interpreters herald this time as the beginning of a change in her writing style, evident with the French publication of *Powers of Horror* in 1980 (Kristeva 1982, p. vii). Her early works are deemed more theoretical – and therefore, less readable – bringing together perspectives from Marxism, psychoanalysis (i.e., Freud and Lacan), Bakhtin, and Barthes. Her later works appear “more relaxed, more readable, more concrete, more plural – some would say, more human – than the more theoretical works

of the late 1960s and the 1970s” (Crownfield 1992, p. xii, xiv). *Powers of Horror* and subsequent texts begin to focus on the maternal and the feminine in culture. She has delineated three periods of feminist thought in her essay “Women’s Time,” but her location as a feminist writer is controversial among many feminists in the United States as a direct result of her interest in motherhood (Kristeva 1995, pp. 201–224).

Kristeva’s writings were and continue to be influenced by her childhood. She grew up in a middle-class family which was ardently Roman Catholic; her parents did not belong to the Communist Party, and this reality limited the schools where Kristeva could study. The “better” schools were reserved for children of the party-faithful, which led to Kristeva’s early education in a French language Catholic school. She did, however, participate in Communist Party children’s groups as well as youth organizations. The tension between religion and psychoanalysis, or Christian faith and psychoanalysis in general and in Kristeva’s own life in particular, is illustrated by a comment she made during an interview in 1992:

My childhood unraveled right in the heart of Sofia. For me, Sofia can be boiled down to the Saint Nedelia cathedral, with its little gardens, its snowy slopes on which I would throw my toboggan, its secret rooms, and its nervous believers. My father, a faithful man whose beautiful voice added to the Saint Nedelia church choir, would bring me to the cathedral before dawn so that I could take communion without being spotted. *I eventually rebelled, not because I was bothered by the dissidence of the act but because of universal reason, which is, I still find, harder to understand and to embody than faith is.* (Interviews, 1996, 137–38, my emphasis)

Kristeva's Work

The dissonance between universal reason and the lived experience of her childhood is still evident in her writings today as she grapples with the dissonance between faith and reason (psychoanalysis). Though Kristeva maintains a posture of an atheist, she acknowledges that contrary to Freud she does not believe religion is solely an illusion which

contributes to neurosis (Kristeva 2007, website excerpt). Yet unlike so many feminist writers, she does maintain a conversation with Freud through the influence of her teacher, Lacan. In fact, she contends that the modern-day therapist has superseded the local priest/minister because religion no longer provides a privileged space for human communication and the language system employed in religious discourse ultimately becomes a source of oppression – particularly for women because it excludes the feminine/maternal.

For those who count themselves among the religious (especially Christian believers), Kristeva suggests that restoring religious discourse to its full positive value provides a source of psychic healing. Her proposal for this includes an expansion of metaphor in the therapeutic relationship to include the feminine or maternal and an understanding of the transference relationship as a loving relationship which has as its foundation maternal love (i.e., since all loving relationships have maternal love as their source according to Kristeva). Based on Kristeva's proposal, I have concluded elsewhere that the role of a pastoral counselor (or any therapist for that matter) is "to be a loving, 'forgiving other' – someone who listens with tact or a delicate perception of another's affect. To listen with a forgiving attitude means that I give a gift of understanding to another. I must deprive myself of my own understanding and judgment even though I continue to ask questions" (Schweitzer 2010, p. xiv). Thus, one hallmark of the therapeutic task understood from this perspective is to become "an other who does not judge but hears my truth in the availability of love, and for that very reason allows me to be reborn" (Kristeva 1989, p. 205). One may want to conclude (and I do) that there is at least a resemblance between Kristeva's understanding of a transference relationship in the analytic process and the Christian notion of *agapé* as well as an analogy between Christian transformation and the psychoanalytic rebirth that occurs in the context of a therapeutic relationship.

Kundalini

Rupali Das

Department of Humanities and Social Sciences,
National Institute of Technology Rourkela,
Rourkela, Odisha, India

Kundalini in Hindu cultural tradition refers to rapturous energy. It is the primitive source of *shakti* or feminine energy that signifies creativity and potentiality. Kundalini is believed to transcend the basal carnal energy into a cosmic one. The word comes from the Sanskrit root *Kundalin*, which means a state of being like a serpent coiled up three times. It is widely believed that Kundalini remains dormant in each person as if in a snake-form at the base of spine, specifically into a triangular-shaped bone “sacrum” which, in Greek mythology, is considered the most sacred part of the body. To awaken Kundalini, a practitioner of yoga first needs to evoke his/her vital life force or *prana*, a dynamic energy in a static body along with practicing meditation and *pranayama* (“conscious control of respiration”). Once the practitioner of yoga starts performing these steps, a cathartic feeling is induced by effacing the unpleasant emotions generating from the gross body. Ultimately, he/she might succeed in achieving an absolute state of unconsciousness through the cosmic power, when the gross body can no more be attached with the subtle mind. The centripetal and centrifugal nature of Kundalini energy is aroused through several *chakras* or temporary storehouses of energy. Scholars such as John George Woodroffe (1919), also popular by his pseudonym Arthur Avalon, and David Gordon White (2000) suggest that Kundalini is the absolute divine energy in latent stage, flowing throughout a channel *susumna*, connected with two *nadis* (nerves) – *Ida* (consciousness) and *Pingala* (life).

It is widely believed that *muladhara*, or the root chakra, is where the serpent lies sleeping. Other chakras such as *svadhisthana* (believed to be located at the reproductive region), *manipura*

(located at naval area), *anahata*, (located at heart), and *visuddha* (associated with throat) control sexual energy, temperament, emotion, and speech, respectively. *Ajna* chakra opens the “Third Eye” or the inner eye that leads a yogi to *sahasrara*, the crown chakra, located on the top of the head, where the practitioner envisages the effulgence of God. It is the citadel of all the seven centers, structured like a lotus containing the hundred petals (likewise the nerves of a human brain are structured).

In Hinduism, Kundalini shakti has been interpreted in different ways by several sages and yogis over time; moreover, the core belief about the dormant cosmic energy in material body is a central concept in its categorization. Kundalini was mentioned in the sacred scripture of the Rig Veda which was believed to have been compiled by the Aryans between 1200 and 900 BCE, though it was orally transmitted before the said time-span. Yogic practice is deep-seated in Vedic culture as the *mantras*, the *pranayamas*, and the meditation are very crucial to attain *moksha* or ultimate liberation from the mundane world. Vedic mantras are incredibly powerful to unite *jivatma* (individual self) with *paramatma* (Brahman). It magnificently explains how individual “i”(self) or the cosmic energy gets united with the universal “I” (Brahman) or the divine power in a greater cosmos. In the Rig Veda, the most essential deities associated with Kundalini awakening are Surya (Sun), Agni (Fire), and Indra (Thunderstorm). The Vedic reference of “rising sun” is much more analogous to Kundalini rising since darkness disappeared with the emergence of Surya or the Sun God. For Vedic people, Surya is the *paramatma* or “primordial self”; it is suggested that the great sage Vishvamitra introduced the Gayatri Mantra, a prayer, and it enlightened humans by these optimistic spurring words “May the Almighty God illuminate our intellect to lead us alone the righteous path” (3.62.10, Rig Veda). It is the giver of life (*prana*) and light (light of knowledge) which opens the mysterious door to experience the Brahman. In the Vedic Pantheon, Agni, the Divine “Fire” also represents the spiritual power that consumes all darkness and transforms ignorance to wisdom, for which yogis

are hankered after since time immemorial. In that sense, Agni is believed to be kundalini energy as it is the other form of consciousness, and Surya is the ecstatic state when a yogi experiences its supernatural faculty. Indra or Vayu embodies superhuman power that might destroy the evil designs of the *asura*, or the demon and likewise; Kundalini shakti can erase all sorts of negativity and impurity, which are hindrances in the path of achieving the absolute truth. Yogic connection was already there in the Bhagavad Gita, a central text in practicing Hinduism. The spiritual passage from *atman* to *Brahman* is significantly notified in the Upanishads to achieve “*nirvana*” or emancipation. John George Woodruffe (1919) believes: “It is possible to see Kundalini with the mental eye, and in this way to experience Her without arousing Her and bringing Her up, which can only be affected by the yoga methods prescribed. Kundalini may have thus been seen as Light in the basal center (*muladhara*).” (*The Serpent Power*. Illus. Veeraswami Krishnaraj, p. 10. web.)

In Tantric philosophy, the Sanskrit root *tantram* means “loom” or the wrap of the threads (here *tan* is “to stretch”) and as a whole it figuratively indicates a system or a doctrine. Tantrism is a part of Agamic tradition and Agama texts can be divided into three major sections, viz., Shaivism, Vaishnavism, and Shaktism. Tantra is an esoteric practice that releases perpetual energy flow and filters human mind from unhealthy emotions. At the time of spiritual degeneration, the tantric practice gains its momentum. Supernatural power, emancipation from sins, and experiencing Brahman are the central ideas in tantric philosophy. In respect to experiencing God, tantric philosophy has a different approach from that of the Vedic one. On the one hand, Vedic philosophy firmly believes that complete detachment is the only way-out to experience Brahman which means, a yogi must go beyond the mundane world by overcoming all earthly limitations and *maya* (disillusionment), and on the other, the practitioner of tantra or the *tantrika* usually believes that one can attain *moksha* or spiritual emancipation without being separated from the mundane world. It is thus possible within this *samsara* or

the material world. With respect to its primary objectives, the Vedic yoga and the tantric yoga share the same goal, i.e., to raise kundalini shakti, the feminine power, that gradually makes yogis reach the path of salvation or deliverance from earthly sins through meditation. The tantrikas used to believe in the multifaceted steps of yoga such as *asana* (posture), *pranayama* (meditation), *puja* (worship), *mantra* (chanting hymn), *kriya*, *mandala* (geometric symbols), and *mudra* (gesture) to accomplish tantra. There is a very subtle difference between tantric yoga and Kundalini yoga since both are directed to the same goal, i.e., to attain *Samadhi* which “is described as a state in which the mind is conscious of only the object of concentration, and is devoid of any notion of the self as perceiver” (Lochtefeld, p. 585). The notion of *siddhi* and *sadhana* in tantric tradition is also significantly related to Kundalini rising, as *siddhi*, a spiritual attainment, most specifically defined as “a superhuman power or faculty,” is unleashed through *sadhana* or meditation (Lochtefeld 2002, p. 650). At the heart of tantric philosophy, there lies nondualism which signifies a supreme state of consciousness where mind-soul dichotomy is dissolved. Subtle body is the rudimentary aspect of tantric yoga. The complete union of *Shiva* and *Shakti*, the bipolar forces in the subtle body, helps tantrikas to gain *moksha* or the ultimate liberation from *maya*.

Ramakrishna Paramahansa (1836–1886), a Hindu mystic, unites Kundalini shakti with absolute wisdom. For him, devotion to God and Kundalini awakening are the two-fold nature of wisdom. He staunchly believes that a person having wisdom should not only be a Vedantic scholar but also be a genuine devotee to Iswara (God). Opposed to the traditional belief that the world is an illusion or *maya*, Aurobindo Ghose (1872–1950), another poet-saint, suggests that the world is rather the manifestation of *atman* and *paramatman*. In order to experience the *sachchidananda* or the ultimate reality, Aurobindo popularizes “integral yoga,” a new form of yoga that combines the essential divine knowledge (Vedic culture) and organized power (Tantric philosophy). It is suggested that by

practicing integral yoga, humans can achieve higher consciousness through spiritual transformation after opening up the centers and the planes (human consciousness consists of physical plane, vital plane, and mental plane). This cosmic energy is mentioned indirectly by the poet in his phenomenal epic *Savitri: A Legend and a Symbol* (1940). In popular culture, the concept of a superhero having supernatural power may explore a subtle indication about the dormant cosmic energy in a gross body. At present, scientists, philosophers, and mystics from different regions are seeking the ultimate source of the dormant energy in each individual, and there is a politics of appropriating the same with Kundalini energy.

Labyrinth

Kelly Murphy Mason
Psychotherapy and Spirituality Institute,
New York, NY, USA

The labyrinth is an archetypal form found in disparate cultures across eras spanning from prehistory to the present day, when it has experienced resurgence in popularity due to interest in its psychospiritual applications. Regardless of how it is styled, a labyrinth is marked by a shape, usually a symmetrical one, containing a unicursal path to or through a center point. This distinguishes it from a maze, which is multicursal and contains dead ends. Following the path of the labyrinth, the traveler is eventually and inevitably brought to the center and then back out again. While travelers may not know where exactly they are on this labyrinthine path, they are never lost, but rather, somewhere along the way they need to travel. As a result, the labyrinth has become common both as a metaphor and as a symbol of the human pilgrimage through life. A great deal of conjecture exists about its history, origins, and purposes, suggesting that the labyrinth has proven fertile ground for the imagination for millennia.

Its universality among prehistoric cultures indicates the so-called classical labyrinth was a primitive form of symbolic communication, perhaps an earliest form of written transmission. It was drawn from a central cross surrounded by

four angles and four seed points that were connected until seven circuits were contained in its circle. Cave etchings of this particular labyrinth appear circa 2000 BCE in Spain (Saward 2002). These symbols appear at approximately the same time in the Indian subcontinent, as well. Later, multitudinous stone arrangements of the similar symbols appeared in Scandinavian soil, often near the coast, leading some to speculate that seafarers would walk them in preparation for their journeys over water.

In mythology, the labyrinth first appears in the Greek lore surrounding the Minotaur of Crete. Unmistakably, the Cretan labyrinth was a built environment, an architectural structure, yet coins from Knossos featured the rounded, two-dimensional form of the classical labyrinth as its signifier. Later, Romans exported labyrinth mosaics throughout the Roman Empire (Kern 2000), from Great Britain to Eastern Europe to North Africa. Some were purported to be sizable enough for people to travel on horseback; others were too intricate to serve anything other than decorative purposes. Roman labyrinths are distinct for their sharp angularity, both in their pathways and their outlines.

The Hopi tribes of North America had a squared version of the labyrinth that they used in addition to the classical labyrinth (Conty 2002); it was unique in having two entrances. The Pima tribes, in their depictions of labyrinths, placed a human figure at the very entrance, in what later became known as “The Man in the Maze” pattern.

This man was thought to be seeking the mythic place of his origin as a place of eternal return. Labyrinths were associated with a variety of burial rituals in Celtic cultures as well as Egyptian society, where they were believed to protect the sanctity of the tomb.

Despite its strong association with pagan rituals, the labyrinth was adopted rather quickly by the early church. In an Algerian church was found a labyrinth dating from the fourth century BCE (Matthews 1970); its center circle contained the slogan “*Sancta Ecclesia*,” translated “Holy Church.” The destination of the spiritual journey was no longer reunion with the earth but inclusion in corporate Christendom. Interestingly, there was a profusion of varying forms of labyrinths across different churches during the Middle Ages, some square, some circular, and a few octagonal.

At Glastonbury Tor, thought to be site of the first church built in England, an oval-shaped labyrinth appears to have been carved into the landscape the tower sat atop, so that entrance to it would be gained by walking the steep incline of winding circuits. Such large-scale, three-dimensional labyrinths also appeared in Peru, where they figured as features in the geoglyphs of totemistic animals used in the rituals of indigenous earth-centered religions.

By and large, Christian labyrinths belonged in the interiors of churches rather than their exteriors, although turf and hedge labyrinths were fairly frequently found in English gardens and church grounds. Often, the labyrinth was placed near the entry of the church building. These labyrinths were sometimes called “*Chemin de Jerusalem*,” the Way to Jerusalem, because they allowed European churchgoers to enact a pilgrimage to the Holy Land at a time when both its distance and ongoing Crusades made such travel nigh impossible. Members of the clergy would walk the labyrinth as an Easter ritual representing Christ’s decent into hell, bodily resurrection, and ascent into heaven. Many monks traveled the labyrinth on their knees.

Perhaps the best known Christian labyrinth is found on the floor of Chartres Cathedral. Completed sometime in the early thirteenth century, its 11-circuit course led to a 6-petalled rosette in the center, outlined in more than a hundred lunations. Much speculation has existed around the esoteric numerology and sacred geometry of the various labyrinths that appeared in churches (Lonegren 2007). Whether or not the Chartres labyrinth was devised as a specifically Marinal devotion, it was obviously not cruciform, as was the octagonal Maltese labyrinth so suggestive of more martial Roman forms (Fig. 1).

Labyrinth,

Fig. 1 Walking the labyrinth at Cathédrale Notre-Dame de Chartres, France. (This file is licensed under the Creative Commons Attribution-Share Alike 3.0 Unported license. http://en.wikipedia.org/wiki/File:Labyrinth_at_Chartres_Cathedral.JPG)

General consensus holds that the Chartres labyrinth pays homage to the feminine aspect of the divine dimension with its womb-like appearance evocative of not only actual birth and death but also spiritual rebirth. The continuous pathway can be viewed as representative of the original passage through the birth canal. Some have even suggested that the Chartres labyrinth was actually used as a birthing instrument; either way, its feminine form would be unmistakable to worshippers.

Many churches and cathedrals saw their labyrinths removed or hidden in the centuries that followed, quite possibly as part of a larger repression of the feminine principle or a backlash against vestigial goddess worship from older traditions. Evidence exists that some pagans may even have used the labyrinth in their mating rituals. The obvious physicality of a walking the labyrinth might have suggested a sensuous and immediate experience of the Divine that organized religion would attempt to control more closely in the West.

It is precisely such kinesthetic engagement that has recently made the labyrinth so appealing to contemporary travelers whose spiritual yearnings have been unfulfilled by religious dogma and formalized worship. In a contained and sanctified way, it offers travelers a chance to practice walking meditation and full-body prayer. In doing so, it combines active and contemplative approaches to self-realization (Artress 1995).

A labyrinth is clearly an exercise in intentionality. Its traveler is no further along spatially than when the walk was begun and actually backtracks at several different points. The labyrinth thereby challenges some dominant notions of linear progression, time urgency, and outward orientation, suggesting that meaningful personal journeys might involve internal shifts that are as significant as external ones.

As a visual metaphor for journeying within, the labyrinth has also served as a powerful imagistic representation of the psychotherapeutic process, as well as the spiritual quest. The circuits of a labyrinth are vaguely reminiscent of the whorl of a fingerprint, that powerful symbol of personal identity (Attali 1999). The possibility of truly

knowing one's own self emerges as one looks inwards.

The existence of a sacred interiority becomes recognized and transitional/transformational space gets created in depictions of the labyrinth. Today people may trace finger labyrinths as a meditative practice or else contemplate line drawings of the labyrinth which they can either "walk" with their eyes or consider as a unified symbol of wholeness. Entire classical labyrinths can be easily constructed from just a few simple marks drawn in the earth. The labyrinth can in turn serve as a sacred experience, sacred space, or sacred image.

Such versatility allows the labyrinth to help its travelers bridge some of the mind-body divide, paradoxically by allowing them to ground themselves in the numinous. Circumambulating the labyrinth is a right-brained activity that allows for flashes of intuition. The winding way becomes clear, and in that process, wandering suddenly becomes purposeful. For this reason, ritual use of the labyrinth now often occurs at liminal times (Curry 2000), whenever people find themselves at a threshold in their lives.

Commentary

The labyrinth has been called the Mandala of the West because of its apparent usefulness as a meditative tool and nonlinear activity. It seems to be a culturally consonant symbol that expands consciousness and contains the potential for both psychospiritual integration and healing. The strong revival of interest in labyrinths in Western societies has given rise to numerous organizations promoting their use, organizations that are religious and secular alike, resulting in an international movement to increase their availability in shared spaces. Literature on the topic has proliferated in recent decades.

Even as research into the past and future uses of the labyrinth continues, however, it runs the risk of remaining speculative on the question of its distant origins and almost global ubiquity. What seems clear is that the growing popularity of the labyrinth is a response to a contemporary spiritual

yearning to feel more grounded and centered. Through its indirection and reversals, the labyrinth appears to provide people an alternative to the frenetic pace of modern life and a greater sense of continuity with the past, possibly by suspending animation to a degree. Its symbolism has remained alluring and evocative through millennia of human history.

Lacan, Jacques

John Pahucki
Department of Humanities, SUNY Rockland,
Suffern, NY, USA

Jacques Lacan (1901–1981) was a French psychoanalyst associated with the literary and philosophical movements of structuralism and post-structuralism. A notoriously abstruse thinker,

Lacan, like many French intellectuals associated with postmodern thought, has often been accused of being deliberately obscure in his writings. This is particularly true of his major work, the *Écrits*, which is noted for its difficulty.

Lacan is known for his claim of a “return to Freud,” though in actual practice this amounted to a radical reconfiguration of Freudian psychoanalysis as Lacan attempted to effect a synthesis between Freud’s biologically driven psychology and the linguistic theory of structuralists like Ferdinand de Saussure and Roman Jakobson. Freud’s biologically founded subject is thus replaced, by Lacan, with a linguistically constituted subject, with the Freudian drives and even the body itself transliterated or overwritten by culturally specific signifying activities. In this view, the linguistic register of one’s culture channels and determines the directionality and movements that the biological drives assume. The Freudian unconscious, formerly the a priori well-spring of irrational drives and biological pulsations, is also viewed as a linguistic product, an a posteriori consequence of our entry into the linguistic register. The unconscious possesses rules analogous to the syntactical structures which govern the conscious linguistic subject, hence Lacan’s famous claim that the “unconscious is structured like a language.”

Lacan is perhaps best known for the three orders of the *imaginary*, the *symbolic*, and the *real*. The imaginary order is inaugurated by what Lacan described as the “mirror phase” which occurs roughly at six months of age. In this phase the child identifies with a “specular” and exteriorized image of itself, in an actual mirror or in the mirror of the “other,” which it then introjects in order to stabilize and master its bodily sense. The imaginary order, being based on this fundamental misrecognition of the self in the form of a falsifying image, thus results in a state of alienation.

This alienation is compounded by entry into the symbolic order (or linguistic register) which occurs when the child is forced to accept the “law” of the *Name of the Father* (*le Nom du Père*). With the adoption of language, the subject is inscribed

or overwritten by signifiers, thus being made subject to the regulative strictures and organizational principles embedded within the culture's system of signification. The symbolic order is therefore *Other* to the subject, being imposed and not truly adopted. Lacan's ubiquitous use of the term *Other* most often refers to this otherness of language. The direct consequence of entry into the linguistic register is "symbolic castration," a notion which replaces Freud's oedipal drama and its threat of actual physical castration with the subject's loss of *jouissance*, an untranslated term that refers to a preoedipal enjoyment of the object no longer possible for the linguistic subject. In keeping with this rejection of Freud's biological schema, Lacan replaces the organ of the penis with the symbolic phallus, a term which refers to this preoedipal state of dyadic fusion with the maternal object.

The real is much more difficult to describe, as it is the order of experience which completely resists symbolization. It may be the undifferentiated state of being that precedes linguistic acquisition or it may refer to significantly traumatic experiences which resist articulation.

Lacan's theories have generated considerable interest among philosophers, literary and religious studies scholars, and feminists preoccupied with continental thought generally and the postmodern "decentered" subject specifically. His influence is particularly evident in the psychoanalytic work of Julia Kristeva.

Laing, Ronald David

Daniel Burston

Department of Psychology, Duquesne University, Pittsburgh, PA, USA

Life and Career

Ronald David Laing was born on October 7, 1927, on 26 Ardbeg Street in the Govanhill district of Glasgow and died on August 23, 1989, in St. Tropez, France. Like his father, Ronald Laing was musically gifted and received a Licentiate in music from the Royal Academy of Music at age 16. At 17, he enrolled in Glasgow University, and at 18, specialized in medicine. Because of the Korean War, military service was mandatory, and so in 1949, Laing did basic training. After a brief apprenticeship in neurosurgery at Killearn in 1950, Laing spent 1951–1952 as an army psychiatrist. In 1953, now a captain, Laing was placed in charge of the Army hospital in Catterick, in Yorkshire. Soon thereafter, he left the Army for the Royal Gartnavel Hospital and Southern General Hospital (Glasgow), where he worked under Dr. Ferguson Rodger. Rodger brought Laing to the attention of Dr. J. D. Sutherland, the Director of the Tavistock Clinic. With the help of Sutherland, and his successor, John Bowlby, Laing came to London in 1956 to train as a psychoanalyst (Burston 1996).

During his psychoanalytic training, Laing completed *The Divided Self*, a classic in existential psychotherapy (Laing 1960). His second book, *Self and Others*, appeared in 1961 (Laing 1961). From 1962 to 1965, he worked as the Director of the Open Way Clinic, founded by E. Graham Howe, one of the few places in Britain where Freudian and Jungian therapists worked together comfortably. In 1964, Laing and Aaron Esterson, another Glaswegian psychiatrist, published *Sanity, Madness and the Family* (Laing and Esterson 1964). Laing also published *Reason & Violence: A Decade of Sartre's Philosophy* with South African psychiatrist Dr. David Cooper that same year (Laing and Cooper 1964).

Critique of Normality

In February of 1967, Laing published *The Politics of Experience* (Laing 1967). Though not his best book, it was the most influential, and one feature of the book that gripped many readers was Laing's sweeping critique of "normality," which Laing described as a state of profound self-estrangement or alienation – alienation being a hot topic at the time. By Laing's reckoning, the galloping self-estrangement that plagues Western civilization fosters a progressive attenuation of the average, adjusted person's critical faculties and their openness to transcendental experience, a state more akin to a deficiency disease than to genuine mental health. What is lost to normal people are not merely instinctual urges, or the memory of specific events or losses, as Freud suggested. The awareness of the tragic, the sublime, and the absurd, of the prevalence and persistence of evil, and of the peace that passes understanding – these innately human sensibilities are severely stunted, if not entirely extinguished in the struggle to adapt to an increasingly one-dimensional world.

In retrospect, it is interesting to note how often Laing disparaged normality with religious tropes and metaphors. In chapter 3, for example, he says (p. 68): "We are all fallen Sons of Prophecy, who have learned to die in the Spirit and be reborn in the Flesh" (Laing 1967). And again, in chapter six:

There is a prophecy in Amos that a time will come when there will be a famine in the land, 'not a famine for bread, nor a thirst for water, but of hearing the words of the Lord.' That time has now come to pass. It is the present age (Laing 1967, p. 144).

Without saying so in quite so many words, passages like these implied that the loss of the sacred as a feature of *normal* experience is linked with the problem of individual and collective violence. But according to Laing, the escalating scale and widening scope of violence in our time is *not* the result of innate propensities to violence and indiscipline – a "death instinct," as Freud thought – but of *the violence we do to ourselves* in our efforts to adapt to an increasingly irrational world that is bereft of genuine transcendence. In

other words, Laing implied that there is a strong correlation between the numbing routine, the mindless consumerism and the shabby ethical compromises of daily life in postindustrial society, and the steady proliferation of evil.

That being so, it is important to note that *The Politics of Experience* was published at the height of the Vietnam War, when Christian, Jewish, and Muslim fundamentalism had no appreciable impact on world affairs. For members of Laing's generation, who came of age during the Korean War, religious wars were a distant memory, rather than a growing and undeniable threat to global stability. Much as he lamented the loss of the numinous, Laing was not advocating a return to a repressive, theocratic society or advocating the revival of religious creeds based on the unreflective embrace or vehement defense of particular forms of belief. Had he lived to witness our present global predicament, Laing would probably have characterized the resurgence of Jewish, Christian, and Islamic fundamentalism as a reversion to *pseudo-religious* attitudes and passions, rather than the genuine article.

Metanoia

In any case, in contrast to mere normality, Laing maintained that true sanity can only be achieved through the dissolution of the socially adjusted ego (or persona) in a process which he termed "metanoia." Ego transcendence, said Laing, can be sought gradually and deliberately through meditation and spiritual practices, or it can occur spontaneously. The mad person, said Laing, is often catapulted into this process unawares and, without skillful guidance, will go astray, exiled indefinitely in the demonic realms that enshroud and obstruct our access to the holy. However, given appropriate care, many psychotics can recover their emotional and intellectual equilibrium without recourse to psychotropic medication or other intrusive or coercive treatments, with the help of a seasoned therapist who is in touch with his or her own psychotic core and is not intimidated or overwhelmed by the severity of the patient's symptoms.

Like Jung before him, Laing borrowed the word “metanoia” from the New Testament to describe the dissolution of normal egoic consciousness. When translated from the original Greek, this word is usually rendered as “repentance.” The problem with this commonplace translation is that it dwells primarily on the subject’s sense of sinfulness and his (or her) earnest desire to shed sinful habits and desires. But in the original Greek, the term “metanoia” connotes an epistemological upheaval, a radical change of perspective, and a total and irreversible change in one’s view of oneself and the world – in short, an epiphany or enlightenment experience more akin to the ancient idea of “gnosis” than to moral reform or reconstruction.

Laing’s Christian Roots

Though few readers were aware of it, R. D. Laing combined a rare appreciation of Asian wisdom and spiritual practices with a heartfelt immersion in Christian spirituality – a trait that he shared with E. Graham Howe and Alan Watts. Nowhere is this more apparent than in an interview with Yoga scholar Georg Feuerstein, entitled “Sparks of Light,” which appeared in 1983. “Sparks of Light” contains many of his most profound reflections on spirituality, but was not delivered in his usual style. Laing himself acknowledged this, admitting that he was finally expressing himself in a Christian idiom that he had become “. . . less embarrassed about affirming in the course of the last thirty years or so” (Feuerstein 1983).

Why embarrassed? During the Cold War Era, when Laing rose to prominence, people tended to regard anyone who spoke often and earnestly of their faith outside of their immediate circle as being somewhat odd and ill educated. However, this statement also conveys the misleading impression that though his reluctance to speak about it had diminished in the last few decades, his faith had been constant throughout. This is simply not so. Indeed, the cumulative impression one gets is that Laing spent most of his adult life as a reluctant and sometimes deeply anguished agnostic who longed for the consolations of

faith, but could not overcome his doubts and misgivings sufficiently to affirm what he desired to believe – sometimes ambivalently, sometimes wholeheartedly. This is the real source of his “embarrassment.”

What kind of Christian was Laing, when he was not overwhelmed by doubt? As a teenager, Laing was exposed to the Evangelical-cum-fundamentalist variety of Calvinism and to the older “Celtic Christianity” that arrived in Scotland with Brendan the Navigator (c. 484–c. 578) and St. Columba (521–597), both of whom played a significant role in the building of Iona Abbey on the Isle Iona, in the Lower Hebrides. By the age of 14, Laing claimed that he had emphatically Evangelical Christianity in favor of the latter, Celtic variety. This claim is born out of his on again/off again relationship with the Very Reverend George MacLeod (1895–1991), who like Laing, incidentally, was a native of Glasgow who rose to the rank of Captain in the British Army. McLeod was the founder of The Iona Christian Community, an ecumenical community dedicated to the preservation of Celtic Christianity and the erasure of world hunger and poverty, based on the Isle of Iona in the Lower Hebrides. Though few people are aware of it, Laing spent many weeks there over the course of his career. Indeed, in the early 1980s, Laing even pondered the possibility of situating a foundation to be called St. Oran’s Trust on this fair island.

Laing’s leanings toward Celtic Christianity are also evident in his remark to Feuerstein that we are all one in “the Universal Fire.” Indeed, said Laing, our individual souls are nothing but “sparks” emanating from this universal fire. Classicists contend that the idea that the soul is a “spark” of a Divine Fire probably originates in the Orphic religion, but gets taken up by Plato in the fourth century BCE and subsequently, by the Stoics and neo-Platonists in the Hellenistic-Roman era. While originally a school of pagan philosophy, Neo-Platonism and the emanationist approach to theology later took on Jewish, Christian, and Islamic forms, and as we survey the history of Western spirituality, the imagery of the soul as a Divine spark becomes a common idiom for mystics of all three monotheistic traditions.

Another striking feature of his talk with Feuerstein is that when asked to share the fruits of a lifetime of introspection, Laing responded that he discovered “that hope is justifiable.” The term “hope” does not surface often in Laing’s work, and though he vigorously repudiated the suggestion, many readers – friends and critics alike – found *The Politics of Experience* to be an angry and eloquent expression of overwhelming despair. If so, of course, Laing had clearly recovered some of his optimism in the interim. Meanwhile, the suggestion that hope is justifiable and that this represents a hard-won discovery on his part, says a great deal about him personally.

That being so, it is also instructive to note that Laing tries here – and not for the first time – to link the idea of love to the project of scientific inquiry and that Laing often despaired of getting psychiatrists to see that viewing their patients primarily or exclusively through the lenses of the natural scientific attitude is profoundly dehumanizing. The idea that science is (or ought) to be informed by a loving, reverential attitude toward nature was self-evident to someone like Einstein, but is odd and incongruous to most scientists, so Laing justified this linkage by pointing to the destructive potential of scientific research that lacks this basis. He said:

If you investigate and inquire into the world without love, you don’t find anything worthwhile. If you look at a tree or a frog or anything at all without the eyes of love, then you obtain only loveless, heartless knowledge. When such knowledge is accumulated and applied to practices of scientific technology, it becomes the most destructive form of knowledge ever discovered. Even the worst black magic cannot vie with the destructive capacity of science. Its very method is to destroy what it looks at in order to discover its elements.

Language and Thought

Amitabh Vikram Dwivedi

College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

Linguistic possession probably makes us different from animals. According to some civilizations, language is the source of human life and power so much, so that for some African people, a new born baby is a kintu “thing,” and not a muntu “person” until he/she acquires a language. Also, in Indian society, the world is referred to as matalabi “selfish/meaning finder.” The nature of language throws light on the understanding of thought and humanity. To know a language means to express yourself and to understand others in order to reach meaningfulness. The aim of religious language is to make religious utterances and sentences meaningful and to make the

followers thoughtful about religion. Religious utterances are supposed to generate religious thought in the mind of the followers, and for that, the scriptures encompass a variety of properties, agents, or states of affairs – such as holiness, grace, miracles, god, goddess, evil, and sinfulness. The religious language and thought is related to the meanings associated with God, good, and godliness. Further, we will discuss language and thought with respect to religion and psychology.

Discussion

Similar to natural language, the religious discourse is also universal and found in all human societies in organized or unorganized form. At surface level, we may find that religious discourses are different from each other; however, at deep level, they possess some common features. So when we hear something religious, it generates a thought which informs us that it is religious. Chomsky talks about language instinct and universal grammar which he holds responsible for possessing natural language and similarities in the structures of all spoken languages, respectively (Chomsky 1972). Following that, can we claim that human beings also possess religious instinct – an inbuilt faculty to religious practice and belief – and can we say that like language, human mind has also become adaptable for religions?

Terrence Deacon rejects Chomsky's innateness hypothesis and claims that human languages have evolved to be acquired easily by immature minds. Is religion too a children's thing when Jesus says "Except ye be converted, and become as little children, ye shall not enter into the kingdom of heaven?" (Deacon 1997). Penfield and Roberts indicate a critical period for language learning, and posit critical period hypothesis in which they differentiate between the language-learning ability of children and adults (Dawkins 1976). Deacon suggests that a degree of immaturity is actually required for language acquisition instead. In a similar vein, is it true that religions infused in an early life have a different feel than adopted later

post-conversion (Deacon 1997). How come same religious language generates two different types of thought processing – some people become fanatics and other simply rational, cool-headed followers.

Some psychologists believe that the use of language and its speech patterns have subtle psychological effects on the speakers, and in this context, the apocryphal Jesuit saying "give me a boy until he's seven and he's mine for life" becomes more meaningful (Deacon 1997). But if religion like language is a children's thing, then how will we rationalize the decisions made by millions of fanatics for joining ISIS in their mature life? Are we indicating that language limits our naming and thinking process, and many people are affected by it in their early life, whereas some in their later life, and this affectiveness is arbitrary.

Since religion is structured upon language, the close connectedness between the two cannot be denied. However, linguistic structures in religion are more stable than the quotidian linguistic one. Probably, the followers can play sacred games more comfortably when the language is more archaic and unintelligible. Many religions have a sacred language, such as Sanskrit for Hinduism, Hebrew for Judaism, classical Arabic for Islam, Pali for Theravada Buddhism which is not intelligible to the followers, yet used in religious discourse.

Since languages evolve, and during the course of time, languages that came out from a single language become so different that they give a feel of two different languages, for example Irish, Welsh, and English. Similarly, religions also evolve; in Hinduism, the worshipping of Vedic gods, Indra, Varun, Sun was replaced by Brahma, Vishnu, and Mahesh, and their female consorts, and Christianity has been evolved from Judaism.

Levinas, Emmanuel

David M. Goodman
Harvard Medical School, Lesley University,
Cambridge, MA, USA

Emmanuel Levinas (1906–1995) was a Talmudist, ethicist, and continental philosopher whose thought has left a lasting imprint on contemporary philosophy and theology. His sophisticated ethical system that understands the self to be radically responsible for the Other has challenged conventional theories of selfhood, subjectivity, consciousness, ethics, metaphysics, language, and social relations. Furthermore, his ethical philosophy is beginning to find its way into psychological discourse concerning psychotherapy, human development, and definitions of selfhood.

Levinas was born in Kaunas (a.k.a. Kovno), Lithuania, in 1906 to a moderately affluent, Orthodox Jewish family. In his formative years, he was educated in traditional Hebrew school and was also heavily influenced by the work of Russian novelists such as Tolstoy and Dostoyevsky. In 1923, Levinas traveled to Strasbourg, France, for formal education in philosophy. Shortly after, he went to Freiburg, Germany, where he studied phenomenological theory and methodology under both Edmund Husserl and Martin Heidegger. These experiences impacted Levinas for the remainder of his intellectual career. Levinas translated Husserl's work into French, making him the first to introduce Husserlian phenomenology into the French academy (later read by Sartre and other prominent

thinkers). Husserl and Heidegger remained the primary dialogue partners within Levinas' philosophical works. He viewed their thoughts on consciousness, history, ontology, and metaphysics to be representative of the greater Western philosophical tradition he wished to engage and challenge.

Conversant in both Hebrew Scriptures and Western philosophy, Levinas represents a unique perspective on ethics. His project is sometimes described as *translation*, a communication of ancient Hebrew wisdom through the more dominant and universalizing trends of Greek rationality and the academy. Levinas' project continues to be mined for its far-reaching implications upon religious studies, philosophical systems, and psychological paradigms.

The historical context of Levinas' life further enriched the content of his writings and critique. Levinas' loss of his father, mother, and two brothers at the hands of the SS in Lithuania, along with his own imprisonment for 5 years during World War II, left a profound impression on Levinas' thought and interaction with Western philosophy. He claimed that many trends within Western thought had created an allergy to ethics and a form of ethical immunity for persons in the world. He understood many Western systems of morality to be failures and dangerous appendages to the violence making of the ego and human history as a whole. Levinas argued for movement away from the *love of wisdom* that had sustained Western thought since the ancient Greeks (and can be seen in modern science and psychology) to a *wisdom of love at the service of love* recognized within biblical tradition. Levinas called for "ethics as first philosophy" rather than ontology, traditional metaphysics, epistemology, doctrine, or sacraments.

Levinas' concern about violence, along with his desire to provide an account of human experience/phenomenology that recognized the inherent ethical call in the face of the Other, provided the basis of his first highly celebrated work, *Totality and Infinity*. In this work, he argues that the ego is not at rest within itself, but rather has a metaphysical desire for something beyond its own sameness (or immanence). Though the ego often

defends against otherness by reducing the Other to totalizing depictions (through intentional consciousness), there is a compelling command within the face of the Other that calls for responsibility. Levinas understood the face of the Other to bear a trace of the Divine (or infinity/transcendence). The dialogical philosophies of Martin Buber and Franz Rosenzweig were indelible influences upon Levinas' assertions concerning the irreducibility of the Other and the requirement of justice in human relations. As Levinas' work evolved, this responsibility became even more radical and his language for it more intense. By the time he wrote his second major work, *Otherwise than Being or Beyond Essence*, Levinas had come to emphasize the Other as bearing an alterity as radical as God's alterity. Furthermore, the Other's otherness, in Levinas' thought, wounds the banality and complacency of the ego and denucleates and decenters it. The ego loses its primacy and sovereignty and, instead, is hostage, persecuted, and traumatized by its inexhaustible responsibility for the Other.

For Levinas, one's psyche is ethically constituted and called forth into identity. The Hebrew expression, *hineni*, meaning "here I am," was his most succinct definition of the human psyche and the human self. That is, the self is always an ethical responsiveness, not a self-assertion or noun. To argue these points, Levinas engages in complex analysis about intersubjectivity and time, primordial encounter, interhuman subjectivity, and sensate experience.

Interestingly, Levinas peppers much of his philosophical treatises with rich religious terminology and illustrations (e.g., substitution, expiation, glory, Divine, transcendence, *hineni*, idol, and Abraham's departure from his homeland). This has created significant contention in the field of Levinas' studies concerning the theological characteristics of Levinas' thought. Some argue that his philosophy was fundamentally Jewish while others want to preserve a purist depiction of his thought as philosophical. This issue is complexified by Levinas' confessional writings and Talmudic commentaries. Levinas was not entirely clear about the relation of his religious beliefs to his philosophical works.

However, he was clear that he considered himself a translator of Hebrew thought (ethical concern for the Other as represented in ancient tradition) into and through Greek thought (dominant Western tradition). Though, he did not like the title "Jewish thinker" or "Jewish philosopher" to describe his work.

In addition to the works listed above, Levinas wrote many other social and religious commentaries and philosophical articles and books. By the end of Levinas' career, he had taught in the prestigious philosophy departments at the University of Poitiers, University of Nanterre, and University of Sorbonne. His impact on the landscape of 20th European continental philosophy has been and continues to be quite significant. Such thinkers as Blanchot, Derrida, Merleau-Ponty, Sartre, Lyotard, Marion, Pope John Paul II, and Ricoeur are just a few of the many noteworthy figures within Western thought that came under Levinas' influence.

Commentary

Levinas did not write directly about psychology in most of his works. Scattered references can be found – mostly of a critical nature – about the naturalistic, mechanistic, and reductive practices of psychoanalysis and behaviorism. Despite this, Levinas' thought has slowly begun to make its way into psychoanalytic dialogues, with comparisons done between Levinas and Winnicott, Lacan, Freud, and Jung. Existential-phenomenological schools utilize Levinas' work to further bolster claims about the irreducibility of the human person. Conferences and journals are forming that specifically target the interaction between Levinas' ethical philosophy and psychological systems and practices. Often, this interface takes the form of a fundamental challenging of dominant paradigms within modern psychologies. Reductive theoretical systems and practices have come under serious critique utilizing Levinas' methodology. Furthermore, the nature of consciousness, subjectivity, the ego, and the relation between self and the Other are often the topics addressed in these conversations.

Modern psychologies have frequently functioned as an extension of Western philosophical frameworks and out of a long lineage of Greek thought. As such, the Greek emphasis upon generalization, universalization, rationality, and immanence remains the preponderant base of contemporary psychology. Consciousness and rationality have been emphasized alongside of naturalistic and universalizing depictions of selfhood.

Furthermore, the individual ego is often valorized, with individuation and independence as core goals of human flourishing (in Western psychologies). Language of coping, cohesion, adaptation, and integration are among the many descriptors of a higher functioning self within the world. Seldom are theories and practices developed that understand the self as a “moral event” or emergent from ethical interchange and justice. Some theories recognize the need for social interest (e.g., Alfred Adler) or interpersonal engagement (e.g., Harry Stack Sullivan) but are far from making ethics a “first philosophy.”

Levinas’ critique of Western consciousness and the Western ego as self-reflexive and transfixed with itself is a frequent theme throughout his work. His depiction of an ethically constituted self challenges the fundamental primacy of the ego and construes the ego as vulnerable and exposed to the calling of the Other. Psychological appropriators of Levinas’ work often accuse psychoanalysis, cognitive-behavioral theories, and a variety of other paradigms as being caught up in this “egology” wherein the monadic individual and his or her rationality, affective functioning, and behavioral repertoires constitute the human person. The Western ego, in Levinas’ thought, has become an idolatrous entity within which persons became trapped, preoccupied, and tormented. Persons cannot find escape from themselves. Levinas uses the story of Odysseus and his return to his homeland as an example of the prodigal and self-returning version of the ego in Western thought. In contrast, he describes the story of Abraham – who is exiled from his homeland and journeys to a land unknown – as an illustration of a self lived beyond the confines of itself.

Instead of freedom being understood as individuation, living congruently with one’s biological needs/drives or self-actualization, Levinas suggested that freedom is born from responsibility for the Other. Ethical interchange and moral attunement are more original than ontological expressions of personhood. Instead of the “I” being sovereign and imperial, it is a response to the imperative found in the needs of the Other. The ego is perpetually called outside of itself and into a selfhood beyond the practices and history of itself (sameness). Levinas utilizes the illustration of God commanding Adam into being at creation, thus showing that the self is first commanded before anything else.

The prophetic quality of Levinas’ work and the translation of Jewish ethics into contemporary systems of thought is poignant and a powerful corrective to dominant skews in modern, Western psychologies.

LGBTQI and Queer Studies

Kelby Harrison

Union Theological Seminary, New York,
NY, USA

In 1995, Lauren Berlant and Michael Warner wrote that the only way to capture queer theory is through “a kind of anti-encyclopedia entry” because “queer theory is not the theory of anything in particular, and has no precise bibliographic shape.” In the nearly 20 years since Berlant and Warner’s article, queer theory has taken shape – nearly having a canon. This rapidly growing discourse of subaltern, deviant, and/or minoritized expressions of sexual desire – what we usually call lesbian, gay, bisexual, or queer – and the rapidly shifting political environment increasingly allows scholars to ask and answer such questions in public forums without risking professional reprisal.

However, the canon of queer theory is a significantly different body of literature than lesbian, gay, bisexual, transgender, and intersex (LGBTI) studies, which in turn is different from LGBTI religious literature, queer theology, and LGBTI psychology. To create an encyclopedic entry of these disparate bodies of literature is to first capture the way in which they are intimately entwined with each other. First they are all anchored in the lives of LGBTI and queer identified persons (by self or by others; currently, previously, or in the future) and their plights for meaning-making in a broader culture that is often inhospitable to full flourishing. Second, religious intolerance and homophobia affects LGBTI psychology, identities, and health, while queer studies see queer expressions of sexuality and gender already deeply present in major world religions. Third, LGBTI positive psychology makes the reclamation of religion more possible for LGBTI persons. Fourth, the history of religious influence on sexual practice, sexual morality, and human sexual relationships is writ large in our contemporary culture and understanding of our selves. Take, for example, the strong rhetorical tension of the “culture

wars” that pins “the moral majority” against the “homosexual movement.” Finally, the deeply embedded religious assumptions and ideologies of those who have created the history of LGBTI and queer identities (e.g., sexology) are still a body of work that needs to be written – those assumptions teased out and demonstrated as intrinsically woven into our secular understandings of LGBTI and queer identities.

Queer Theory

The trinity of texts at the center of the queer theory canon are Michel Foucault’s *History of Sexuality*, v.1 (English translation – 1978), Judith Butler’s *Gender Trouble* (1990), and Eve Sedgwick’s *Epistemology of the Closet* (1990). Despite the 1976 French publication of *History of Sexuality*, the start date for queer theory is said to be right around 1990, the term having been coined by film scholar Teresa de Lauretis. Each text undoes an important cornerstone of assumptions of sexually and gender diverse individuals. Foucault’s *History of Sexuality* traces the influences for the possibility of modern discourses around deviant sexuality, arguing centrally that the repression of the Victorian era actually proliferated discourse around sexuality. Sedgwick’s *Epistemology of the Closet* argues in part that the closet functions as a control mechanism for everyone’s sexuality – it is universalizing, rather than minoritizing. Butler’s *Gender Trouble* argues that there is nothing natural about gender, rather all gender is simply a repetition of cultural scripts. Together these texts, now sacred as canon in their own right, work to deconstruct the most prevalent assumptions we have of sexual minorities: that our gender expression is somehow unnatural, that our sexual-social experience is fundamentally different, and that our sexualities are in opposition to prim and proper notions of sexual morality. Other key writers in this field include Anzaldúa, Haraway, Fuss, Berlant, and Warner. This emphasis towards the deconstructive is what sets queer theory apart from LGBTI studies.

LGBTI Studies

It can be casually, but rather unprecisely, stated that in the USA lesbian and gay studies began in the years just after the Stonewall riots. However, in Europe the date is much earlier, with the 1949 publication of Simone de Beauvoir’s *The Second Sex* with its robust chapter on “lesbians” – unquestionably an attempt to explain lesbians from a socially affirmative standpoint. She challenges the stereotype of a lesbian as a woman who wears mannish clothes and has a rough demeanor. Beauvoir writes about lesbian sex with a poetic tone. This kind of positive and affirmative explanation – which still concretely and realistically engages with cultural discrimination and stereotypes – is indicative of LGBTI studies.

Some 30 years later in the USA, key texts of LGBTI studies include Adrienne Rich’s “Compulsory Heterosexuality and Lesbian Existence” drawing a direct connection between patriarchal oppression and the displacement of economic, physical, and emotional energies of women towards men. David Halperin’s “Is There a History of Sexuality?,” investigating ancient world praxes of sexuality, arguing that ancient understanding of human sexual difference looked much more like natural dispositional variation of appetite than does our modern notions of identity constructive sexuality. Gayle Rubin’s “Thinking Sex” – which is a notable crossover piece into queer theory – and works by historian John D’emilio, anthropologist Esther Newton, and art historian Douglas Crimp all have a central and formative place in the field.

Transgender studies have had its own historical development. Once simply known as gender passing, the term “transgender” has gained significant popularity since the 1990s. It refers to people who live across the boundary of gender away from the gender they were born into. Typically if one has had sex reassignment surgery, the term utilized to describe his/her identity is “transsexual.” This term can be traced back to sexology in the late nineteenth century. Transgender rights began in 1975, with towns and cities nationwide beginning to adopt trans protective ordinances.

Discrimination of transgendered people is still very common, even by large gay rights organizations. Important writers in trans studies include Gayle Salamon, Susan Stryker, and Julia Serano.

Intersex studies focuses on the history of what was once called hermaphroditism and contemporary biomedical ethical issues. “Intersex” designates “a variety of congenital conditions in which a person has neither the standard male nor female anatomy,” endocrinology, or chromosomes. Currently, intersex is considered a medically treatable condition by the general medical profession, and surgeries are often performed on infants. Many of these children grow up to have serious sexual dysfunction and experience significant gender dysphoria. Intersex activists advocated changes within the medical profession based on biomedical ethics. Alice Domurat Dreger’s edited *Intersex in the Age of Ethics* is an excellent example of the genre.

LGBTI Religious Literature and Queer Theology

Queer theology is an attempt to reread or simply read theologies – often Christian – as already having embedded within them or having possibility for containing a queer sensibility. Examples include reading sexual and gender ambiguity into the trinity (e.g., Gavin D’Costa’s essay “Queer Trinity”), the experience of queer love in the metanarrative of Jesus as God-made-flesh (Patrick Cheng’s *Radical Love*), or the possible intersex identity of the body of Christ (Susannah Cornwell “Intersex and Ontology: A Response to The Church, Women Bishops and Provision”).

LGBTI religious literature explores traditional issues within religious social and community life, or passages with sacred texts, and attempts to find reconciliation for excised persons defined as sexually deviant or rereads texts with greater acumen and/or more favorable social interpretations. This genre can also take the form of personal narrative. Kathy Rudy and Robert Goss have both written elegantly in the latter category. One can also do a very smart cultural reading of rhetorical gestures and ideological frames that have become

contemporary politico-religious dialogue, such as Mark Jordan’s *Recruiting Young Love*.

Queer theology and LGBTI religious literature are not particularly dependent on queer theory or LGBTI studies. It is clear that the history of religious thinking has had a strong impact on the well-being of LGBTI people and has influenced the motivations and perspectives for doing research on LGBTI identity and behaviors. This relationship could be rendered much more visible in secular and religious scholarship.

LGBTI Psychology: History and Contemporary Models

Our modern intellectual history regarding homosexuality began in the late nineteenth century with sexology. Researchers such as Richard Von Krafft-Ebing and Dr. James Kiernan studied “perversions” and medically categorized deviants. Prior to sexology, the dominant sexual ideology privileged reproductive behavior as moral with all other types of behavior as immoral, a judgment strongly driven by religion. After the invention of homosexuality as an identity (coined in 1869 and reaching popular clinical usage by 1886) and the significant efforts of sexology to understand the contours of “deviant” sexuality, persons with opposite-sex sexual desire – heterosexuals – began to be understood as the healthiest of citizens, the ones who are natural and worthy of moral and psychological respect. Sigmund Freud, in his *Three Essays on the Theory of Sexuality*, had a strong influence in this regard.

Up to the 1950s, the struggle over homosexual identity remained mired in questions of psychological and biological health. As positive critiques of sexuality began to be produced, the pathologizing efforts of sexology began to fade. The first major change in this thinking was the Kinsey model (1948), which developed sexuality theory along a 7-point scale – on one end falls the pure heterosexual, on the other the pure homosexual. Most individuals fall somewhere in between.

Stage models have been popular in the contemporary psychology of sexual orientation. Vivienne

Cass (1979) is the most well known and uses six stages to explain gay identity development, which begins with confusion, develops through acceptance and pride, and ends in the synthesis of sexual identity into a larger understanding of self. Alan Dowds argues for a 3-stage model of gay male identity development: first shame, then compensation for shame, and finally authenticity.

Others have tried different kinds of frames. Anthony D'Augelli, for example, developed what he calls a "Lifespan Model" which he says is a fluid holistic lifelong process of identity development that involves five recognizable behaviors that are interwoven together and can occur at different and multiple times. Finally, there continues to be sex researchers who approach sexuality on a more complicated grid that mirrors the Kinsey approach. Fritz Klein, for example, used seven variables on grid to measure sexuality, all of which are superimposed on a time scale (past, present, future).

HIV/AIDS

The role that the AIDS crisis and HIV have had on the psychology, community life, and scholarly importance of everything aforementioned cannot be overestimated. The depth of the trauma of HIV/AIDS beginning in the early 1980s and its contemporary role in LGBTI communities have yet to be fully understood or integrated into our history, theory, and theology. It may be many years and generations before we can articulate the full impact. Important contributions to this discourse include Randy Shilts, Tim Dean, Castiglia and Reed, and the ACT-UP oral history project.

Conclusion

One of the most exciting aspects of these overlapping fields of study that all anchor themselves in the lives of LGBTI and queer people around the globe and throughout history is that there is still a lot of knowledge to be produced by scholars and clinicians. Those interested in studying and writing about such topics should be strongly encouraged.

LGBTQI Counseling

Elizabeth Maynard

Department of Pastoral Counseling and Spiritual Care, Loyola University Maryland, Columbia, MD, USA

Congregation Toras Chaim, Dallas, TX, USA

Counseling to address the needs of lesbian, gay, bisexual, transgender, queer, questioning, or intersex (LGBTQI) individuals may have a variety of foci. In addition to the exploration of predictable developmental and interpersonal concerns, counseling with LGBTQI clients often addresses additional stressors or conflicts experienced uniquely by sexual minorities and their families. These stresses may include coming out to family members, friends, or employers; health-related concerns such as conceiving or adopting children; assuring health benefits and legal rights for non-marital partners; beginning or continuing a gender transition for transgender persons; responding to harassment or physical violence; conflicts with families of origin; workplace discrimination; and spiritual concerns. The stresses experienced by sexual minorities, including internalized homophobia and homonegativity, have been linked to often underdiagnosed symptoms of depression, suicidality, substance abuse, and sexually compulsive behavior.

Some clients seek counseling because they would like to change their sexual orientation or gender identity. Clients may experience pressure from parents, spouses, or other family members to conform to more traditional or culturally expected gender roles or sexual behaviors. Other clients seek counseling because they would like to live more openly and comfortably as a gay, lesbian, or

bisexual person or to begin or continue a gender transition. Religiously committed sexual minorities may seek or be referred to counseling when their religious beliefs or faith community are not supportive of their sexual orientation or gender identity. These conflicts are particularly common among Evangelical Protestant Christians and Muslims, though these conflicts exist for clients of many faith traditions.

Of particular concern to mental health professionals is the question of whether or not sexual orientation and gender identity can be altered. That is, can a person whose primary emotional and erotic attraction is to members of the same sex (or both sexes) develop an exclusive or enhanced attraction to those of the other sex? Further, can a person who experiences an internal sense of disparity between her or his gender identity and biological sex develop a sense of congruence between identity and anatomy? At present, little evidence suggests that an individual's sexual orientation or gender identity may be significantly altered, though the choices that individuals make about sexual behaviors and adherence to social norms are often malleable. Thus, a gay or lesbian person may elect to participate in heterosexual sexual activities (just as a heterosexually identified person may participate in sexual activities with those of the same sex), without experiencing a fundamental change in the direction of his or her primary emotional and erotic attraction. So, too, a person who is biologically male may choose to dress and conform to the expected gender role for his cultural group while internally experiencing the self as female. However, consistently acting in a way that is different from one's sexual orientation or gender identity often creates anxiety, stress, and depression for the individuals who attempt to do so. Several professional organizations, including the American Psychological Association and American Counseling Association, hold the position that same-sex sexual behavior and attraction are normal variants of human sexuality, and the change of one's sexual orientation is, therefore, not a supportable goal for therapy. However, some mental health practitioners believe that sexual orientation can be changed and offer services designed to facilitate

change of sexual orientation (one form of which is known as “Reparative Therapy”).

Many clients come from religious backgrounds which limit sexual expression to heterosexual (usually marital) relationships and expect gay, lesbian, or bisexually identified individuals to commit to exclusively heterosexual activity or to choose celibacy. Additionally, few religious traditions, with the exception of some Native American traditions, have been supportive of gender transitioning among adolescents or adults. Religious LGBTQI adults often feel pressured to reject their sexual orientation or gender identity or to leave their religious community if they would like to be “out.” However, a growing number of religious communities and para-church organizations accept and support openly LGBTQI individuals without expecting heterosexual practices, celibacy, or gender conformity.

Many religiously committed sexual minorities have spent considerable time attempting to change their sexual orientation or gender identity. Clients often report intensive use of prayer and scripture reading in an effort to change what they view as sinful behavior. A small number of Christian clients have pursued exorcism in an attempt to banish a “spirit of homosexuality.” Some clients have adopted an image of God which is condemning and rejecting, believing that God finds their sexual orientation or gender identity intolerable and requires change from them. Others adopt an image of God which is loving, but may wonder why God would allow them to suffer discrimination from others. A smaller number of clients adopt the idea that they are made in God’s image. Religiously committed clients may also make decisions about being “out” within their religious community and daily life. Some individuals are “out” everywhere, while others may be “out” in one setting, but not another. Many religiously committed sexual minorities feel that they must choose between their religious commitment and sexual orientation or gender identity, a choice which often creates a loss of at least one essential element of the person’s identity.

Counseling of LGBTQI clients, like counseling offered to other communities of clients, focuses first on the presenting concern of the

client or client family. The clinician acknowledges that the client’s concerns may be related primarily to sexual orientation or gender identity, influenced partially by these factors, or have little to do with these aspects of identity. As an ethical practitioner, the counselor assesses whether or not she or he is competent to offer services to the client, negotiates treatment goals that are both consistent with the client’s values and supportable by research and professional practice standards, and makes referrals to allied professionals, as needed. The counseling may serve an individual client, a couple, or a larger family system. Counselors of many different sexual orientations and gender identities may be helpful to LGBTQI clients, often at different stages in the therapy process.

Counseling often focuses on the treatment of specific symptoms such as depression, anxiety, and substance abuse; improving interpersonal relationships between partners or family members; choosing supportive relationships; reconciling religious beliefs with dimensions of identity; and grieving losses of beliefs, communities, relationships, behaviors, or imagined futures (such as a heterosexual marriage, for some clients). Counseling may also focus on social justice and advocacy issues. Those who counsel LGBTQI individuals and families usually rely on established therapeutic modalities, including psychodynamic, cognitive, behavioral, humanistic, family, and systems approaches.

Liberation Psychology

Daniel J. Gaztambide
Union Theological Seminary Program in
Psychiatry and Religion, New York, NY, USA

Liberation psychology is an umbrella term for a cross-disciplinary movement in psychology which originated in Central and South America as a response to grievous social injustice, civil war, and political turmoil. It is most often associated with the work of Jesuit priest and social psychologist Ignacio Martín-Baró (1942–1989) in El Salvador. Although he is often credited with popularizing the term in social and community psychology, it was “coined” and employed independently by Nancy Caro Hollander in her assessment of the progressive social justice initiatives of psychoanalysts who integrated the psychological insights of Freud with the social and economic analysis of Marx.

Liberation psychology is a broad movement in psychology comprised of multiple schools with different cultural and ideological origins. It is perhaps most often associated with the work of Jesuit priest and social psychologist Ignacio Martín-Baró (1942–1989) in El Salvador, who called for a psychology which relinquished its aspirations for social, political, and “scientific” prestige in order to make “a preferential option for the poor,” those people who are oppressed by

unjust social conditions and political regimes. This liberation psychology entailed a fusion of liberation theology, the political analysis of psychology from critical psychology, Paulo Freire’s radical pedagogy, and the methodological tools of social psychology. The social ethics and theological assertions of liberation theology in particular were of great import in the development of Martín-Baró’s thinking, who maintained a close relationship with renown liberation theologian and philosopher Ignacio Ellacuría.

Three tenets of liberation theology crucial to Martín-Baró’s development of liberation psychology were the belief in a God of life and justice who scorned oppression, the importance of orthopraxis over orthodoxy, and the preferential option for the poor. Using these three principles Martín-Baró proposed three essential elements of liberation psychology: a new horizon by which psychology would not concern itself with maintaining a privileged political or social position but with employing itself in the service of the poor and oppressed, a new epistemology that attempts to understand psychological dynamics from the perspective of the dominated poor Salvadorans instead of the perspective of the dominant elite, and a new praxis by which knowledge and research developed from the perspective of the oppressed then becomes used to empower them by developing critical consciousness regarding their psychosocial-political reality (*concientización*), in order that they may liberate themselves and change that reality. Given these elements, Martín-Baró outlined for liberation psychology three urgent tasks. Firstly, there needs to be a recovery of historical memory, by which one discovers those behaviors of the past which instill a sense of collective identity and help an oppressed community survive and struggle toward liberation. Secondly, there needs to be a de-ideologizing of everyday experience through the subversion of dominant narratives by psychologists participating in the life of the poor, recovering their experience and “returning” it to them, so that they may reflect upon it and form a broader consciousness of their reality. Thirdly, psychologists in El Salvador should shun the importation of ethics, cultures, and values alien to the

country's people and instead use the people's own values and virtues as represented in the cultural, social, and religious institutions that have aided in their survival during the civil war and struggle toward social justice.

Using this liberation psychology, Martín-Baró developed social psychological research projects that aimed to understand phenomena as varied as the effects of war on mental health (especially that of children), the psychological dynamics of state terrorism and oppression, the ways that psychology can collude with or go against the status quo, the use of religion as an instrument of psychological warfare, and the experiences of the Salvadoran people in the midst of social and political violence. This research was not simply published in academic journals but was likewise used to develop critical consciousness (*concientización*) among the Salvadoran people. Due to the political implications of this perspective for psychology and Salvadoran society, Martín-Baró was murdered in 1989 along with seven others on the campus of the Central American University in San Salvador. His vision, however, lives on as it has influenced many social and clinical psychologists in Latin America, North America, and Europe.

Parallel to the development of Martín-Baró's thinking, in 1981 the North American psychoanalyst Nancy Caro Hollander became interested in the work of Marie "Mimi" Langer (1910–1987) and other psychoanalysts in the Southern Cone countries (Argentina, Chile, Uruguay, Paraguay, and Brazil) who also struggled against unjust political regimes, by relating psychoanalysis and Marxism in both theory and clinical practice much in the same way that liberation theology had related theology and Marxism in liberatory reflection and praxis. Hollander worked with Marie Langer and her colleagues clinically and academically and, as a result of their relationship, subsequently began writing a group biography detailing their life and work in the midst of war and oppression. In that biography, it was detailed how Marie Langer and many of her colleagues had originally migrated from Europe to South America due to the growing threat of Nazism to Europe and toward their communist and Marxist political

views. Much like their counterparts in North America, in South America Langer and other migrating psychoanalysts initially found it necessary to keep a low profile on their Marxist ideologies for fear of retribution from more conservative colleagues and the local right-wing governments.

As conditions in Latin America continued to deteriorate due to civil wars, revolutions, and economic-political oppression, psychoanalysts began to speak out against injustice and take steps to both make sense of the escalating conflicts psychoanalytically as well as develop treatment relevant to the needs of oppressed and displaced people, hence making a preferential option for the poor people of Latin America. Freud's theories concerning the intrapsychic dynamics of repression, splitting, and projection were related to Marx's theories regarding the repressive and alienating dynamics of economic and structural injustice. The function and role of an overly harsh and persecutory superego likewise became contextualized and related to the imposition of the bourgeoisie morality and right-wing politics of the governing classes. The work of Melanie Klein in particular became very influential in understanding how human destructiveness was affected by interpersonal, economic, and societal dynamics, such as genocidal ideologies molding everyday poor people into soldiers for the all-good regime against the all-bad civilians or insurgents (in many cases seen as one and the same).

In clinical practice, social justice-oriented psychoanalysts in Latin America would contextualize developmental (oedipal, preoedipal) difficulties and mental illness in the historical economic and political oppression that their patients' experienced in society and through family life, providing interpretations that would encourage them to speak and give voice to their psychosocial trauma. Apart from individual treatment, Langer and others also practiced group psychotherapy as a liberating practice, providing a much more socially relevant service extending mental health services to wider communities in need of support. A variety of pragmatic methodologies were developed in relation to the social ambivalence that surrounded treatment with particular clients

(whether it was working with a torturer, a victim of torture, or an insurgent), including encouraging patients to become politically active in order to give voice to their fears and anxieties, a move that was found to be clinically useful in helping the healing process, as well as inviting patients to work toward changing their social reality. Due to such consciousness raising and revolutionary clinical work, Hollander used the phrase liberation psychology to describe the labors of social justice-oriented psychoanalysts like Marie Langer, a use that was reinforced after she found that Martín-Baró had coined the phrase earlier to describe his social psychological work in El Salvador.

Commentary

A liberation psychology of religion would be concerned with the ways that religion could be a force of prophetic and critical consciousness for social change or a tool of psychosocial domination upholding the interests of those in power. In the specific case of El Salvador, Martín-Baró was concerned with a model of intervention the United States had developed known as “low-intensity conflict,” which emphasized sociopolitical psychological warfare which sought to “win the hearts and minds” of the people who supported the insurgency against the US-backed regime. It would pursue this goal through the use of propaganda, harassment, sanctions, and even torture to make people feel insecure about their basic beliefs and shift political orientation in favor of US interests in the region. Religion, as a central institution for many Salvadorans, enters the picture as one possible tool of such psychological manipulation.

In a series of studies starting in 1984, Martín-Baró and his colleagues did empirical research on the relationship between different types of religiosity and sociopolitical attitudes, which compared Catholic Christian Base Communities (groups that use the perspective of liberation theology to reflect upon their spiritual and material conditions in order to organize social justice efforts) to converts to Evangelical

Pentecostalism and charismatic Catholics. These studies took place during a time in which North American evangelical churches intensified missionary efforts into the area, thanks in part to the support of conservative political groups in the USA. It was found that while the Catholic Christian Base Communities displayed a “horizontal” religiosity which emphasized God among the people working toward a more just society, the church as a prophetic voice in society, and the war in El Salvador as a result of structural injustice which must be responded to by a socially active church, evangelical Pentecostals and charismatic Catholics alike displayed a “vertical” religiosity which emphasized God as mysterious and distant and the church as a house of prayer apart from society, with the war a result of man’s sinfulness and divine will, which will end only by praying to God and asking for mercy. As a result of these respective theologies, “horizontal” religiosity tended to lead people from the Christian Base Communities to become conscious of their social conditions, to organize and mobilize in the interest of social justice, and to have more progressive views on child-rearing, education, work, and politics, while “vertical” religiosity tended to legitimize the policies and behaviors of the government as inevitable and necessary, to become complacent and conforming to the status quo, and to have more conservative views on child-rearing, etc. Type of religiosity, then, was tied to sociopolitical attitudes which either maintained or brought into question the policies and ideologies of oppressive political regimes.

A more psychoanalytic approach to a liberation psychology of religion would attempt to correlate the effects of the different types of theologies and religiosity on the psyche and the way that particular religiosities organizes the psyche are related to the economic and power structures of society. For example, one could take James W. Jones’s study of how religion can be both a source of terror and violence or revelation and transformation and relate that analysis to a social analysis of political power. If what Jones calls fanatical religion fosters deep psychological splits in the self between “good” and “bad,” with

all the good projected onto an over-idealized God image and all the bad projected outside into groups designated as “other,” it carries the potential of infantilizing adherents before an awesome and magnanimous parental figure, rendering them submissive and unable of exercising critical thinking in relation to other idealized figures, such as the state, an ethnic group, patriarchy, or a nationalistic identity. The over-idealized social institution may then invoke such sentiments to maintain a particular social order and label those who would upset that social order as enemies who must be silenced or destroyed. Alternatively, Jones also refers to religion’s transformative capacity, its ability to create a space from which new insights and truths may emerge in new permutations of consciousness through a relationship – not of submission but of surrender – to a teacher, a text, an empathic community, or a spiritual practice. This transformative function may liberate the true self and allow space for a critical voice to develop which may be able to de-idealize and critically examine the structures of power and politics within religion, culture, and society. This process may initially be deconstructive as one breaks down the over-idealization of God-images, the ethnic group, or the state, but may also become constructive as new idealizations and permutations of religious experience may emerge from within a de-idealized void. New conceptions of religion may arise with a prophetic vision of a more just society.

Liberation Theology

Daniel J. Gaztambide
Union Theological Seminary Program in
Psychiatry and Religion, New York, NY, USA

Liberation theology is a Christian theology that originated in the Latin American Catholic Church in the 1960s, but which can today be found around the world in North America (e.g., Black Liberation Theology), Africa (e.g., African Women’s Theology), and Asia (e.g., Minjung

Theology). In Latin America it grew out of the efforts of Catholic priests who related theology to Karl Marx's theories of social analysis in order to become more socially conscious of the conditions of political and state oppression and to relate theological reflection about the nature of economic and social oppression to the needs of the Latin American poor for social justice. Considering God to be a God of justice and Jesus as not only the savior of mankind but the liberator of the oppressed, liberation theologians lived among the poor as an act of solidarity, making a preferential option for the poor and protesting the unjust conditions that afflicted them through political activism, community work, and academics. Liberation theology has also been of interest to social justice-oriented mental healthcare workers, inspiring not only a variety of liberation psychologies (i.e., the work of Ignacio Martín-Baró, Mary Watkins, and Lawrence Alschuler) but also an integration of liberation theology and pastoral care (e.g., the work of Stephen Pattison).

Libido

Jo Nash

Sri Lanka International Buddhist Academy,
Kandy, Sri Lanka

Libido is a term used in psychoanalytic psychology to denote the fundamental sexual energy of the human organism, either a sexual “instinct” or “drive” which in simple terms compels us to reproduce the species. In Freud's economic theory of the psyche, libido is proposed as the sexual source of all mental energy, which flows towards objects of our attention, thereby investing them with interest or *cathecting* those objects. In this way, libido establishes a psychic relationship with the object whether in fantasy or reality. The sublimation of

libido into creative activity is the source of civilization for Freud, achieved through the complex processes of displacement of sexual energy away from the gratification of our individual desires, towards servicing the wider purposes of the social groups and institutions to which we belong.

Freud also described how libido cathects zones of the body during the early life of the child in phases called the oral, anal, and genital stages of development. These different stages evolve as the child's awareness and interest are invested in progressively more complex activities focused on different parts of the body, beginning with the mouth during feeding and then the anus during potty training, before moving onto the genitals, which continue to absorb more and more attention and interest into adulthood.

For Klein, however, her clinical work with children revealed that the development of these phases was not as staged as Freud proposed but that at any time from early life onwards, a mixture of these phases of interest could be observed, with some impulses prevailing over other impulses at different times, in order to defend the infant, child, and later adult against primitive anxieties of a sadistic nature. Hinshelwood writes:

...the sequence of dominance was the effect of the sadism, the fear of retaliation, and the anguished wish to restore damage. [...] She also thought of the genital phase as a particular upsurge of libidinal feelings, and that there may therefore be a precocious surge towards the genital phase as a reassurance against the sadistic impulses of the pre-genital phases. (Hinshelwood 1989, pp. 338–339)

In other words, the premature development of genitally focused sexual activity may indicate that deeper impulses of oral and anal aggression are being warded off by the child, out of a fear of retaliation for the harm the expression of these impulses might cause. For Klein, libido pervades all object relationships channelled through various erotogenic zones of the body at various levels of intensity from early life to death. Libido is depicted as something of a rapacious, greedy, and visceral force fundamental to the presence of life and its complex quest to sustain itself.

In the analytic psychology of Jung, however, the term “libido” is deployed to denote a more generic psychic energy or life force that propels

the personality towards individuation through the enlargement of the “self.” For Jung, libido has a spiritual dimension which did not exist for Freud or Klein. In this way, Jung proposes that libidinal energy is invested in all forms of intentional activity, from individual developmental “tasks” such as symbolism and the acquisition of language to increasingly complex creative activities, including art, science, and religion, that aid increased psychological and spiritual integration. Libido is depicted as a benevolent force which invests both subjectivity and the world around us with the intentional activity of life itself.

Lilith

Chani Nicholas
San Francisco, CA, USA

Lilith is an ancient Near Eastern Goddess who reaches into ageless archetypal fears of the night, death, and the wild, untamed natural world. She

shows herself in Sumerian, Babylonian, Assyrian, Canaanite, Persian, Hebrew, Arabic, and Teutonic mythology. She is known as a longhaired night demon, child-killing witch, succubus, wind-spirit, seductress, bloodsucker, Impure Female, End of Day, screech owl, or hag. In Hebrew mythology she was the first wife of Adam and the manifestation of the rejected and disembodied shadow of the Great Goddess rejected by the monotheistic, patriarchal Hebrews (Koltuv 1986). Lilith lives in the wild and is close to nature – she is depicted as having hairy legs like a beast, sometimes winged with talons for feet, reminding us of the nocturnal wisdom of the bird Goddesses before her (Johnson 1988). She is a balancing force to the all-powerful solar God who is divorced from the earth’s sensual nature. As with all ancient figures in mythology, she has gone through many incarnations. She has been used by the patriarchy to exemplify the punishment dealt out to any woman who is autonomous and awakened to their female sexual power. Jungians call her our unincorporated female *shadow* for she, and figures like her, becomes a basin for humanity to deposit our collective fears of the dark.

Lilith originated in Sumeria as the Great Assyrian Goddess Inanna’s handmaiden. It is said that Lilith collected people from the fields to participate in sexual rites in the holy temple at Erech. These rituals belonged to the Goddess and were central to the culture of the time, initiating participants into the mysteries of Her ways. Inanna was primarily a lunar deity, and her mythologies were reflective of the phases of the moon. The importance of these cycles and their interpretations are central to understanding how people’s consciousness was oriented at this time. The mysteries of life, death, and regeneration hung on the appearance and disappearance of this light in the night skies. In pre-patriarchal myths of Goddess, the moon’s waxing was a symbol of Her ability to give life, balanced by the moon’s waning, symbolizing Her inevitable cycle of death that followed. Death in this context was understood as a necessity, for life is predicated on death. This life-giving and life-taking cycle of the moon is mirrored in the earth’s seasons of summer abundance and winter dormancy. Around the world, like Kali in India, the Goddess was whole, dark

and light, a reflection of life in the big picture (Baring and Cashford 1993).

The Babylonian hero Gilgamesh and his solar ways eventually drove Inanna and Lilith apart. Lilith appears as a demon living in the *huppulu* tree that Inanna cared for. Inanna was to make her bed and throne out of it, but when she visits the tree, it is filled with frightful beings: the demon Lilith, a serpent, and a bird, all images of female power. Gilgamesh cuts down the *huppulu* tree with his sword of masculine rational thought and aggressiveness, forcing Lilith to destroy her home and flee into the “wild, uninhabited places” (Gadon 1989). This myth prepares for the dismantling of powerful, autonomous, self-seeding Goddesses such as Inanna and for the future demonization of Lilith by patriarchal religions (Gadon 1989).

In the Jewish *Zohar*, a Kabbalistic work of the thirteenth century, there is an origin myth of Lilith’s that depicts how God diminished the moon’s importance to being primarily a reflection of the sun’s luminosity. Similarly:

God thereupon said to her, ‘Go and diminish thyself.’ . . . Thereupon she diminished herself to be head of the lower ranks. From that time on she had no light of her own, but derives her light from the sun. At first they were on an equality, but afterwards she diminishes herself . . . she reduces her status and her light, and shells upon shells were created for covering the brain . . . After the primordial light was withdrawn there was created a ‘membrane for the marrow,’ a *k’lifah* husk or shell, and this *k’lifah* expanded and produced another who was Lilith (*Zohar* I 19b, as cited in Koltuv 1986).

This is an obvious psychological repression and symbolic split of the organizational powers of the universe – a formal indoctrination of a dual system where the solar male God and his rationality are posited as psychologically and politically superior to the lunar female Goddess, and her twilight mystery Lilith is born from this split, deriving “her energetic force from opposition and suppression” (Koltuv 1986). However, the text goes on to explain the importance of these images in the process of truly understanding the “radiance that cannot be comprehended” (*Zohar* I 19b, as cited in Koltuv 1986), as if these are protective layers of the rationalist ego that can

help patriarchal monotheists along the path of self-realization. The solar patriarchal Jewish consciousness suppressed and demonized shadow goddesses, such as Lilith, in a centuries-long effort to elevate the monotheistic Hebrew Yahweh to absolute goodness, separate from all earthly processes and darkness.

Creation stories of Lilith as the first wife of Adam tell how God “took filth and impure sediments from the earth, and out of these he formed female. As was to be expected, this creature turned out to be an evil spirit” (Patai as cited by Baring and Cashford 1993). Lilith refuses to lie beneath Adam submissively during sexual intercourse, demanding that they are on equal footing since they are both made from earth. Adam rejects her. But rather than conform, Lilith speaks the unutterable name of god and flies off into the far reaches of the desert “to a cave on the shores of the Red Sea” (Alpha Beta Ben Sira, as cited by Koltuv 1986). Rather than hand over her sovereignty, Lilith chooses dominion for herself, defying patriarchal law and forging her own path in the desolate wilderness. She is the wild spirit of nature within us that cannot be tamed. She refuses to be bound in relationship that will only relegate her to whipping post for Adam and Yahweh’s hatred of her regenerative sexual wisdom. Lilith teaches us that isolation and peripheral living is a necessity in finding out who we are. Lilith teaches us how to find our way through the dark. Psychologically, she brings to consciousness more meaning than the moralistic solar divinities that suppress natural forces. As Jung taught, there is gold in the shadow that we ignore at our peril. Today, we are seeing the return of the repressed in feminism, depth psychology, and ecology – urgently needed expansions of collective consciousness.

Once cast out of the Garden, Lilith becomes the night demon who will give men and women erotic dreams. It is said that one should not sleep alone, for fear of Lilith appearing in the night, arousing our suppressed sexual longings. Lilith is a gateway for our sexual autonomy and represents the uroboric wholeness that is in direct opposition to the concept of monogamy that monotheism instated. She is depicted as a psychological shadow in patriarchal moralistic repression – a

semen-stealing witch who uses the spilled seeds of men from their sexual dreams to spawn 100 demon babies each night (Johnson 1988).

Lilith is a powerful indestructible force that not even God can remove. After she flees Adam, she reappears as the snake that tempts Eve with the apple from the tree of Knowledge. In art it is often depicted as a serpent with the head of a woman or a woman with the tail of the serpent (Baring and Cashford 1993). Lilith and Eve are inextricably linked, for they are two sides of the same Great Goddess, and she will not let her sister remain innocent in the Garden. Like Persephone eating the pomegranate seed from the underworld, Eve too must taste the scope of life and assimilate knowledge, like an innocent child that must inevitably grow up psychologically and know complex adult consciousness, including sexuality.

In stark contrast to Eve, the mother of all creation, Lilith is portrayed by patriarchal myths as a child killer to be warded off by charms and amulets (Koltuv 1986). It could be said that collective rejection of Lilith is activated, surfacing in the minds of some women who experience postpartum depression, having fantasies of abandoning or harming their children – for someone must feel the repressed collective fears. Myths of Lilith as baby killer and strangler are a distortion of her energy, but the imagery also informs women that in the search for our individuation, we must release the infantile desire to be loved by everyone, to be adored and accepted. When we identify only with Eve, only with the sweet, docile, wife, and mother, then Lilith will eventually erupt unconsciously within us. We can see this enacted through the modern-day experience of PMS. When women bleed every month, there is an opening to get in touch with our inner Lilith. Many women are repelled by their own bodily and psychological shadows, and, instead of using these experiences as a point of transformation, such women are encouraged by patriarchy to be ashamed of the fluctuations of our bodies. But getting past this, as in psychotherapy or feminist circles, can bring a deeper knowledge of feminine wholeness in the gift of life-giving, too long hidden in shadow. Perhaps, when we are broken down physically just enough to feel our own

desires to flee and be in solitude or seek help – perhaps this is the only time Lilith is allowed to reveal herself.

To speak of Lilith is akin to trying to capture the wind, for often she flees from our voice, our mind goes blank. She has been so long repressed and demonized that she does not want to be pinned down or even understood. Our inner Lilith needs to have a say, a voice, or she will shriek at us or through us, like the screech owl she is named after. Lilith is the part of our nature that needs to be wild, untamed, sexually animated, whole, and natural.

Liminality

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Origin

Liminality is a term used to describe the psychological process of transitioning across boundaries and borders. The term “limen” comes from the Latin for threshold; it is literally the threshold separating one space from another. It is the place in the wall where people move from one room to another. Often a door is placed across the threshold to close up and restrict access between rooms. The concept was first applied to psychology as the technical name for the perceptual threshold, the degree of stimulus intensity that would just be noticed as audible or visible or detectable in any sensory mode. But its contemporary usage comes from the anthropologist Arnold van Gennep (1873–1957). In his study of religion as a cultural artifact, he saw that many, if not all, of the rituals across cultures have the function of moving a person from one status or social circumstance to another. His major work, *Rites of Passage* or *Les Rites du Passage* in the original French (1909/1960), sets out the thesis that at a psychological and cultural level, religion and its rituals give us the means by which we cope with change, whether it be from childhood into adulthood, from single to married, and from lay to clerical, and to mourn the loss of a beloved as they transition from this world to whatever lies beyond. His student Victor Turner (1920–1983) expanded upon van Gennep’s analytic framework and integrated it into role theory and the relationship of social action to drama.

Psychological Liminality

As a psychological capacity, liminality is the ability to bridge between self and the other. At an interpersonal level, this is called empathy. We come to know the other by entering into their phenomenological space to some degree. We begin to see things from their perspective. At the level of social groups, it can be described as the capacity for moving toward an insider’s perspective. Pike (1954) coined the terms “emic” and “etic” to refer to the insider’s and outsider’s perspectives with respect to language, and this now has been broadly adopted in cross-cultural psychology for the knowledge of any social group. So liminality with respect to social groups is gaining the knowledge that approaches what an insider would have; we bridge the gap between our own groups and those of the other. Both the interpersonal and the group levels of liminality require us to see and appreciate the other and to find bridges that would allow harmonious relationships as opposed to conflict. Liminality, therefore, is a requirement for any effective interpersonal or intercultural communication.

At the intrapsychic level, liminality is the capacity to move within and between the boundaries of one’s psychological structure. Lewin (1936/1966) first used the metaphor of space in his topological psychology, defining life spaces and discussing the relative permeability of the boundaries between areas of the person’s experiential world. At one extreme, one has the rigid compartmentalization characteristic of dissociation and multiple personalities; at the other is the failure of boundaries found in borderline personality disorders and termed “confluence” in Gestalt therapy.

In a spiritual sense, liminality is traveling between the world of spirit and the mundane world. This is the path of the shaman both in historical and current traditions. The shaman mediates between the two realms of being in service of the person seeking healing in the mundane realm. Modern shamanic approaches to healing also use this liminal skill of travelling between the worlds as a means of connecting the spiritual to the psychological.

Joseph Campbell's (1949) *The Hero with a Thousand Faces* was much influenced by van Gennep's basic outline of the threefold structure of liminal processes: preliminary, liminaire, and postliminaire. He took the concept and applied it to the transitional phases between the beginning and the end of a journey or transformational process. Liminality is the process of going in between two states and the time spent in that transitional zone when one is neither one nor the other but in the process of becoming. Liminality is the journey of transformation.

Finally, the therapeutic process is itself a literal rite of passage. We can view the relationship of therapist and client as a process of helping the client move from a state of unhappiness to some greater degree of either internal peace or interpersonal harmony and adjustment. The role of patient arises out of the medical role, part of a complementary pair, physician and patient. The various sessions within the relationship, whether in brief therapy or long-term dynamic work, are each small steps in the ritual of healing. Liminality describes any process of transformation from one state of being to another in human society; it is a key psychological concept.

Linguistic Harmony

Amitabh Vikram Dwivedi

College of Humanities and Social Sciences – Languages and Literature,
Shri Mata Vaishno Devi University,
Katra, India

Introduction

Linguistic harmony and respect for other languages have always been a well-cherished notion celebrated by Indians. Kabir Das, an Indian medieval saint, says in one of his couplets: people should speak in such a language which not only makes them happy but also others who listen to them. Further, in another couplet, he says that speech is priceless and one must think twice before speaking anything (Kabir ke Dohe 2018). There are more than 19,500 rationalized mother tongues – both classified and unclassified – spoken in India (PTI 2018), and multiculturalism and multilingualism is the heart of Indianness. Therefore, there is no national language in India, and Indians proudly celebrate the linguistic harmony among cultural diversity. Though Indians are overwhelmingly Hindu in religious affiliation or belief, yet India promotes the recognition, appreciation, celebration, and preservation of social difference. This chapter will discuss the psychological and religious aspects of linguistic harmony.

Discussion

In India, different religious faiths use different languages and scripts, such as Nagari and Sanskrit scripts are identified with Hinduism, Perso-Arabic script with Urdu language is identified with Islam, the Pali and Prakrit are identified with Buddhism, Gurmukhi script with Punjabi is identified with Sikhism, and Roman script with English is identified with Christianity (Pattanayak 1991). Many western thinkers often wonder how with so many cultural and linguistic differences India unites as

a nation. The psychologists confirm that people commonly tend to make mistakes and exhibit inaccuracies about communities and their social world. Linguistic harmony in India is not a recent phenomenon, and scriptures inform us that legendary Hindu sages and leaders have harmonized people instead of dividing them into linguistic ghettos (PTI 2018).

The *Thirumanthiram* provides a description of Agasthya as a Vedic sage who migrated from the North India and settled down in the Pothigai mountains because Lord Shiva instructed him to do so. Agasthya *Rishi* became a symbol of national integration, linguistic harmony and cultural learning as he perfected and loved both Sanskrit and Tamil languages. The settling down of Agasthya *Rishi* in the down South is also mentioned in the form of a humorous narrative in the *Skanda Purana*. The story goes like this: the entire creatures of the world visit the Himalayas to attend Lord Shiva's wedding, and this causes the planet Earth to tilt to one side. Then, Lord Shiva requests Agasthya to go southward to restore balance. Also, at one place it is mentioned that Agasthya *Rishi* stops the Vindhya mountain from growing up merely by pressing it down with his toe (The key to linguistic 2019).

The narratives in the *Thirumanthiram* can also be interpreted as an allegory to linguistic harmony: learning new language is not only a cognitive activity but also associated with the psychological growth of a learner. Wright and Tropp, the psychologist duo, argue that bilingualism promotes respect for the out-group because it signals the value and status of the minority language: both groups are given equal status and value (Wright and Tropp 2005). Since Hinduism is a tradition of tolerance and compassion, the majority of Hindus have never posed a threat to minority communities. Instead, Hinduism is accepting diversity and ending of divisions (Pattanayak 1991). A Sanskrit phrase, *Vasudhaiva Kutumbakam* "world is a family" found in the *Maha Upanishad*, encapsulates it: a wise person treats the entire world like a family, and remain detached and magnanimous, he lifts up his mind and enjoys the fruit of Brahmanic freedom (Warrier 1953).

Lingusitc Sound and Religion

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

Religions across cultures believe in the realization of inner sounds. For them, this is a necessary condition for the development of spiritual path. Scriptures too provide textual references to it worldwide. Also, it is believed that inner sound is a manifestation of Almighty who is indescribable and unnamed. Many universities, such as Auburn University at Montgomery, offer a major

in Psychology at AUM, and they claim that the learners will develop critical skills and learn to conceptualize problems. In AUM, two vowel sounds and one nasal sound represent a corresponding psychological state. Interestingly, religions express the Supreme Being using different linguistic expressions: Hu (in Sufism), Tao (in Taoism), ॐ Aum (in Hinduism), Shabd (in Sikhism), Allah (in Islam), Father (in Christianity), and alike. Based on the number of followers, there are three religions, namely, Hinduism, Islam, and Christianity which are considered major as compared to lesser populated religions. Interestingly, we find the same sound units, i.e., nasal and vowel sounds for expressing the Almighty in major religions. In Christianity and Islam, we have two nasal and two vowel sounds in the word “amen” and “amin,” respectively, whereas in Hinduism, we have two vowel sounds or a diphthong and a nasal as in “aum.” The remainder of the article will discuss the linguistic sound “Aum” of Hinduism.

Discussion

The three letters of AUM correspond to three psychological states: waking, dreaming, and dreamless sleep.

The *Mandukya Upanishad* explores three psychological states of consciousness and describes AUM as a sound blend of profound psychological reflections in all of Indian religious philosophy. To know waking, dreaming, and deep unconsciousness is to enter into the life of the psyche (Williams 2008, p. 313). Other religions such as Jainism, Buddhism, and Sikhism also revere and recite Aum. This linguistic sound is used in meditation, ritual, and recitation across many south Asian religions so much so that it has become ubiquitous. A phonetic analysis of the linguistic

sound used in the majority of religion indicates that there is a vowel sound [a] and a nasal sound [m], showing the stretch of mouth-from larynx to lips. The back of the mouth and throat is responsible for the production of the vowel [a], whereas nasal [m] is a bilabial sound. Since between [a] and [m] all audible sounds are produced, the followers of Hinduism generalize that the sounds [a], [u], and [m] encompass all sounds, all words in human language. Moreover, three sounds [a], [u], and [m] also represent three Vedas, namely, Rig, Yajur, and Sam Veda, respectively. Also, these sounds represent Hindu trinity-Brahma, Vishnu, and Mahesha. Further, elements such as water, earth, space, air, and fire are associated with them indicating good and evil qualities. According to *Taittiriya Upanishad* whatever exists in this universe is simply Aum (Table 1).

The origin of Aum is as old as Hinduism. According to Shankara, Aum is prior to everything, and it is the audible realization of the absolute reality. The Sanskrit phonology informs us that the single mantra is made up of [a]-*akar* (shaped things), [u]-*ukar* (shapeless things), and [m]-*makar* (neither shapeless nor shaped things), and *ardhmantra* (monosyllable), *bindu* (dot), *nada* (sound), *kala* (crescent), and *shakti* (energy). The *Chandogya Upanishad* employs the metaphor of spear to discuss the significance of Aum: It says as leaves can be held by a spike, similarly all things in the world are held together by Aum. According to *Bhagavadgita*, when someone utters the single syllable Aum the soul that departs from the mortal body mingles with the indestructible Brahman. The threefold division of time represented by ॐ Aum, i.e., past, present, and future, is actually three distinct psychological stages of mind: [a] the conscious state represented by the large lower curve; [u] the dream state represented by lower curve; and [m] represents deep sleep through the upper curve.

Linguisitc Sound and Religion, Table 1 AUM and its sound representation

Sound	Veda	Elements	Trinity	Time	Quality
A	Rig Veda	Water; earth	Brahma	Past	Rajas “passion, active, confused”
U	Yajur Veda	Space; air	Vishnu	Present	Sattva; “goodness, constructive, harmonious”
M	Sam Veda	Fire	Mahesha	Future	Tamas; “darkness, destructive, chaotic”

Furthermore, the *bindu* “dot” represents the fourth state of consciousness also known as *turiya* (in verse 7) and the absolute. According to Radhakrishnan, it is “the spiritual state of consciousness” (p. 695). The vowels and nasal sounds comprising AUM have not only a spiritual role but also have deep psychological meaning, and therefore chanting AUM is practiced both in the East as well as in the West; however, as once predicted by C. G. Jung, the Westerners have commoditized the AUM, but in the East it has much religious significance.

Lived Theology

Todd DuBose

The Chicago School of Professional Psychology,
Chicago, IL, USA

Lived theology is a phrase that describes a process more than an academic discipline. Our lived theology is the enactment of that, which is most significant to us at any given moment and as lived out in our everyday existence, rather than the systemization of creedal propositions of any given faith tradition. Borrowing from the thought of both the philosopher Martin Heidegger (1889–1976) and the theologian Paul Tillich (1886–1965), and others who have furthered

their thought, such as Langdon Gilkey (1919–2004), one’s lived theology is one’s “enactment of significance” in the world.

Theology, or speech about the divine, is traditionally seen as an academic discipline in which authoritative sources are interpreted and subsequently inform various doctrines and practices respective to one’s religious tradition. Lived theology is phenomenological in nature, and is aligned with existential, empirical, and phenomenological traditions that view the divine as an experiential phenomenon. The divine is not considered as an *object* of experience, but a *quality* of experience related to living out significance in the world, a living out of what matters most to one in any given situation. In this way, lived theology is not an exclusive property of elite academicians, but an existential of every human being. Hence, if human beings enact significance in every moment of their lives and if we understand *lived* theology as those enactments of significance, we can conclude, therefore, that to be a human being *is* to be a theologian. The human being is *homo theologicus* (DuBose 2000).

To be alive is to enact significance. Theological discernment from this perspective views how one is comporting oneself in one’s everydayness as disclosing what Tillich called one’s “ultimate concern” (Tillich 1952). These ultimate concerns, or as I call them enactments of significance, are not cognitively “thought out” propositions described in abstract, traditional religious discourse, but chosen ways of being-in-the-world. Agency inherent in comportment is lived out long before thought about. Such comportments are “pre-reflective,” as Maurice Merleau-Ponty (1908–1961) argued (Merleau-Ponty 1964). This perspective privileges a different knowing prior to cognitive reconsideration.

Given these premises, enactments of significance are known only after the fact or only when reflecting on comportment as it is in operation or having just passed. Life is lived rather than objectified, as the French radical phenomenologist, Michel Henry (1922–2002), proposed (Henry 2002a). Moreover, when enactments are translated into conceptualizations, such as when an experience of the numinous is translated as “an

encounter with the Holy Spirit,” the product of the translation is merely a “representation” of the experience and not the experience itself. Lived theology is not reflection on “that which is over there,” but a living out of significance rather than a living in relation to a representation of that experience.

Lived theology further presumes that if we are inherently theological, then our very nature as human beings is formed and led by what is of ultimate concern in our lives. Viktor Frankl’s (1905–1997) logotherapy is likened to this perspective in the conviction that meaning lures and constructs human development (1946/1997). We live and intend toward meaningful and fulfilling projects and relationships in life. Our enactments of significance, and, hence, any lived theology, are naturally transcendent seeking but delimited by one’s unalterable finitude, facticity, contingency, and “thrownness,” to use phraseology from Martin Heidegger (Heidegger 1962). The very delimitation of one’s “thrownness” enframes the meaningful possibilities of significance enacted in each moment and is free to change as significance shifts.

Commentary

A word about therapeutic care for, and as, lived theology is in order. Therapeutic practice based on this model begins and ends with attunement toward enactments of significance in particular life-world comportments. It then explores constrictions, that is, how one’s enactments of significance are restrained, inhibited, or confined. Finally, it has as the therapeutic goal, a free and authentic living into one’s cleared and lightened possibilities within one’s embraced limitations. All symptoms of the suffering soul are constricted enactments of significance and related to the inextricable interplay of death, transcendence, and radical subjectivity and are always and already lived out in equiprimordial ways. An obvious alignment with Daseinsanalytic phenomenology

and practice is clear (Boss 1979; Heidegger 2001).

Often, discussants of this issue quibble about whether one considers oneself religious, spiritual, or theological. I choose to use the word “theology,” rather than “spirituality” or “religion,” because I believe the latter two concepts are less personal and too amorphous to disclose the specificity of one’s very particular enactments of significance in the world. Moreover, one’s comportment in existence discloses what one considers significant with much more veracity than what one verbalizes as significant. If you want to know someone’s theology, look at their enactments of significance *in the world*. At no time are we absent from living out enacted significance, even (and especially) in despair. Paraphrasing once again Tillich’s argument that doubt shows the significance of faith (Tillich 1957), I say that despair is an enacted significance of *lost significance*, which is perhaps the greatest of all therapeutic challenges.

Locus of Control

Andrew J. P. Francis

Division of Psychology, School of Health Sciences, RMIT University, Bundoora, VIC, Australia

The Locus of Control (LOC) of reinforcement construct was originally developed by Rotter (1954, 1966) within the framework of his Social Learning Theory, along a unidimensional internal-external continuum. An important elaboration by Levenson (1981) divided the external contingencies into separate “powerful others” and “chance” dimensions. Broadly, the LOC construct measures the degree to which people believe that

reinforcements (rewards and punishments) from the environment are contingent on their own efforts, actions, and personal decisions (internal LOC) on the one hand versus luck, fate, external circumstance, and powerful others (external LOC) on the other. A more internal LOC is generally positively associated with a range of indices of psychological and physical health. It is argued that many of these positive health effects reflect the adoption of more positive coping strategies in such individuals. Conversely, externality is typically associated with negative coping styles and poorer physical and mental health outcomes.

In some LOC scales (e.g., the religious revision of Rotter's internal-external scale), the external “powerful others” set of contingencies includes reference to a deity. Thus, the individual believes that, to some degree, the circumstances of their life are controlled by a god, goddess, or other spiritual forces. The belief that an external deity may be controlling some contingencies in a person's life suggests a type of external (powerful other) LOC and might be expected to be associated with generally poorer health outcomes according to secular LOC theory. Certainly Sigmund Freud and Albert Ellis characterized religious belief in terms of defensive functioning and psychopathology, whereas Carl Jung and Gordon Allport suggested that religion may have important psychological functions and produce positive effects on mental health.

Contemporary scientific literature would suggest that degree of religiosity is positively (albeit mildly) associated with better mental health outcomes, in particular where the type of religiosity is “intrinsic” versus “extrinsic” according to Allport's (1961) taxonomy. It has also been suggested that a person's dispositional “spiritual/religious coping style” will influence how they respond to stressors and challenges and, in a sense, specifies the nature of the control relationship they share with their god. In a self-directing style, a person functions in an active manner, independent of god (essentially a form of internal LOC). When a person adopts a deferring style, they will take a more passive role and wait for god

to resolve a situation (thus adopting an external LOC). In a collaborative style, the person engages with their god in a mutual problem-solving process (mixed internal-external LOC). A surrendering style involves an active decision to release personal control over circumstances beyond personal control to god (external LOC). Depending on the situation, a collaborative style is generally associated with more positive mental health outcomes, although it has been argued that even the surrendering style can provide relief, comfort, and security in highly stressful situations. No matter which spiritual/religious coping style is adopted, it is also certainly the case that the use of prayer, ritual, and observance can instill an element of control into one's relationship with god.

Locutions

Paul Larson

The Chicago School of Professional Psychology,
Chicago, IL, USA

Locutions are inner experiences of hearing a divine voice or receiving revelation. The broader category is theophany or epiphany, which means any revelation or manifestation to humans by God or the divine or their agents such as angels. Visions, or apparitions, are epiphanies which are primarily visual, while locutions are the auditory aspect of contact with or from an external transcendent source. The experience can range from very realistic dialog with an angel (including an apparition) to a subtle and sudden feeling of inspiration coming in linguistic form. It is not uncommon for these visitations to be accompanied by other sorts of miracles, such as healing. St. Teresa of Avila is one of the classic examples of a mystic whose experience included locutions. Bernadette Soubirous (1844–1879) was a young French woman who also received locutions attributed to Our Lady of Lourdes. The Virgin Mary in both Roman Catholic, Eastern Orthodox, and Anglican traditions is a frequent source of apparitions and locutions. The Roman Catholic Church has a fairly detailed procedure devised over many years for checking the bona fides of claims for visions or locutions. Less clear cut examples can be found in the frequent use by mystics of the metaphor of the small “inner voice” that guides their spiritual growth and becomes a central part of their experience of the Divine. An example would be George Fox (1624–1691), the founder of the Society of Friends, of Quakers, who reported hearing a voice that guided him in

resolving spiritual conflicts. These inner voices often are heard during a period of quiet meditation or contemplation so as to still the external senses allow one to open up to the Divine.

Logos

Meredith Lisagor
New York, NY, USA

Earliest Use of Term

Logos, a noun, derives from the Greek verb *legein*, originally *to count*, later *to give an account*, finally as *lego*, *to say*. It enjoys an array of nuanced translations: *utterance, word, speech, thought, meaning, reason, argument, ratio, measure, standard, or principle*. Yet whatever distinctions exist among thinkers who employ the term, Logos is consistently used to denote something about creative unifying forces or functions in the composition of reality – cosmologic, religious, philosophical, or psychological.

As a concept, Logos is first encountered in the fragments of Heraclitus of Ephesus (ca. 500 BCE), where it identifies the underlying ordering principle or plan of the universe, which is itself a hidden unity of opposites in tension. The

Logos is not the source of creation, but rather the way in which creation operates, the flux in which “diversity comes out of unity and unity out of diversity” [Frag 10]. Although all creation is elemental of the “One,” humanity must “listen” for the Logos in order to comprehend it.

Platonic and Aristotelian use of the term was largely confined to the fact and consequences of human reason. Stoicism, however, took the term beyond the limits of philosophy. Heraclitus’ Logos became equated with a dynamic divine reason. Here, humanity did not merely participate in Logos, but was infused with it: Discourse, meaning-making, and life in accord with natural law – or the order given the cosmos by an all-virtuous God/Logos – were products of a “seed” or “ratio” of divinity within each human being.

As Divine in Judeo-Christian Tradition

The divine character of Logos underwent subtle but profound change, when Jewish and Greek thought converged in the works of Philo of Alexandria (30 BCE–50 CE), who enlisted the term to place Torah on equal footing with Greek philosophy. Adapting Jewish Wisdom speculation – and often using “word” and “wisdom” interchangeably – Logos became both the intelligible world in the mind of God, after which the created world was modeled, and the agency by which it was actually made. By Hellenizing notions found in Jewish texts, canonical (e.g., Proverbs 8:22) and apocryphal (e.g., Wis. 7:22 and 9:1), Philo made the Logos a virtual hypostasis of God, His “First-born Son,” and “Image.”

Philo’s syncretism had arisen in an environment that also sustained popular belief in Apollo (especially surnamed Loxias, *fr.* *legein*) as the “spokesman” of his father Zeus. Thus, it was a short step to dubbing Jesus the Logos and Son of God – which the prologue to the Gospel. According to St. John (1:1–18) did near the beginning of the second century. Where St. Paul had declared Jesus Christ the one “through whom are

all things and through whom we exist” (I Corinthians 8:6), the Johannine authors (adapting a Wisdom hymn) trumpeted that the creative Word of God became flesh and entered the world it had created; no less, it “was God.”

Early Christian writers would employ Logos broadly and idiosyncratically: Justin Martyr followed a Philonic impulse in his *Apologies* (ca. 55 CE) to liken Christianity to stoic and platonic philosophies; Clement of Alexandria (ca. 150–215) even identified the eternal Christ/Logos as the giver of philosophy to the Greeks; and Christian Gnostics had at least three different notions of Logos – all disdaining the occurrence of actual incarnation. Significantly, Origen (ca. 182–254) saw Logos as a kind of effluence of God’s creativity, truth, and wisdom. It could be called God’s “Firstborn Son,” but in fact it was not only uncreated but coeternal (“there was no *when* it was not”). Moreover, Jesus was not really an incarnation of the Son, but rather a sinless human being who followed the Logos so closely as to be indistinguishable from it. This set the stage for the great Trinitarian and creedal debates of the next two centuries. In the end, Logos language was replaced by the term “Son.”

Logos and Other Traditions

Development of the Logos concept continued into late antiquity: Hermetics declared that the “lightgiving word who comes from [God’s] mind is the son of God” (Copenhaver 1992, p. 2); Plotinus (205–270 CE) deemed Logos to be a divine entity of creation, unity, and order, but denied it rationality, since reasoning-out should be unnecessary to the mind of God in which all is immediate intelligibility; and the Jewish Wisdom tradition grew to identify the whole of Torah with the plan by which God created the world (Midrash Rabbah).

While one cannot argue a hereditary relationship between Logos and eastern religious thought, Logos is sometimes likened to the ultimate principle of Self in Buddhism, and the Way of Taoism. As the second person of the Christian Trinity, Logos has also been compared to the second

facet of the Hindu formula *sac-cid-ananda* or Being-Awareness-Bliss.

Logos and Depth Psychology

Modern depth psychologists have adapted Logos in a range of ways. Freud makes the most limited use, ironically calling Logos the “god” of his argument for rational acceptance of reality against the illusion(s) of religion. Analytical Psychology often equates Logos with the Self, archetype of psychic wholeness and unity of all opposites. The most noteworthy application of the term may be that of Viktor Frankl. Based on his own experience and observation of fellow concentration-camp survivors, his Logotherapy speaks to a meaning-seeking will at the center of human existence. In even the worst objective circumstances, he contends one has freedom as well a “responsibility” to seek transformative subjective meaning. It is exercise of this will that defines an authentic life.

Loki

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

Loki is the trickster in ancient Norse mythology – Scandinavia's Viking traditions. His legends were preserved by the ninth- and tenth-century *skalds* (bards) (Fig. 1). The early main surviving texts are the Icelandic *Eddas*. Loki is a crafty, seductive, paradoxical, and malicious/heroic trickster among the gods. He can assume different shapes (e.g., fire, horse, or falcon). His literature is a compilation of many free-wheeling themes. We find no tidy well-crafted novel with a clear plot here. Psychologically, Loki's myths express the multifaceted contents of the Norse collective unconscious. Any culture's collective unconscious can easily behave like a rowdy trickster, appearing inwardly or outwardly, shifting shapes, in diverse, baffling, dreamy images, rituals, and narratives.

Loki, Fig. 1 From Icelandic manuscript SAM 66. 18th century Norse. Iceland: Arni Magnusson Institute. Public Domain. (Source: http://en.wikipedia.org/wiki/File:Processed_SAM_loki.jpg)

For the Norse, Loki can be a trickster of the big, tough hard-drinking macho warriors, or a distracting, seductive mare who gives birth to an eight-legged horse. He was an archetypal handsome rascal, attentive to the goddesses, who rarely resisted him. He sometimes worked to help the gods but often worked to undermine them and eventually to bring about their downfall in the “Twilight of the Gods.” His tradition may have absorbed some elements of the Christian Devil. But whereas Christian faith affirms the dominance of God over the Devil, the Nordic shadowy powers were apparently archetypally stronger than the Christian Devil, so the myths express a cloud of doom about their demise (unless the “Twilight” is a late addition).

Loki was early on imagined as a fire demon. In Norway, when the fire was sparking, people would say that Loki was thrashing his children, suggesting a threat of punishment to children (Tonnelat 1959, p. 266).

Once Loki was trapped by the giant Geirrod who made him promise to deliver the mighty Thor to him without his magical hammer, iron gloves, and belt that made him invincible. Loki deceptively managed to get Thor to agree. But on the way to Geirrod’s castle, they met Thor’s devoted lover the goddess Grid. She was suspicious and loaned him her instruments of invincibility – gloves, girdle, and magic wand. With these he managed to escape Geirrod’s vicious traps and avoid Loki’s deception.

The Nordic apples of everlasting youth essential to the gods were guarded by the goddess Idun. Once, when Loki got into a scrape, he had to promise to his captor the giant Thjazi, in eagle form, that he would deliver to him the goddess Idun and her magic apples. So he lured Idun into the forest under false pretenses, and she was captured by the nasty Thjazi and dragged away. So the gods of Aesir began to grow old, deprived of their magical apples, and they were furious with Loki. They forced him to go and retrieve Idun. So he took the form of a hawk, flew to the kingdom of the giants, and turned dear Idun into a nut and flew back with her in his beak. The angry giant turned himself into an eagle and chased Loki, but thanks

to a huge fire built by the gods, his wings were burned and he fell to his death.

Here, the shadow trickster turns from harming the gods to helping them; this echoes Jung’s insight that there is a treasure to be found in the shadow and that the inner divine Self regulates conflicts between archetypal instincts.

Loki was at his tricks again when he cut short the tresses of Thor’s wife Sif. Angry Thor grabbed Loki and began breaking bones, until Loki begged for mercy. He promised to have the dwarves make Sif’s hair of pure gold that would grow like regular hair. Loki hustled over to the forges of the dwarves, sons of Ivaldir. Easy, they said, and offered to make not only Sif’s golden tresses but also two gifts for Odin: a magical ship, *Skidbladnir*, that would sail on its own accord and a spear, *Gungnir*, that would never stop until it hit its target. The rascal Loki is forced by the Self figure Thor to call on the craftsmen for help. The dwarves, diminutive but skilled, provided treasured golden hair to fulfill the dreams of every dreamy high-maintenance goddess, effortless energy for every hard-working sailor to move psyche’s dramas along, and a satisfying phallic spear for the king of the gods. Loki bet two competitive dwarves that they could not outdo their brothers, but they came up with the magical golden ring *Draupnir*, which would make its owner constantly richer, and Thor’s thundering hammer (Tonnelat 1959, p. 267). The golden ring continued its captivating power in English folklore and literature, since what greedy ego can resist the illusion of endless wealth? The thundering hammer will never lose its lightning ability to ram home the nails.

In Asgard, the land of the gods, Thor, the god of thunder and hammer, was once tricked by Loki when he was challenged to drink a huge horn of beer that turned out to be magically never emptied. Then he was called on to wrestle with an old woman, but for all his strength, he could not move her – rather she forced him to his knees. It turned out that the horn had its tip in the sea, and the old woman was Old Age, who defeats all. The bragging drinkers and the powerful fighters can be overcome by a trickster, who reveals clever skill

and fate's archetypal inevitabilities (Davidson 1969, pp. 66–67).

The construction of a defensive wall around their Midgard was contracted out to a giant Jotunn, who had a giant stallion who could pull a huge load of rocks. But as pay the gods had to promise him the sun, the moon, and the love goddess Freya. But it had to be done by a strict deadline. The gods thought that he could never complete it on time, so they would not have to pay so dearly. But he showed them and moved ahead of schedule. So Loki went into action and turned himself into a mare who flicked her cute tail at the stallion, who then chased her into the woods for a 3-day tryst. This prevented the wall's completion on time. Then Loki as the mare gave birth to an eight-legged stallion, Sleipnir. Here, the beastly giant helps the psyche build its inevitable defenses, seemingly at no cost. So Loki's gender-shifting, shape-shifting transformation generates a frisky tryst that creates a magically high-energy beast, the envy of every hard-riding heroic ego. For a male to transform into a female and give birth would shame his manhood in Nordic society (Von Schnurbein 2000), but Loki is a trickster, and they do that, perhaps to mock the norm.

In a comic twist, the god of thunder Thor's hammer had been stolen and had to be retrieved to protect the gods. Loki found out that the thief Thrym demanded that the gods send him their goddess of love Freya to be his bride. But a clever ruse was hatched. Thor dressed as Freya, leader of the Valkyries, and Loki as his handmaiden. Again, for a man to dress as a woman would threaten his masculinity in Nordic society, so this must have caused considerable laughter (Von Schnurbein 2000, p. 120). Though suspicious of the bride's huge appetite, the giants proceeded with the ceremony and placed Thor's hammer on the "bride's" lap. When Thor got his hands on the hammer, he killed the giants. Gender-bending disguises are a favorite of many trickster dramatists, such as Dionysus and Aristophanes, and the hammer in the lap of the goddess of love is a surefire way to tickle the audience, as psyche's trickster knows.

Loki's amorous adventures were many. God of fire, he seduced the goddess Glut (Glowing), who

bore two daughters: Einmyria (Embers) and Eisa (Ashes). Next he charmed Angrboda, a giantess who gave birth to Fenrir the Giant Wolf, Jormungand the evil Earth-encircling Serpent with his tail in his mouth (a life-death *uroboros*), and Hel the Underworld Goddess. Many archetypal tricksters, in world mythology, like Kokopelli in Southwestern Native American tradition, also seduce the girls and cause trouble. Imagine that!

Loki's most deadly feat involved Balder, whose mother had tried to make him invulnerable by extracting pledges from all the plants, trees, and metals to not harm him. The gods at banquets would hurl weapons at Balder for sport, yet they could not harm him. But Loki discovered a plant that she missed: mistletoe. So Loki made a dart with mistletoe and gave it to Balder's brother Hoder, who threw the little spear at him and Balder fell down dead, to everyone's astonishment. The gods grieved and held a great funeral on his ship with his wife and horse set afire, sending them to the land of the dead, ruled by ruthless Hel. So be not proudly inflated, ye gods, for even the greatest strong warrior or god can fall to a tiny trickery, says Loki. Tricks have always been among fighters' weapons. This scene suggests to some scholars that Balder is a Christ image, and Loki then becomes the Christian Devil, in the theory that Christianity influenced Nordic myth (Von Schnurbein 2000, p. 124).

As the Nordic myths lumber toward their tragic end, a banquet scene displays Loki's way of ripping off masks of dignity by exposing everyone's shadow behavior. A dwarf Brokk had angrily sewn up Loki's lips to stop his nasty talk, but Loki soon tore out the thread. The shadow is repressed, but not for long. His love of intrigue and betrayal led to his insulting all the gods of Asgard. So he was not invited to Ægir's big feast where only Thor was absent. But he slipped his sneaky way into the crowd by pretending humility and friendship. But Bragi, whose duty it was to welcome guests, refused to welcome Loki, so when Loki raised a cup to the health of each god and goddess, he avoided mention of Bragi, who began to apologize. But Loki turned on him and accused him of cowardice in verbal combat. Loki

turned up the heat and reminded every god of his scandalous mistakes. He accused every goddess present of unfaithfulness to their husbands. He savagely boasted of his affairs with most of them. Odin struggled to stop the mounting mockery. Idun, wife of Thor, offered him a cup of mead and urged him to calm down. But Loki would not stop. He lashed out at her, bragging that he had held her in his arms and that she loved it. At that climactic moment, Thor thundered in the hall to raise his deadly hammer over Loki's foolish head. Loki pretended to submit and headed toward the exit. But he let loose with a final threat of doom. Not only would there never be another banquet like this, but this hall would soon be destroyed by fire. Loki's final insult was to announce that the end of the world was about to come. They would all perish in an apocalyptic fire that would be the Twilight of the Gods. Loki the shadow betrayer, cynical trickster, overwhelms the psyche's personas of honor and dignity with his ruthless attacks and unrestrained malice. Sounds like a trickster-loaded political or military battle.

Loki is sometimes pictured tied to a rock with a venomous serpent dripping poison onto him, much like the Greek Prometheus, who stole fire from the gods to give humans, boosting their ego-consciousness (Loki).

The great disaster of these gods, like fire shooting up from a volcano in snowy Iceland, was Ragnarök. This horror involved a tidal wave, a ship steered by Loki, and the rising of the great evil serpent from below. Thor attacked the vicious *uroboros* serpent/dragon Jormungand and killed him, but his poisonous venom also killed Thor. Flames rose as the earth sank beneath the waves (Davidson 1969, p. 122). The apocalypse theme is common in world mythology and religions, symbolizing the end of an era. Nordic myths, long-steeped in and brazen destruction, suffered from this perilous cloud of doomed fate.

Love

David C. Balderston
New York, NY, USA

Love is a powerful force that connects and energizes people. It has long been a theme of religions and literatures around the world. More recently, love has been studied by social scientists. This article surveys the major meanings of love, as used in various religions and in modern psychological thought.

Introduction

Love means several different things. Other languages have two, three, or more words with different meanings, where English has only one, to use in many different situations. The authoritative

Oxford English Dictionary describes over 30 uses of “love.” Like many writers, Scots poet Robert Burns (1759–1796) used literary devices to heighten the effects of his thoughts, e.g., “O, my luv’s like a red, red rose” – here, a simile to dramatize love’s power of attraction. In contrast, a modern definition strives for neutral objectivity: “Love is the creating and/or sustaining of the connections of mutual support in ever-widening ranges of significance” (Carothers 1968). Shakespeare noted love’s irrational mystery: “I know not why I love this youth, and I have heard you say, Love’s reason’s without reason” (Shakespeare, *Cymbeline*, ca. 1609/1974, IV.2.20–22).

Here are some of love’s emphases:

1. A *desire for physical closeness* that connects people, to touch and be touched, whether they be sexual partners, parent and child, other family relations, or close friends.
2. *Compassion* of one person toward another, sometimes one who is in need. Altruistic self-sacrifice and empathic understanding of how another feels are components of such love, often recommended by religions.
3. A *mutual affinity* in a friendship that is not primarily sexual but emotional and value-laden, with shared interests and sensibilities and actions of mutual generosity.
4. A *religious regard* for another, where a human and a spiritual being (a god or a saint) are linked in a relationship of gratitude and devotion by the human and scrutiny and/or caring by the spiritual figure.

Religion

The world’s five largest religions, arranged here from the oldest to the newest, are surveyed for their uses of love. Judaism, which provided the scriptural foundation of monotheism for Christianity and Islam, is also included.

Hinduism, the dominant religion of India and of Indians living elsewhere, is a sprawling, decentralized complex of many parts. Hence, the place of love in Hinduism is more diffuse compared to other religions. The following Sanskrit

terms suggest the range of loving experiences. *Kama* is sensual pleasure and erotic love. It is also seen as a fundamental life force, a necessary ingredient in other human desires and strivings. *Karuna* refers to compassionate actions to reduce the sufferings of others. *Bhakti* is devotional love, adoration, and service directed at one’s chosen deity. *Prema* is an intense and altruistic longing for God and is considered Hinduism’s highest form of love.

Judaism, the religion of Jewish people worldwide, stresses ethical behavior and devotion to a single God, who formed a covenant relationship with “his people” in which he would protect, chasten, and love them while expecting their grateful adoration and obedience to his laws. This is elaborated in the Hebrew *Bible*, where love is translated from the words *ahab* and *khesed* (and their cognates) as desire, mercy, beloved, steadfast love, loyalty, kindness, devotion, and faithfulness.

The great ritual phrase, the *shema* (Deut. 6:4–5), calls upon the people of Israel to love God with all their heart, soul, and might. Elsewhere, God directs them to love their neighbors and also the stranger in their midst (Lev. 19:18 and 34). The prophet Hosea used the imagery of an unfaithful wife, lovingly sought out and forgiven by her husband, to stand for God’s undying love toward his sometimes unfaithful people.

In *Buddhism*, love has a central place: its founder, Siddhartha Gautama (563–483 BCE), is typically referred to as the “compassionate Buddha.” The earlier branch of Buddhism, called Hinayana or Theravada, focuses on love as *metta* (in Pali, or *maitri* in Sanskrit), a kindness or benevolence toward all. The later branch, Mahayana, emphasizes *karuna*, compassion, and its ultimate embodiment in a bodhisattva, one who has attained full enlightenment. The bodhisattva most identified with loving compassion is Avalokiteśvara (Sanskrit), or Chenrezi in Tibet, often depicted with a multitude of arms and hands, to reach out and help multitudes.

Since Buddhism, a nontheistic religion, teaches that all reality is illusory, one’s sense of self-importance is to be devalued, and one is to act as a vehicle of compassion toward others. The

various schools of Buddhist meditation, based on deep psychological and philosophical analysis, may focus on neutralizing the mind of its self-centeredness or filling the mind with compassion toward others.

Confucianism has long been the dominant religion of China and of millions of ethnic Chinese overseas. Confucius (551–479 BCE) taught a version of right living, preserved in the *Analects*, which emphasized the good of society more than the individual. Confucian ethics codified the “five relationships,” which stressed “filial piety” (love as respect) between pairs of family members and others. Confucius taught that the “way of Heaven” (*T’ien*), or a moral life, should be lived by *jen* (translated as benevolence, uprightness, or love) and *li* (proper etiquette and rituals – to preserve social harmony). The Confucian emphasis, on reciprocity (mutual expectations of appropriate role behavior in social relations), was opposed by the radical views of Mo Ti, who followed Confucius about a century later. Mo Ti (or Tzu) promoted *ai*, a universal love that ignored all distinctions of rank or family position, which he said caused trouble. Mo Ti had many followers, but his ideas died out after the counter efforts of Mencius, a follower of Confucius. This conflict is an example of how different values, reciprocity and universality, can pull love in opposite directions.

Christianity, the world’s largest religion, relies on the New Testament of the *Bible*, which used two Greek words for “love,” *agape* (self-sacrificing love) and *filia* (friendship love), while ignoring a third word, *eros* (erotic love), also in common usage then.

Jesus, the central figure of the New Testament and the Christ of Christianity, was a Jew living in a Jewish society in the land of Palestine, then governed politically by Roman rulers and religiously by Jewish high priests. Love was a major theme of Jesus’ message. In the “great commandment” (Matt. 22:35–40, Mark 12:28–34, and Luke 10:25–28), Jesus rebutted Jewish leaders trying to entrap him doctrinally, saying that people should love God with all their heart, soul, and mind (or strength) *and* their neighbors as themselves – just as the scriptures had said

earlier but in two separate passages (see Judaism, above). When asked a follow-up question, “Who is my neighbor?” Jesus told the story of a compassionate Samaritan who helped an injured Jew, even though Samaritans were despised by Jews.

Jesus also preached the radical notion of loving one’s enemies (Matt. 5:43–48 and Luke 6:27–28, 32–36). Twentieth-century examples are the effective nonviolent protest campaigns of Mahatma Gandhi and Martin Luther King, Jr.

During Jesus’ ministry, his ethical message became layered with the additional identification of himself as the Son of God, as he anticipated his death, as a chronic disturber of the Jewish and Roman status quo, to be the necessary means of conveying God’s ultimate message of self-sacrificing love: “For God so loved the world that he gave his only Son. . .” (John 3:16).

After the death of Jesus (ca. 30–33 CE) and his followers’ experience of his resurrection, the apostle Paul emerged as the leading missionary to the Gentiles (non-Jews). His letters to the non-Palestinian churches often develop the dual themes of God’s salvational love through the sacrifice of his Son, Jesus (now the Christ), plus the need for Christians to love one another. Paul made explicit the universal quality of this love of Christ that recognized no distinctions of gender, ethnicity, or social status (Gal. 3:28 and Rom. 10:12). Paul glorified the ultimate virtue of love in 1 Corinthians, chapter 13. A later apostle also wrote to exalt love, declaring that “God is love” (1 John 4:7–21).

St. Francis of Assisi (ca. 1182–1226 CE) expanded the scope of love to include animals and all of creation.

A tension has always existed between the commandment to love your neighbor *as yourself* and the *selfless* love exemplified by Jesus. A balance is needed between loving oneself too much and not enough: both extremes prevent one from loving God and others, although finding that balance can be difficult.

Modern Christian theology and devotional literature continue to confront this tension regarding “self” and the human tendency for self-serving self-deceptions. Psychology has also studied this tendency. Theologian Reinhold Niebuhr wrote,

“Goodness, armed with power, is corrupted; and pure love without power is destroyed” (Niebuhr 1937), a theme developed later by Paul Tillich (1954).

In *Islam*, God (Allah) is always referred to in the Koran (*Qur'an*) at the beginning of every chapter (sura) as “the merciful, the compassionate” or as “most gracious, most merciful.” These phrases come from one of four frequently used Arabic word groups that convey various Koranic nuances of love, from the roots of *hbb*, *rdy*, *rhm*, and *wdd*.

Of the Five Pillars of Islam, the injunction to give alms to the poor is the one most directly connected to loving activity, but the Koran is suffused with themes of benevolence, kindness, and mercy – variants of love.

One movement within Islam is Sufism, which promotes an intimate personal connection between the believer and Allah through a mystical development of love.

Overall, the message about love from various religions might be summarized in interfaith terms something like these, with “God” representing the various names and conceptions of the Ultimate Reality or Ground of Being:

Love is what God is – the energy that binds Creation and all its creatures.

Love is what God offers *to* humans – a way to be Alive despite imperfections, anxieties, and suffering.

Love is what God expects *from* humans – respect for the Creator and all Creation, with awe at its vastness and complexity.

Love is what God desires *between* humans – to give unselfishly.

Across the spectrum of world religions, the importance of love – coming from God and human love toward God, self, and others – has been reinforced by many believers through specific methods: reading devotional literature and selected passages of scripture, reciting certain prayers and chants, and repeating certain ritual practices that emphasize love. Psychologically, a critical distinction exists between the effort to produce a desired *feeling* of love, by inculcating

the ideal that one *should* feel loving, and the more achievable goal of practicing certain positive, loving-type *behaviors*, which in turn may make it more possible over time to experience loving feelings, along with some acceptance and closeness, toward persons and groups that formerly were avoided, disdained, and considered unlovable. Thus, a prejudice against others (“Do *NOT* love them”) can be neutralized through specific actions, which can enhance the development of loving feelings. This sequence, from deliberate actions leading to predictable (and desirable) feelings, while oversimplified here, is also a basic principle of psychology.

Psychology

Psychology has studied love from five different perspectives: (1) as an individual emotion, especially in romantic love; (2) as individual behavior; (3) as a relationship between two (or more) people; (4) developmentally over time; and (5) socially as influenced by various social and cultural group norms. Psychotherapists also deal with the absence and failures of love in crumbling marriages, child neglect and abuse, adolescent problems, addictions, depression, and other anxious and lonely states.

1. Love as *a feeling of an individual* is a wonderful, tumultuous experience. In romantic love, a person who has “fallen” in love experiences a heightened sense of well-being: one feels special in the eyes of the beloved, understood as never before, with an improved sense of one’s sexual identity as a man or woman. One may be preoccupied by frequent thoughts of the beloved or inspired to act in unusual ways on behalf of the beloved. Sexual desire – or at least the desire to touch, be physically close, and kiss – is a major part of romantic love, along with an idealization of the beloved. This is in contrast to a depersonalized lust for a sexual “object.”

The emotion of love contains strong elements of wish, hope, longing, and fantasy. What is often sought is a sense of being made

whole, through closeness with another. This goal is also a theme of religious devotion: that divine love will make a flawed human whole, worthy of being loved by another being (human or spiritual) and capable of giving love to others.

Romantic love began in the twelfth century CE songs of European troubadours celebrating the courtly love of knights of chivalry, who labored dramatically to impress and woo their chosen, often married noblewomen. While this love never applied to the rest of the population, it did idealize the quest for a pure love (later portrayed by Dante and Petrarch), and it promoted tenderness and a better view of women (Hunt 1959).

2. Loving *behaviors by an individual* are many: touching and hugging, complimenting, offering help, paying attention to what the beloved is saying and feeling, sacrificing one's time and money for the sake of the beloved, being on time and especially presentable, being patient with the other's imperfections, and being willing to apologize for one's own – to name a few. A lover's complaints typically are about the partner's behavior.

Psychology usually sees outward behavior as an indicator of a person's inner motivation: we often convert our feelings into action. One is held responsible for how one behaves, but not for what one is feeling. Behavior, since it is normally under one's control, can also be used to change one's feelings – the opposite of emotions shaping behavior, as in psychodynamic theory (see an integration of psychodynamic and behavioral approaches at Weinberg 1981). Thus, a person can learn consciously to behave, and eventually feel more lovingly.

3. Love is *a relationship between two people* (or between a human and a divine being), and how the two respond to each other can be studied to see their patterns of interaction. Is there mutual respect between the two or domination by one? Is one person's criticism usually followed by the other's withdrawal or defensive outburst? Repeated arguments about money, in-laws, friends, or work often

conceal an underlying concern: "Do you really love *me*?" In parent-child relations, does the parent feel (and act) mostly with tenderness, or frustration, or detachment? What kind of attachment behavior does the child show toward a parent: secure, avoidant, anxious/ambivalent, or disorganized (Cassidy and Shaver 1999)?

Love is also the commitment to a close relationship, i.e., dedicated to preserving and enhancing the relationship, for the sake of the well-being of both people, for as long as possible. This commitment is also for the sake of the relationship itself, sometimes despite the negative feelings of one or both of the parties involved – perhaps for the sake of other dependents. The commitment to loving another as much as oneself (see above, Love in Christianity) can be sorely tested when a chronic ailment of one person makes the relationship one-sided and the healthy one becomes a caregiver. Typically, long-term caregivers eventually develop "compassion fatigue" (the love wears thin) and become less caring and less healthy themselves. A rebalancing effort is then needed, whereby the caregiver deliberately shifts some attention and caring to himself/herself at least temporarily. Caring (loving) needs to be distributed to both self and the other, so that neither one gets all the attention and neither one suffers total neglect. Love in a committed relationship ideally is a dynamic arrangement with each person giving and receiving love in fluctuating amounts.

4. Love can be understood as *a process of development over time*. Erikson's eight stages of human development (Erikson 1963) express this idea: adolescence is the stage for developing an identity (finding oneself), during a period of experimentation after the childhood self has been discarded. But if identity is not adequately developed before entering the next stage, sharing intimacy with a partner in young adulthood, then the lover will not have enough of a developed self to share, and the relationship will suffer. On the other hand, while "puppy love" of earlier childhood may be

mocked, developmentally it is age appropriate; it is the extent of love that youngsters are capable of, as they imitate adult behaviors and attitudes.

5. All of the above aspects of love take place within *systems of social expectations*. National, racial, religious, social class, and other cultural norms are always present, exerting limits on the permissible range and appropriate forms of expression of love. The family everywhere is a major human institution, upholding these wider norms and also containing its own private rules, rewards, and understandings of love. When a modernized culture emphasizes individualism, romantic love can happen freely, but where collective stability of the larger family or social system is emphasized, as in traditional cultures, such love is seen as a threat and arranged marriages are more typical.

Culture may also affect parent–child love when it favors one gender over the other. Birth order customs may require that the oldest and youngest child receive different kinds or amounts of love than other siblings (Toman 1976). A child’s inborn characteristics of temperament (Chess and Thomas 1984), intelligence, or sexual orientation may affect the ability of parents to love a child who is “different.” These psychosocial and situational factors contribute to making love a highly complex phenomenon.

Among psychological *theories* about love are these: *Freud* developed theories about basic drives (especially sex), unconscious wishes and fears, and delayed adult reactions to childhood emotional experiences, all with implications for human love. Freud turned the Golden Rule on its head: you will do to others (in the present) as you have been done unto (in your past). *Maslow* posited an ascending hierarchy of human needs, with love midway (Maslow 1987). *Harlow* showed, by depriving young monkeys of their mothers, that the normal development of an infant requires what might be called primate love – a stable caregiver that can offer regular, warm physical contact; otherwise, adult mating and parenting abilities

will be devastated (Blum 2002). *Sternberg* sees three dimensions to adult love: intimacy (sharing oneself), commitment (to the relationship), and passion (physical and emotional) (Sternberg and Weis 2006). In addition, *Rogers* believed that effective psychotherapy requires that a therapist demonstrate “unconditional positive regard,” a professional kind of loving (Rogers 1961).

The opposite of love may be hatred (another kind of powerful interpersonal connection), but sometimes it is the absence of love. A loveless childhood may lead to a loveless adulthood, where a person is unable to care about the feelings of anyone else – in the extreme, an unloving, antisocial personality, previously known as psychopathic or sociopathic. By comparison, the narcissistic personality has mostly given up on ever finding, yet secretly longs for, the love of another person.

Love can be austere: a self-help group uses the concept of “tough love” to help parents cope with the emotional manipulations of wayward offspring. In such situations, religion can remind one of the images of steadfast love, while psychology can recommend empathy, to feel in oneself the other’s distress and alienation, plus the objective compassion of therapy.

The philosophy of existentialism has contributed Buber’s “I-Thou” relationship as a model for responsible loving (Buber 1923/2000) and Sartre’s comment that there was no such thing as love, only loving acts.

In summary, love, while subject to various interpretations by different psychologies (and also religions), is a prominent, complex, and sometimes problematical feature of close personal relationships. Growth in love relationships usually requires persistence in communications of all sorts to nurture the relationship, honesty about one’s shortcomings, willingness to make sacrifices for the sake of the relationship, and acceptance of a measure of uncertainty in our still-limited understanding of how, why, and when love fails or succeeds.

In conclusion, while scientific research will continue to study love’s intricacies, and psychological understandings will continue to enhance

our ways of improving interpersonal relationships, religion (and popular culture) will continue to put forward the belief that love is both necessary and mysterious – a positive force in human relations that we all can be thankful for.

Lust

Georgios A. Orfanidis

Department of Theology, Faculty of Theology,
Aristotle University of Thessaloniki,
Thessaloniki, Greece

Lust or lechery is generally defined as the intense psychological impulse that instinctively leads the human will to acquire a desired person, object (e.g., money), office (e.g., positions of authority), or anything else. Alternatively, the sense of lust is treated as a case of the heightened sexual instinct/an energy with which mental processes and structures are invested and which generates erotic attachments (*libido* inside the view of Sigmund Freud) (Rycroft 1995), or sometimes as a degraded emotional type of pure sexual energy (Fisher et al. 2006). However, it is usually thought of as intense or unbridled sexual desire, which is inextricably linked to the impetuous thinking and oppressed fantasy (Long 2006), often leading to an unexpected and widely unacceptable by most socio-religion contexts situation (e.g., fornication, adultery, rape, bestiality) (Lazarus and Lazarus 1994). The feeling of lust may occur at any time in the everyday life of a heterosexual or homosexual social subject (person), regardless of the social, economic, political, and cultural background of the same and/or its environment in which it is developed.

According to the *Old Catholic Encyclopedia* or *Original Catholic Encyclopedia* (full name: *The Catholic Encyclopedia: An International Work of Reference on the Constitution, Doctrine, Discipline, and History of the Catholic Church*) (1907–1912), a Christian's heart is in reality lustful when “venereal satisfaction is sought for either outside wedlock or, at any rate, in a manner which is contrary to the laws that govern marital intercourse.” Widely, the Christian tradition, and especially the philosophical teaching of the Catholic Church, supports that lust is a serious moral annex and considered to be a disordered desire for highest sexual pleasure, where this kind of pleasure characterized as “sought for itself”, isolated

from its procreative and unitive purposes. However, the Church does not stigmatize the pure sense of sexual desire, and consequently, is not excluded from God's plan (*Divine Providence*) for saving the humanity. Nevertheless, when sexual desire is separated from God's love, it becomes disordered and self-seeking, turning into lust (Jordan 1997). Lust is on the list of the *Seven Deadly Sins* (*pride/superbia, envy/invidia, gluttony/gula, lust/luxuria, wrath/ira, greed/avaritia, sloth/acedia*). Sins, introduced for first time by Pope Gregory I during the period 590–604 AD, are called “deadly,” because it is believed that they can deprive the divine grace, leading finally to the eternal condemnation of the soul of man; unless they are forgiven by confession. Every Sin is represented by a demon figure. The demon of lust, Asmodeus, a semi-biblical figure in Christian (Demon), Jewish (Shedim), and Islamic (Jinn) tradition/mysticism, is known mainly thanks to the *Bible* (2 Kings 17:30), the *Book of Tobit* (Tobit 3:8; 3:17; 6:13 and 8:3), some *Talmudic Legends* (*The Story of King Solomon and Ashmedai*) and the pseudepigraphical text of King Solomon (1st–3rd century) titled *Testament of Solomon*, (Testament of Solomon 5.21–25). As a demon of lust, he is alleged to be responsible for overthrowing the sexual desires of human kind.

Similarly, the tradition of the Orthodox Church, although it states that as lust may be generally received any fiery desire for excessive acquisition into a legal and religious society (1 John: 16–17), also points out that lust is closely linked to the irresistible desire to conquer a sexual subject, reading gingerly the Bible (Matthew 13:17; Luke 15:14–16 and 22:15–16; Acts 20:33).

In the culture of Judaism, all the vicious tendencies of humanity, including lust, especially with its fleshly version, are characterized by the demonic concept of *Yetzer Hara* (means “the imagination of the heart of man [is] evil”, Genesis 6:5 and 8:21), which leads man to the misuse of the material and spiritual goods of society needs himself to survive-evolve within social reality. Alongside, the same concept is identified with the figure of the highest diabolical existence, Satan (Šāṭān), who knows the hidden – and as well as oppressed – aspirations of each one and

leads man to the wrong choice (sin), and finally in the loss of Divine Grace (Divine of Yahve) (e.g., the erotic story of King David and Bathsheba, 2 Samuel 12:1–6). The deep knowledge of the Torah shields effectively the believer by providing religious and legal lessons about a better and not far from the divine favor quality of life (Reeg 2013).

In the Islamic tradition, the lust is represented as serious sin, which leads generally to an astray life, far away from the morality reflecting on the messages of Allāh. It is basically equivalent to fleshly desire and uncontrollable sexual activity (e.g., pornography, masturbation, adultery, rape, promiscuity). It is easily expressed through the body language among the adults, scandalizing many times the thought of men (Qu'ran 3:14; Collection of Ḥadīth: Al-Bukhārī no.5096; Muslim no.2742 and nos.3740–41), even if there is a strict regulation about women's dress code (*'awrah*), imposing most of the feminine body parts are covered with a variety of garments (e.g., Qu'ran 24:30–31; 30:21 and 33:32). Accordingly, it is consolidated gradually a series of respective practices in order to avoid possibly unethical relationships between the sexual subjects (sexes). However, the sexual desire is not at all forbidden in Islam, so long as it remains within the boundaries of a committed relationship between two consenting adults. Lascivious behaviors are done under the influence of Devil (Shayṭān). For example, the Quran states, “Satan threatens you with want, and orders you to commit shameful acts, but Allah promises His pardon and Grace, for Allah is bounteous and all-knowing” (Qu'ran 2:268). If Muslims desire to reduce the lustful level in their private and public life, especially according to the teaching of Sufism, they must temper their *nafs* (means “lower self/soul/ego”), which consist this aspect of soul that thrives on a variety of appetites (e.g., lust, ira, sloth). Otherwise, the believers easily led astray by the power of Satan (Frager 1999). It is, also, believed that through the transient and systematic feeding (fasting, *siyām*) – including the libation (wine drinking) – Muslims acquire the ability to control corporal appetites and distorted mental processes that have as background the

acquisition of pleasure, leading to the sin of lust (e.g. Qu'ran 2:183-185).

Reference to the concept of lust-irrepressible desire for the acquisition of material and/or spiritual benefits is also observed in the teaching of Buddhism. It is mentioned as *taṇhā* in the *Four Noble Truths* (1. *Suffering is inherent in all life*, 2. *Suffering is caused by lust*, 3. *There is a natural way to eliminate all suffering from one's life*, 4. *The Noble Eightfold Path is that way*) of the present doctrine (Harvey 2013). Indeed, *taṇhā* is one of the main causes –but non the first one according, mainly, to the teaching of Sri Lankan Buddhist monk Walpola Sri Rahula – of pain-dissatisfaction (*dukkha*) and the cycle of repeated birth, becoming and death (*Samsāra*) (Williams et al. 2012; Walpola Sri Rahula 2014). The philosophy of Buddhism distinguishes three different types of lust: (a) *kama-taṇhā*, referred to the longing for sensual/sexual pleasures, (b) *bhava-taṇhā*, reflected in the longing for existence and conquering eternity, and (c) *vibhava-taṇhā*, characterized by the longing for the ultimate non-existence, even if the desire to conquer this situation can be achieved through suicide or some other extreme individual act (Harvey 2013; Walpola Rahula 2014). The *Third Noble Truth* teaches that the cessation of *taṇhā* is possible, after personalized and systematic effort. More specifically, the Buddhist text *Dharmacakrapravartana Sūtra* states clearly advising a monk as follows: “*Bhikkhus (monk), there is a noble truth about the cessation of suffering. It is the complete fading away and cessation of this craving: its abandonment and relinquishment; getting free from and being independent of it.*” (Pāli Canon: *Dharmacakrapravartana Sūtra*, *Samyutta Nikaya* 56.11; Thera 1999). Practically, the *Fourth Noble Truth* of Buddhism leads human being to the mode of controlling the sensation of lust, as it asserts that the cessation of longing is achieved through the gaining of the *insight meditation*, which shapes the right conditions to overcome the three perceptible marks of terrestrial existence (*dukkha*/suffering, *anicca*/impermanence, *anatta*/non-self) (Walpola Sri Rahula 2014).

Generally, in the *Bhagavad Gita*, one of the most important sacred texts of Hinduism,

Krishna, an *Avatar* of Vishnu, report clearly in the verse twenty-one (21) that lust, one of the most serious sins, is born after man's systematic and distorted contact with the ideals of the material world, as he fills the human being with vanity and turns it into a downy of passion and inmost forbidden thoughts (Bhagavad-Gita 3.36-43; Davis 2014). Furthermore, the spiritual organization based on Hindu philosophical tradition, *Brahma Kumaris World Spiritual University (BKWSU)*, supports that the longing, and indeed the lust for the inadmissible and impure sexual activity, leads the human species directly to the gates to the Kingdom of Underworld (*Naraka*), the abode of Yama, the god of Death. For this reason, the supporters of the movement avoided the systematic consumption of onions, garlic, eggs, or, broadly, non-vegetarian provisions, which is thought to eventually awaken/increases rapidly and uncontrollable the sexual masculine and feminine impulses levels (Whaling 2012).

In the tradition of Sikhism, it seems that the sin of erotic lust is considered as detrimental to the benevolent development of the human soul, and therefore, it is included to the *Five Cardinal Sins/ Five Thieves (Panj Dosh or Panj Vikar)* among the rage/krodh, greed/lobh, attachment/moh, and ahamkara conceit/ahankar (Izzo 2017).

Luther, Martin

Daniel Burston

Department of Psychology, Duquesne University, Pittsburgh, PA, USA

The Rise of a Reformer

Martin Luther (1483–1546) was born on March 10, 1483, in the small Saxon town of Eisleben. His father, Hans Luther, a peasant turned copper miner, was shrewd, hardworking, and prosperous. In 1501, Luther commenced studies in philosophy at the University of Erfurt, where Ockham's nominalistic philosophy (or the *via moderna*) contended with the prevailing Thomistic worldview. In 1505, at his father's urging, he embarked on the study of law. One day, shortly after, he was stranded in a field during an immense thunderstorm and was so shaken by the experience that he vowed to St. Anne that he would enter a monastery if she spared his life. The storm abated, and to his father's considerable disappointment, he kept his promise, entering an Augustinian monastery in Erfurt. He was ordained in 1507, and the following year, he followed his mentor, Dr. Johannes von Staupitz, to Wittenberg to found an Augustinian university, which was outspokenly critical of medieval scholasticism and Aristotelian philosophy. For the following 10 years, Luther studied, lectured, and prayed dutifully. But his anger toward Roman – and increasingly Papal authority – grew steadily, influenced in part by *In Praise of Folly* (1511) by Erasmus of Rotterdam, a leading Hebraist and humanist, who criticized the practice of selling “indulgences.” On the eve of All Saints Day in October, 1517, Luther published 95 theses of his own criticizing the sale of indulgences. (The story about Luther nailing his theses to the door of the Cathedral is apocryphal. There were no eyewitnesses!) As his fame and notoriety grew, so did his theological daring. In the space of a few years, he went from criticizing a lucrative and hypocritical (but highly specific) practice of the Church to challenging the basic

legitimacy of the Pope's authority, eventually labeling him the "anti-Christ."

Luther and Erasmus

While he leaned on him initially, Luther broke with Erasmus and the humanists in 1525. Erasmus resembled Aristotle and St. Thomas in having some faith in our innate sociability, in our ability to govern ourselves, and in the efficacy of good works, carried out in the proper spirit, to ennoble and edify the human spirit (Green 1964). Some humanists and their fellow travelers, the Unitarians, even allowed for the possibility that Jews, Muslims, and Hindus, if they conducted their lives in a Christian spirit, could commend themselves to God and be welcomed into Heaven in the hereafter.

Heresy! thundered Luther. Salvation is always an unmerited gift of God. There is nothing we can do in this world to really merit salvation. Luther argued that works without faith are of no avail, and indeed are idolatry, and that only those who embrace Jesus Christ as their personal savior will enter the kingdom of heaven. By some accounts, at the end of his life, Luther hated Erasmus even more than he hated the Pope! Another contentious issue was that Erasmus and his circle interpreted scripture allegorically, for the most part, and made ample allowance for the existence of more than one valid interpretation of a text. Though not enamored of Aristotle, whose authority was generally invoked to stifle rather than to promote free inquiry, at least in those days, Erasmus and the humanists also acknowledged the wisdom of many pagan poets and philosophers, arguing that they are perfectly compatible with a Christian way of life. In short, they were averse to a rigid or doctrinaire attitude toward religious faith. Not so Luther. Though he put a selective emphasis on certain Biblical texts, and deliberately ignored others, Luther maintained that the Bible is the literal and infallible word of God. He also claimed to know precisely what the Bible meant in any given instance, even if the text itself was deeply obscure to other learned commentators who

were more deeply versed in Hebrew and Greek – like Erasmus.

Apart from their doctrinal differences, Erasmus was repulsed by the violence of Luther's feelings and exhortations and the copious bloodshed that accompanied the Reformation. Erasmus deplored violence and spotted Luther's tendencies in that direction early on. Reflecting on their disparate agendas, Erasmus said: "I layed a hen's egg; Luther hatched a bird of quite a different breed" (Green 1964, p. 164). Despite these differences, Luther and Erasmus shared the belief that the Bible should be accessible to all. In fact, Luther stressed that *all* men should read the Bible and pray in their own tongue, rather than in Latin. This doctrinal shift not only undermined the Roman monopoly on the reading and interpretation of scripture but placed a considerable premium on literacy, creating an urgent demand for public education – an idea unheard of in feudal times. Fortunately for Luther, it also coincided with the invention of the Gutenberg's printing press, and Gutenberg himself became a staunch ally, printing hundreds of Luther's pamphlets to spread opposition to Rome and its cunning machinations to enslave men's souls. But while it hastened the dissolution of the feudal order (and the creation of public schools), Luther sought to keep certain features of the feudal hierarchy intact. Luther's religious revolution undermined the ecclesiastical hierarchy in Rome but enjoined strict obedience to secular authority – even for unfortunate peasants who were thrust to the brink of destitution and beyond (Green 1964). Indeed, a pamphlet entitled *Against the Thievish and Murderous Hordes of Peasants* (1525) explicitly encouraged German princes to suppress peasant revolts with ruthless violence – which they did, of course.

Marxist and Freudian Readings

Luther's behavior in the peasant wars (1524–1526) invited a Marxist interpretation, and in 1936, Herbert Marcuse published a brief study on Luther in a series called *Studies in Authority*, published by Felix Alcan (Paris) and

reprinted in *Studies in Critical Philosophy* (Marcuse 1973). Marcuse construed Luther's authoritarian tendencies and his growing contempt for the peasantry as an early expression of a nascent bourgeoisie starting to flex its muscles, because it was linked, in his mind, to Roman law, which Luther studied before entering the monastery. (Roman law was used by the burghers of Luther's era to undermine or circumvent the legal constraints on commerce imposed by the Church.) In *Young Man Luther*, the best known biography of Luther by a psychoanalyst (Erikson 1958), Erik Erikson chided Marxists for being one-sided and reductionistic in their emphasis on economic motives and inattentive to the powerful "psychic reality" behind Luther's teaching. But even he conceded the element of truth in these approaches.

In 1941, Horkheimer and Adorno drew clear links between Luther's anti-Semitic statements and the then-current Nazi propaganda in a report on their "*Research Project on Anti-Semitism*" (Horkheimer and Adorno 1941). Initially, in more charitable moods, Luther had explained the Jewish refusal to convert to Christianity as rooted in a sensible mistrust for the Papacy and the pagan elements (including "Mariolatry") that Catholicism had introduced into Christian teaching. For a few years, Luther even deluded himself into thinking that once he had purged the Christian faith of these sordid accretions, the Jews would convert *en masse*. However, after many abortive efforts to convert local Jewry, in 1543, at age 60, Luther exhorted his contemporaries:

First, to set fire to their synagogues or schools.
 Second, I advise that their houses also be razed and destroyed.
 Third, I advise that all their prayer books and Talmudic writings, in which such adultery, lies, cursing and blasphemy are taught, be taken from them.
 Fourth, I advise that their rabbis be forbidden to teach henceforth on pain of loss of life and limb.
 Fifth, I advise that safe-conduct on the highways be abolished completely for Jews.

Sixth, I advise that... all cash and treasure of silver and gold be taken from them.

Seventh... Let whomsoever can, throw brimstone and pitch upon them, so much the better... and if this be not enough, let them be driven like mad dogs from the land (cited in Burston 2007, p. 115).

This inflammatory speech was not an isolated incident. Luther's last sermon was another attack upon Jews, and the Kristallnacht pogrom which swept Germany in 1938 was deliberately timed to coincide with Luther's birthday. Luther's utterances were often read in Protestant Churches during the Nazi era to incite violence and hatred toward Jews (Burston 2007).

Erik Erikson's biography *Young Man Luther* minimized Luther's anti-Semitic outbursts and his destructive attitude toward peasants, dwelling instead on Luther's audacity, originality, resilience, sincerity, and wit. While more sympathetic than many treatments of Luther's life, Erikson did strain credulity at times. He credited Luther's confessor, von Staupitz, with rare therapeutic abilities that supposedly saved the sanity of this prodigiously gifted but deeply disturbed young man and helped him find his "voice" and to trust his own, inner authority, though von Staupitz remained completely loyal to the Church. Odder still, Erikson interpreted a disputed passage in Luther's *Table Talk* to mean that the decisive moment in his religious development – Luther's epiphany – took place while he was evacuating his bowels. Erikson reasoned that for someone who suffers from chronic constipation, having a splendid bowel movement could easily engender a "religious" experience, an idea echoed by Norman O. Brown 2 years later, in *Life Against Death* (Brown 1960). If Erikson was right, Luther was the first (and perhaps *only*) specimen of *homo religiosus* to have his crucial revelation during the act of defecation. W. H. Auden welcomed Erikson's interpretation. According to Auden (1960):

There must be many people to whom religious, intellectual or artistic insights have come in the same place, for excretion is both the primal creative act - every child is the mother of its own feces - and

the primal act of revolt and repudiation of the past - what was once good food has become bad dirt and must be gotten rid of. From then on, Luther's fate became his own (Auden 1960, p. 17).

Well, perhaps. But if many people have religious experiences while defecating, very few actually report them. So the question becomes: why did Luther, of all people, have this experience? Or more to the point: did he, really? We may never know, but in retrospect, Luther's epiphany probably did *not* occur in the way or in the place that Erikson imagined it. Luther's account is worded more ambiguously than Erikson allowed and could be construed as saying that the blessed event occurred in meditation cells *adjacent to* the monastery's privy (Green 1964; Marius 1999). But whatever you believe on this point, the fact remains that Luther was an intriguing character. He attacked the selling of indulgences and cult of saintly relics with a clarity and indignation worthy of Voltaire. But he was also deeply superstitious, a believer in witchcraft, who claimed to literally "see" demons and evil spirits lurking about the Prussian landscape. As a good medieval cleric must, Luther dutifully reviled "the flesh," echoing centuries of Christian tradition. But he was bitterly opposed to priestly celibacy, spoke frankly of conjugal pleasures, and, in later years, ate and drank with deliberate abandon to "mock the devil" – or, as Erikson said, to chase away bouts of anxiety and depression. A man of great vigor and industry, who survived three epidemics of bubonic plague and lived to the age of 63, Luther was also a legendary neurasthenic, who was prone to bouts of constipation and dizziness and other diffuse bodily ailments. But for all his faults and frailties, Luther was still what Hegel termed a "world-historical individual," whose writings,

utterances, and deeds transformed the world irrevocably, for good and for ill. His illustrious contemporaries included Copernicus, Erasmus, Thomas More, Rabelais, and Machiavelli – the last of the medievals or first of the moderns, depending on how you juggle your historical schemata. Looking backwards, it is hard to think of a generation who had more impact on modernity than they. And with the possible exception of Copernicus, Luther was the most influential of them all.

M

Magic

Jeffrey B. Pettis

Department of Theology, Fordham University,
New York, NY, USA

Magic involves the practice of what is perceived to be the direct manipulation of material and spirit realms by human initiative. This action is meant to bring about definitive, tangible results. The Greco-Roman Egypt source entitled the Greek Magical Papyri (second century BCE–fifth century CE) provides an array of kinds and forms of magic used during this time. The spells, for instance, bring favor, produce a trance, drive out demons, question a corpse, induce insomnia, catch a thief, cause evil sleep, break enchantment, and induce childbearing. They occur as charms, oracles, dreams, saucer divination, magical handbooks, magical rings, astrological calendars, horoscopes, lamp inquiry, and magico-medical formulae. Many of the spells require complex procedures. To control one's shadow, the subject must make an offering of wheaten meal, ripe mulberries, and un-softened sesame. After making the offering, she must go into the desert on the sixth hour of the day and lay prostrate toward the rising sun, hands outstretched, saying a formula which begins: "Cause now my shadow to serve

me ..." (Betz 1986, PGM III: 612–632). The shadow will come before the face of the subject on the seventh hour and is to be addressed with the command: "Follow me everywhere." A charm for sending a dream requires picking three reeds before sunrise and incanting a formula after sunset while facing, respectively, east, south, west, and north (Betz 1986, PGM IV: 3172–3208). The range and extent of forms and purposes of magic relate the human desire to address the complexity of day-to-day life situations. They are meant as wish-fulfillment response to human limitation and anxiety. Coursing through the material there occurs the influence of ancient Egyptian temple religion, worship of the sun, and notions of the regenerative potencies in nature seen in the ritual practices of mummification. At the same time, these magical formulae are representative of a cultural syncretism which includes Babylonian, Greek, Jewish, and Christian religions and as such evidence the extent to which magic was used within the ancient world. By 13 BCE, however, the influence of magic becomes stemmed by Augustus' burning of 2,000 magical scrolls (Seutonius, *Augustus* 2.31). The early church reaction against magic as pagan practice contributes further to the suppression of magical handbooks and magicians. St. Augustine (d. 430 CE) makes it a point to say how the raising of Samuel from the dead by the witch of Endor (1 Sam.

28.8–25) occurred through the work of demons (*Ad Simplicianum* II, III). The Medieval text *De Magis*, which is part of a larger treatise entitled *Etymologies* by St. Isidore of Seville (d. 638 CE), denounces magic as having originated with *angelorum malorum* (“evil angels”). He says that “hidden knowledge” resulting in the taking of oracles and the raising of the dead (*dicuntur oracula et necromantia*) was first employed by Zoroaster, King of Persia, and even more by the Assyrians beginning with King Ninus (9.1-3). Subsequent church figures including Archbishop Hincmar of Rheims (d. 881) and Bishop Burchard of Worms (d. 1025) rely on Isidore to denigrate magic even further in their own writings. However, by the tenth and eleventh centuries, astrological handbooks reappear within the domain of the church. Demons are perceived to exist under the rule of the church and the raising of the symbol of the cross. Earth magic, which includes the supernatural marking of shrines, wells and springs, *sculptilia*, and *simulacra*, also emerges. The European Enlightenment and its focus upon reason and religious dissociation results in the eventual demise of magic, however, while contemporary intrigue seems to be occurring through attention given to books and films such as Harry Potter.

Maimonides, Moses

Mark Popovsky

Department of Pastoral Care, Weill Medical College of Cornell, New York Presbyterian Hospital – Chaplaincy, New York, NY, USA

General

Born in Cordova, Spain, Moses Maimonides (1135–1204) achieved fame as a rabbinic authority, legal codifier, philosopher, physician, and astronomer. Religious persecution sent him into exile throughout Spain and northern Africa before he eventually settled in Cairo serving as the physician to the vizier al-Fadil in 1185.

Philosophical Views

Strongly influenced by Aristotelian philosophy popular in the surrounding Muslim culture, Maimonides is regarded as the supreme rationalist of Jewish tradition. He asserted the doctrine of the incorporeality of God and devoted much of his major philosophical work, *A Guide for the Perplexed*, to reinterpreting biblical passages which suggest an anthropomorphic deity. Maimonides wrote the *Guide* in an effort to resolve the apparent contradictions between Aristotelian philosophy and traditional Judaism which were challenging the faith of well-educated Jews at the time. He argued that biblical texts have a spiritual meaning beyond their literal one – a meaning which points to the ultimate authority of reason. He attempted to prove the existence of God using exclusively Aristotelian terms without relying on the bible. Maimonides maintained that Jewish laws – even those of a seemingly ritual nature – are products of divine wisdom and, thus, wholly rational. In the *Guide* and in his work *The Book of Commandments*, Maimonides dedicates himself to explicating the rational principles underpinning particular Jewish laws.

As in Aristotelian thought, Maimonides believed that moral behavior, while important,

was simply a means to attaining intellectual virtue, the highest ideal. He argued that the mind's ability to reason represents the divine image reflected in human beings, and thus, individuals have a moral imperative to develop their intellectual faculties. Maimonides asserted that morality consists of following the mean which is attained as the well-cultivated mind controls a person's desires. In an exception to this appeal for moderation, Maimonides encouraged his readers to avoid even slight traces of anger or pride, and his later writings display an increasingly ascetic inclination.

In the *Guide*, Maimonides shows special interest in the interpretation of dreams and prophetic visions which he views as wholly natural events. Maimonides diverges from earlier Jewish tradition which generally regarded dreams as manifestations of divine communication. In a process similar to what Freud calls the "dreamwork," Maimonides interprets dream material by retracing how the dream was created in the mind of the individual, focusing on the latent context instead of the dream content itself. He argues that dreams mark the nexus point between the rational and imaginative faculties, two aspects of the mind that the Hebrew prophets and some later rabbinic figures were successfully able to synthesize.

In the *Guide*, Maimonides put forward the argument that ascribing any individual attribute to God denies God's unity and omnipotence. Consequently, one may only speak of what God is not (i.e., God is not nonexistent.), but one commits heresy when attempting to define what God is. Similarly, Maimonides held the Neoplatonic doctrine that evil does not exist independently but simply reflects an absence of good. While arguing that the world as a whole is good, Maimonides attributed the suffering that individuals experience to divine justice and man's misuse of free will. He rejected the claims of previous Jewish philosophers that God intentionally causes suffering to a righteous person in order to reward that person in the afterlife. Maimonides' own view of the afterlife drew heavily from the Hellenistic model of the immortality of the soul, downplaying rabbinic notions of physical resurrection.

Legal Writing

Maimonides did not write exclusively for the philosophical elite. He is most famous among Jews today for his legal code, the *Mishneh Torah*. This 14-volume work endeavors to distill the whole of rabbinic literature, rich with arguments, tangents, loose associations, and dialog, into a systematic and comprehensive catalog of conclusive legal rulings in clear Hebrew accessible to the lay reader. The topics covered include family law, torts, criminal law, and ritual practice. The code also contains within it a complete system of metaphysics, refutations of Christianity and Islam, and a discussion of eschatology. This project was controversial from its inception, drawing criticism that Maimonides was interpreting previous legal debates idiosyncratically and denying his reader access to dissenting arguments. Nevertheless, the code gained immediate popularity throughout the Jewish world, strongly influencing the language, structure, and content of Jewish legal writings into the modern era.

Male God Images

Annette Peterson
Riverside, IL, USA

God images are psychological constructs of thoughts and feelings, coalesced into a complex relational gestalt. God images were once critiqued

by psychologists of religion as projections, personifications to be rejected. Now they are recognized by contemporary psychologists of religion for their ability to provide psychological strength and resilience. They provide structure and improve functioning on the individual and the social level by helping us internalize a moral code and a shared world view.

Male God images hold sway over the mainstream religious imagination, affecting conscious and unconscious cultural mores and theological traditions. Male God images are particularly effective in structuring and strengthening the individual and his/her society. Replicating the Western traditional father's role of provider, role model, and disciplinarian on the cosmic stage, male God images provide a sense of belonging, safety, and a clear moral compass. However, these benefits are not without risk: these God images may also cause us to suffer perpetual childhood, gender imbalance, and guilt/shame complexes.

In the triad of Western monotheisms, Judaism, Christianity, and Islam, gendered and sexualized language is used to express the divine nature. Although Islam eschews divine images, the male referent is used. In the Judaism and Christianity, as in the Bible, masculine language for God is overwhelmingly predominant. God is consistently depicted in a paternal role, as external to but actively involved in his creation. God is a divine king, lord over all the universe, husband to his chosen nation of Israel, and father to us all. The father-child relationship functions particularly effectively as a metaphor for the relationship between God and humans. The term father conveys authority as well as kinship.

The dominant God image of recent history is of a male, divine king, who rules over all, meting out justice, demanding obedience, caring for those on his good side, and smiting those who fail to please. This historical trend dates back several thousand years to early urban civilizations. Although earlier tribal societies favored more animistic (nature/animal Gods) or feminine (Earth Mother) God images, when humans coalesced into larger societies, the male God image was strengthened as a way of stabilizing the social

structure and enforcing a shared code of ethics (Edinger 1996). Cultures who serve a "divine king" will achieve a greater civilization than if these roles are disparate or conflicting.

Although male God images may strengthen us culturally, they can weaken us individually. Sigmund Freud critiqued the male God image of mainstream monotheism as a projection of our earthly fathers onto the heavens. Freud declared, "God is in every case modeled after the father, and that our personal relation to God is dependent upon our relation to our physical father, fluctuating and changing with him, and that God at bottom is nothing but an exalted father" (1918/1950, p. 244).

Freud dismissed God as a glorified father figure and rejected religion as a psychological crutch based in illusory wish fulfillment (1928/1975). He believed that we would remain psychologically crippled until we rejected our parentified God images. Freud compared our projection of the divine father to the story of Oedipus, with God as a psychological creation to assuage our guilt for having usurped our earthly fathers and as a means to maintain a sense of perpetual childhood, buffered and cradled by God. With God the Father as the ultimate authority figure, it is easy to shrug off free will and personal responsibility and bow to God's greater will.

Since Freud, psychoanalytic object relational theory has elaborated and amended the Freudian critique with studies demonstrating the validity of the parental projection theory. However, these studies have correlated God images with early images of both father and mother and often the preferred or opposite-sex parent (e.g., Beit-Hallahmi and Argyle 1975; Rizzuto 1979; Vergote and Tamayo 1981). Further, these studies have corrected Freud by showing the positive effects of the God relationship, demonstrating that it provides psychological strength and resilience.

Carl Jung offered a different perspective on the God-as-father hypothesis. Rather than a larger than life father figure, Jung believed that the God image is an archetype, or symbolic representation, of the self. He wrote, "[O]ne can never distinguish

empirically between a symbol of the self and a God-image, the two ideas, however much we try to differentiate them, always appear blended together” (Jung 1958, p. 156).

If the God image is also a self-image, its examination reveals much about the psyche and its complexes. The God image may reflect our personal world view on a cosmic level, or it may be an idealized image that compensates for our inherent deficiencies.

The male God image appears to be a conglomerate of parental and self-images, a synthesis of our relational experiences and expectations that is coalesced into a singular divine person. The God image provides an anchor in our relation to the divine, yet it is also flexible, changing alongside our own faith development. In theories of faith and spiritual development, the personification of the divine occurs in the middle developmental stages and later gives way to a more universal, inclusive God image (Fowler 1981; Genia 1995; Meissner 1984). With developmental maturity, the God image has greater tolerance for diversity and ambiguity. It is possible that a parallel developmental trajectory also exists in our collective cultural God image development, and gendered, personified God images may gradually give way to more transcendent and inclusive God images (Edinger 1996; Peterson 2005).

Commentary

God images can deepen our connection to ultimate reality, but they can also limit or distort our ability to encounter it. A God image based on one’s father unavoidably has both positive and negative psychic consequences. Even within a single God image, qualities of God-as-parent have equal and opposite ramifications. For example, a God who provides safety can also be perceived as restrictive; a God who provides for our needs usually requires much in return; a God who gives loving approval can also be a source of rejection.

Similarly, a God image based on our self-image can limit our openness to experiencing the divine.

The masculine emphasis in prevalent God images is symptomatic of psychological misalignment. Jung argued that a healthy God image needed to reflect the balance of male and female, which he called *anima* and *animus*. A gender imbalance results in psychological one-sidedness, limiting freedom of experience and expression. This problematic imbalance occurs on individual and cultural levels and has resulted in fierce polemic debate.

Feminist theologians have argued bitterly against male-only language for God. They believe that God’s maleness deifies the masculine, which appears as divine sanction for patriarchy and the devaluation of women. Male God images, therefore, perpetuate injustices against women in societies across the world.

Mary Daly quipped, “If God is male, then the male is God” (1973, p. 19). The dominance of male God images has been used to elevate men in society under the belief that male authority is God given and sanctioned.

In verbalizing our experience of God, both male and female traits are needed. However evident this may be from a psychological perspective, it remains a source of theological debate in religious circles. Biblical precedent (e.g., 1 Corinthians 11:7) is used to argue for solely masculine names/titles for the divine, even to assert that women do not bear the image of God to the extent that men do. Theologians debate over whether the masculine language is culturally dependent or self-revelatory. In view of the furor involving gendered language for the divine, it is helpful to step back and acknowledge the radical difference between human sexuality and divine reality. God by nature encompasses and exceeds all our efforts to express “him.”

Mandala

Lee W. Bailey
Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

The Sanskrit word *mandala* means “circle” – circular images drawn, built, painted, danced, or lived, expressing many qualities of nature and culture. Many mandalas are unnoticed images of peace, power, oneness, and transcendence.

Mandala, Fig. 1 Double sand spiral by Jim Denevan at Ocean Beach, San Francisco, March 6, 2005. (jimdenevan.com. Photo courtesy of the author. Public Domain)

Circular fountains in cities, for example, simultaneously send out a circle of energy and bring to the “center” the community around it. Mandalas are a sacred visual art about the silent center within, the endless circumference without, an art with psychological, biological, and spiritual significance. Some are evident in nature and others products of art and religion. Cultures embroider the form with many unique variations. The focus is often on the center of the circle, which is commonly a geometric symbol of the eternal source. Mandalas with symmetry imply a tension or balance and harmony of spiritual forces. The mandala is an orienting map of the soul, the world, and the cosmos, a microcosm and macrocosm (Fig. 1).

Natural Mandalas

We live amid nature’s own wondrous mandalas – flowers, age rings of a tree trunk, or the cycling of

the Earth and celestial lights. Sit quietly and watch a shadow move along and feel yourself sitting on the vast Earth's globe rotating around its axis, through its seasons. Enjoy a campfire circle in the darkness, friends linking souls, and fire thrusting and sparking upward. Feel the cycles of your breathing. Think of the plant cycles, such as trees, that absorb the carbon dioxide we breathe out and produce oxygen for us to breathe in. Sit by a stream and recall the cycle of water rising in mist to the sky, drifting in the wind as clouds, then falling in life-giving rain, flowing over waterfalls to the ocean. Wonder at the complex variety of circular seashells – delicate sand dollars or spiraling conches. Study snowflakes, their tiny, delicate crystalline, symmetrical structure, each completely unique in design. Look at a satellite photo of a vast hurricane swirling in a powerful circle.

As you grow up and grow older, think of the birthdays, births, and deaths of your life as part of Earth's life cycles. These simple yet cosmic wonders are doorways to a higher consciousness and infinite power beyond mundane consciousness. Intuitively, we can see in them reminders of our place in the grander scheme of nature. This opens up their sacredness, the geometry of life, and the endless beyond within it. The cosmic cycles of reincarnation are a basic assumption of Asian religions, so historical time and life experiences are believed to be cyclical, not linear.

The ancients personified the sky's magnificent powers with the circles of starry astrological symbols, such as Taurus the Bull, as divinities in daily cycles, and closer stars as gods and goddesses, such as Venus and Jupiter, in planetary processions. The beauty they emanate has long seemed to be a channel to the divine.

Animals also live with cycles. A circular bird nest is the safe haven home for the oval eggs of a new year's generation of the winged nation. The old image of the serpent, which sheds its skin as it grows, in a circle eating its tail, or wrapped around an egg, evokes the cycle of life eating life and birthing it again (*uroboros*). The complex eyeball is a circle that draws the visual and soulful world into our brains and connects us with the world. Watch the seasonal cyclical migration of birds such as graceful geese, honking in their

formations as they fly thousands of miles north and south each year. Remember the hidden fish and whales that also migrate long distances with the seasons to reproduce underwater, replenishing the Earth.

The plant nation also springs forth with many circles, from the sunflower's whirled center to the unfolding delicate beauty of a royal English rose or royal Chinese peony. Flowers, the perfumed sex organs of the plant world, symbolize at weddings the beauty of erotic love and family fertility and at funerals the beauty of human and eternal life. The Christmas tree is a mandala, a miniature cosmos on an axis mundi with lights like tiny suns, globes like planets, and soul symbols such as children's toys all around. The lotus is an image of the divine in Asia. Hindu gods and Buddhas sit on lotus thrones.

The mineral world has its mandalas, also, from common rounded stones washed smooth by running water to precious diamonds, shaped in a circle to reflect the divine treasure of light. Gold wedding rings symbolize the loving union of marriage. The stone seen as the center or belly button of the world, *omphalos* in Delphi, or the central Kaaba stone in Mecca for Islam are world-orienting mandalas. Stone circles, notably England's Stonehenge, over 5,000 years old, apparently a cosmic calendar, mark for the ages the cycles of nature, such as the solstices. Egyptian, Mayan, and many other pyramids are model holy mountains, often four-sided, orienting to earthly directions and pointing above to the eternal divine powers. The Egyptian pyramids are positioned to imitate the belt of the Osiris [or Orion, in Greek] constellation of stars, toward which the spirit of the deceased Pharaoh was to ascend Earth artists are still making mandalas (Fig. 1).

Mandala Psychology

Carl Jung, after undergoing a confusing period of encounters with unconscious material, began in 1916 to draw mandala images spontaneously, at first not knowing what they meant. As he came to understand it, he saw the mandala as a picture of the complete soul, conscious and unconscious,

with the center as the pointer to an authority far larger than the ego, which he later called the “Self,” or psychological experience of the divine within.

Jung collected numerous mandalas drawn by his patients (Jung 1979, Vol. 9, Pt. 1, para. 627–712). They pictured images sometimes seen in dreams: squares, circles, spirals, flowers, crystalline reflections, geometric multiplications, eyeballs, animals, light rays, serpents, fish, or a glowing egg. Jung saw circular UFOs as mandala symbols in machine form, bringing cosmic energies down to Earth. He found that mandalas reduced confusion and panic and introduced order, balance, and wholeness. Mandalas, he saw, urge one to become more truly what one is, overcoming fear and chaos and balancing opposites, guided by the healing energy of the central image. In his translation of *The Golden Flower*, Richard Wilhelm introduced Jung to Chinese mandalas. Jung envisioned a shadow negative force in each archetypal image, so in our time, a shadow of the mandala would be the swastika, which Hitler took from a Hindu tradition and transformed its meaning into one of hatred and death.

Here is an example of the dynamic energy that a mandala can have. A college girl, scornful of religion, sullen, and sad, had a dream of an energetic three-inch sphere, which she found in a field, which suddenly came alive, pulsating with lightning bolts, driven by dangerous electricity. The threatening ball swooped around her as the sky became menacing. She ran and ran, until the ball faced her as she gave up and repeatedly cried out “I do believe in God!” The sky calmed, the now lifeless ball dropped to the ground, and flowers grew all around. She woke up in a sweat and soon became a Religion major (Federico 2008). This sphere emerged from her unconscious soul with a fright that transformed her consciousness into a search for spiritual peace.

Indigenous Peoples

Of all the indigenous peoples’ mandalas, we can note a few. Many dance in a circle around a fire,

and some prefer to live in circular tipis. The Mexican God’s Eye of cross-shaped sticks is woven with brightly colored threads, making a diamond shape. The great Aztec Sunstone has at its center the symbol of the present age *Ollin*, surrounding with calendar and cosmic images, two cosmic fire serpents, and pictures of a coming cataclysm. The Australian Aboriginal Tjuringa stone shows the map of the journeys of the Ancestors of the Dreamtime. They build large mandala circles made of natural colors and feathers in the desert, covering two or three acres.

Celtic mandalas are full of endless knots – ropes and vines twined in and out of each other in manifold knots, like a maze or pilgrimage through life, not to be untied, but to be followed in its endlessness. Some have women entwined as in a dance, or men whose beards are entwined with their limbs, as if swimming in a wild lake of seaweed. Others have the tidy order of linear lines and crosses or triangles. Beastly creatures chase each other in a circle, paws entwined. One anthropomorphic mandala celebrated in carved circles on United Kingdom churches, in dances, and in processions, is the Green Man, whose beard is entwined with wings, leaves, and branches. Leaves may grow out of his mouth (Holitzka 1996).

In Native American mandalas, the four directions often appear, pointing to the horizon, the powers and colors of the cardinal directions, and the cosmic forces they embody. Feathers and wings carry the powers of the winged beings of the sky. In the Lakota Sioux shaman Black Elk’s great vision, he saw a cloud tipi in the center of a camp with grandfathers in it who gave him powers, and four ceremonial horses dancing at each of four directions (Neihardt). Some Native Americans make circular dream catchers or outdoor stone circles in places of power. Navahos make sand mandalas for healing ceremonies, seeking to balance spiritual forces to overcome sickness. Some call mandalas “medicine wheels.” The dazzling sun may send its rays in a mandala circle mixed with images of serpents, humans, lizards, and shimmering zigzag lines.

Rock drawings, or petroglyphs, may be mandalas marking a vision, a spirit, an ancestor spirit, or a deity, such as a rain god. Animals are prominent, such as the wolf, bear, eagle, or buffalo. The peace pipe, bows and arrows, jagged “thunder arrows” of lightning, or a thunder bird illuminate some mandalas. The Great Mother and her growing plants, or male figures, may stand arms upraised or dancing. A ritual such as the Plains peoples’ sun dance has the cottonwood tree in the center, warriors dancing around it in a circle, tipi lodges around them, mountains, and clouds, all pointing upward to the Great Spirit.

Flowers may grace a mandala, or the spiral of a tornado with jagged lightning powers swirling toward the center. Horses may stand in lines facing the central sun, with a surrounding image of a Great Spirit. A basket or plate often has woven images of human figures, spirals, suns, abstract geometric designs, or sacred foods. A Pueblo kachina dancer with elaborate mask and imagery such as wings may dominate a mandala. These images convey the powers of the universe that appear in nature, for in many forms, the ancestor spirits and the Great Spirit live in all the world (Holitzka 2000).

Judaism

The Jewish Star of David is a mandala, with two inverted triangles intersecting. Jerusalem and its ancient temple mount is the geographic center of historical Israel, so this holy land is the central focus of the faith. Jewish traditional dances frequently move in a circle. The family dining table is also a central focus of Judaism. Torah scrolls are cylindrical mandalas of sacred texts. The menorah candelabrum is a half circle of nine candles, an ancient symbol of Judaism. The tree inspired Jewish Kabbalist mystics to organize their metaphysical vision of the universe as a tree, a circle on an axis. The top is the Ein Sof, the infinite creative spirit, and the various revealed aspects of God (Sepiroth) take their place as branches, until the bottom is reached as the Shekinah, the presence of God for humans.

Christianity

The labyrinth is an archaic symbol adopted by Christians, a maze, perhaps meant to trap evil spirits. At the Cretan palace of Knossos, there are reports of a labyrinth as a dancing ground, and the myth of the Minotaur at the center. Pliny reports others in Italy and Lemnia, and, like Pliny, Herodotus records a huge labyrinthine building in Egypt (Herodotus 1966, p. 161; Eichholz 1962, Book 36, p. xix; Ramsay 1875, pp. 664–665). Some ancient versions seem to induce confusion and being lost or trapped. Some were later altered to focus on finding the center and then a Way out. They were made with stones and bushes, and one notable one remains in the floor just inside the entrance of Chartres Cathedral in France. The one in Reims Cathedral is more square (Paroisse) with four larger corners, and the Virgin Mary at the center. The one at Amiens Cathedral is square. The winding passages portray the sufferings on this Earth, and the center depicts the divine peace. The journey is a descent into oneself to find inner divinity. A twenty-first-century revival of labyrinth meditative walking began at Grace Cathedral in San Francisco (Artress 1995).

The cross is also a mandala, focusing on the center of meaning in the faith, the incarnation, and sacrifice of Christ, which stripped his humanity bare, returned his spirit to the center of being, and left the Holy Spirit on Earth. The Latin cross has one long side. The Celtic cross has a long side with a small circle around the center of the cross inscribed with designs. Eastern Orthodox crosses may have the four sides of equal length, or an angled short piece on the longer side. The circular stained glass rose window is a large mandala in churches with pictures and colors illuminated by sunlight, developed by Gothic cathedral designers. Cathedral ground plans are cross-mandalas with high ceilings or domes.

Islam

Muslims worldwide face Mecca when they bow in prayer, forming a vast human mandala. At the

Hajj pilgrimage journey to Mecca, itself a mandala journey, there is the central ritual circumambulation of Kaaba stone in the Great Mosque. The new moon and nearby star are a Muslim symbol, appearing on the flag of Turkey. The huge dome in many mosques symbolizes the arch of heaven, and the typical four minaret towers at the mosque periphery form a symmetrical square. Muslim art forbids human images, so many designs, as on Turkish tiles, include symmetrical plants and calligraphy. Classic carpet designs often have mandala designs. The mystical Whirling Dervishes dance in a circular spinning form.

Taoism

Chinese Taoism emphasizes the ancient Yin-Yang circle, in which black and white halves flow into each other and each contains a circle of the opposite within itself, showing the inadequacies of rigid dualisms, flowing paradoxically in tension and harmony in the Way of deepest eternal mysteries. The *Tao te Ching* says: “The Tao is an empty vessel; it is used, but never filled. . .hidden deep but ever present” (Lao-Tzu 1972, poem 4).

Tibetan Buddhism

Today’s most complex mandalas are the colorful Tibetan Buddhist sand mandalas. They are elaborate, detailed circular designs made with colored sand by monks, with well-developed metaphysical interpretations. A mandala in Tibetan Buddhism is a map of the spiritual cosmos, an axis mundi, a cosmic center whose purpose is, like smoke going up the smoke hole of a circular tent, to commune with the transcendent realms. This results in a sacred spiritual transformation for those who make it. Tibetans believe that the mandala was invented by the Buddha, who is said to have designed the first Kalachakra (“time-wheel”) mandala after reaching enlightenment. A *yantra* is a purely geometric mandala, with no deity pictured, typically with several overlapping triangles.

Another type of Tibetan mandala is the “world wheel,” held by the god of death Yama, portraying the various forms of suffering in the world, from the central rooster (lust), snake (envy), and pig (unconsciousness) to death holding all the Earth’s suffering, surrounded by garden-like, peaceful trees, ducks, clouds, and birds.

A master monk supervises the highly liturgical mandala construction for a novice initiate. A deity is commonly pictured at the geometric center and is the central theme of a mandala. The making of a mandala is a ritual of restoring the ideal principles of things to Earth. The adepts involved both bring the cosmic energies down into the mandala and reawaken the immaculate principles within themselves. Giuseppe Tucci describes the ritual of making and contemplating a mandala as an “epiphany”:

...[one] comes to be identified with the center of the *mandala*, the point from which all goes forth and to which all returns and from where the archetypal essence stream forth in luminous rays which pervade the whole world. . . (1973, p. 105).

The mandala is intended to balance, like spokes around the center of a wheel, the confused mixture of earthly passions and consciousness, good and evil. In some mandalas, a god and goddess may embrace in Tantric fashion, making love to release the inherent Buddha nature. Other mandalas reflect the Kundalini tradition of locating various archetypal cosmic powers on the line of the spine, rising from the most coarse to the most refined, each Chakra spot symbolized by a mandala. The most important dynamic of the making and contemplation of a mandala is to visualize a divine principle or Buddha, bring it down from the transcendent realm, realize that it is already in one’s own heart, and awaken it.

Kalachakra Mandala

The Tantric Kalachakra mandala has roots in Indian tradition. The “wheel of time” was the favorite of the 14th Dalai Lama. Making it is to promote spiritual peace in individuals and on

Earth. It portrays a square divine palace within a circle of colorful symbols, full of deities. Journeying toward the center, the god Kalachakra is visualized embracing his female partner Vishvamata in his arms. He is the sun; she is the moon. Together, they unite compassion with absolute wisdom. In the center is the Tibetan blue *vajra*, symbol of the diamond scepter or thunderbolt. This the participants must melt into, in order to be purified and be reborn beyond this world into the pure essence of the emptiness of the absolute (Crossman). When the mandala ceremony is complete, the sand is swept into a container that is returned to the Earth or waters, an expression of the impermanence of all things, even sacred mandalas.

Industrialism

The industrial era also has its unconscious mandalas, such as the early oversimplified model of the atom as a miniature solar system with a nucleus surrounded by cycling electrons, symbolizing the foundation of material/electronic existence. The culminating space age mandalas are the images of Earth seen from the moon and about 150 billion galaxies seen from satellite telescopes in deep outer space. Thus, for many, space travel consciousness has morphed from a proud image of technological space conquest to a more awesome vision of the delicacy of our home in the vastness of space, needing ecological harmony, more than the spirit of conquest of nature. So far, the astronaut most changed by his cosmic vision was Edgar Mitchell, aboard Apollo 14, the second trip to the moon, experienced a mystical transformation of his “dyed-in-the-wool atheism.” Looking at the magnificent view of Earth and outer space, he:

experienced a grand epiphany accompanied by exhilaration nothing short of an overwhelming sense of universal connectedness. I actually felt what has been described as an ecstasy of unity the molecules of my body and the molecules of the spacecraft itself were manufactured long ago in the furnace of the ancient stars that burned in the

heavens about me There was an intelligent process at work. I perceived the universe as in some way conscious (Mitchell 1996, pp. 3–4).

While in a minority among space scientists and engineers, Mitchell’s psychological and spiritual transformation was profound. On his return, he founded the Institute of Noetic Sciences (<http://noetic.org/>).

Mandala and Faces

Claudia Bader

Institute for Expressive Analysis, New York, NY, USA

This entry discusses how mandalas resonate to the experience of seeing the face. This author has noticed that the face and the mandala share the same underlying geometry, implying another level of the power of the mandala in the human psyche.

Mandalas are geometrically based forms which evoke a sense of the sacred, personally and universally. Mandala is a Sanskrit word for circle or a disk-shaped object. This circle has special qualities, combining the ideas of circumference and center at the same time. Just as the definition is integrative, the form of the mandala integrates opposites in its geometry. The eternal aspect of the circle, which has no beginning and no end, is combined with quadrated forms, most commonly a cross within a circle (Fig. 1). In Buddhist art, they are most often painted meditation devices.

A circle on a page creates an inner and an outer space; in art therapy this quality is used for

Mandala and Faces, Fig. 1 Basic geometry of a mandala

Mandala and Faces, Fig. 2 Basic circle of the mandala

reflection on the self, as well as the centering and containing aspects of the form. A recent replication study reaffirmed that coloring in mandalas did reduce anxiety, more than coloring a plaid design or coloring on a blank paper (van der Venet and Serice 2012) (Fig. 2).

The Face

The importance of the human face has long been observed. Karen Machover (1971), a pioneer in “draw a person” projective tests, made a number of points about the significance of the face. Faces are the most individually identifiable part of our physical being and the most constantly visible. She stated that subjects, when asked to draw a person, no matter their age, often offer a face or head as the completed drawing. Body parts, such as torsos, legs, or arms, are never drawn on their own to represent a person (Machover 1971, p. 40).

Mandala and Faces, Fig. 3 Copy of an early scribble

Seeing and being seen is a face-to-face encounter. Before we can crawl or walk, we are held. Much of our time in early life is spent gazing into our mother's face. Winnicott (1971) was acutely attuned to the importance of the face; he made the point that when the infant sees the mother's face, what he sees is himself (p. 112). Winnicott also recognized that there is mutual response between mother and baby, with the face the crux of the communication. Beebe (2005), citing Bower (2001), states "Research using brain imaging suggests that faces enjoy special status in the brain. . . neural activity in the temporal lobes . . . surges twice as much when adults watch faces vs. other objects." She also makes the point that "Facial communication operates. . . largely out of awareness" (pp. 90–91). Eigen discusses the human face, talking about it as the most significant "organizing principle in the field of meaning" (Eigen 1993, p. 56).

In early developmental art, the mandala form and the face are interconnected. Mandala forms emerge very early on, in the scribbling stage which occurs from 18 months to 4 years old on average. These forms are one of the graphic precursors to the first drawn faces, and these earliest faces have a mandalic structure. Children start to draw around 18 months old. Before a child can draw a recognizable face, his or her drawings go through several stages: random marks like squiggles and scribbles (Fig. 3). Children practice combining shapes and squiggles; Rhoda Kellogg (1970) calls these combines. One of the earliest combines has a mandaloid form (Fig. 4).

Mandala and Faces, Fig. 4 Copy of typical mandaloid scribble (2 years old)

Mandala and Faces, Fig. 5 Copy of a typical 3-year-old drawing of a human

The earliest images of humans usually have a mandala formation, with a huge head with markings at the approximate place of the cross in a mandala (Fig. 5).

Another aspect of the mandala's power may be connected to the geometry of the face, for the face has a mandalic structure. In learning to draw, artists are trained to see the underlying geometry in physical form. To draw a face with accurate proportions, you learn that the space from the top of the head to the eyes is approximately the same distance as the eyes to the chin (Edwards 1989, pp. 141–142). As far as a mandalic structure is concerned, the horizontal axis is the eye line and

Mandala and Faces, Fig. 6 The basic geometry of the face as learned in drawing

the vertical axis being the line created by the nose. This is similar to the basic structure of the mandala (Fig. 6).

Psychological Aspects of the Mandala

The levels of psychological resonance of the mandala may be thought of in this way: the circle of the mandala creates a symbolic holding environment like the circle of mother's arms. The face has a loose circular form, and in the face are the eyes, concentric mandalic forms. Finally, the core facial architecture is similar to that of a mandala, the circle with a quadrated form. Thus, the mandala may evoke the face, our earliest mirror, the early holding environment of our mother's arms, as well as the experience throughout our lives of looking into faces, our most human aspect.

Mandala in Jungian Depth Psychology and Tibetan Buddhist Tantra

Judson Davis

School of Interdisciplinary Studies, Woosong University, Daejeon, Republic of Korea
University of Freiburg, Freiburg, Germany

Introduction

For countless millennia, the mandala has manifested in the religious iconography and cosmological symbolism of an array of diverse cultural traditions (Jung 1972), and in contemporary times it continues to hold an especially exalted place in the tantric practice of Tibetan Buddhism. Since the early twentieth century, in correlation with the pioneering work of Carl Jung, the mandala has also been understood as a fundamental symbol of psychological wholeness, and this primordial image thus serves as a distinctive connecting link through which to explore the

overlapping characteristics and sometimes striking similarities between these otherwise disparate spiritual disciplines (Davis 2016).

Although each tradition arose in substantially different cultural, geographical, and historical circumstances, and despite the fact that each espouses distinctly contrasting notions of an ultimate ontological reality (the disparity between the Jungian *Self* and the Buddhist no-self being a primary example), both systems emphasize the mind, or psyche, as the foundational basis of existence and the primary means through which liberation (in the Buddhist tradition) and psychic wholeness (as found in Jungian psychology) are pursued (Moacanin 2003). Further, both disciplines employ artistic expression and creative visualization practices as powerful agents of healing and transformation, and each system variously incorporates mythic images and wisdom figures – including those that arise in dreams and visionary experience – into its transformative processes. Among these various images and symbolic forms exists the mandala, which for both traditions variously exemplifies the totality of existence in which all opposites have been reconciled in correlation with the union of masculine and feminine principles.

The Mandala in Tibetan Buddhism

Having originated in India some 2500 years ago, Buddhism arrived on the Tibetan plateau in the seventh century C.E. during the reign of King Songsten Gampo (Tucci 1970/1980). The acceptance and expansion of this imported religion was greatly accentuated through the work of the renowned mystic Padmasambhava and the monk Santarakshita, and in about the year 779, it was officially indoctrinated through the founding of the first great monastery at Samye.

The tantric form of Indian Buddhism that was absorbed on the Tibetan plateau is known in Sanskrit as *Vajrayana*, the Thunderbolt or Diamond Vehicle (Gyatso 1995). This esoteric system emphasizes the use of such contemplative practices as creative visualization, artistic expression,

mantra recitation, the enactment of *mudras* (ritual poses), dream yoga, and various forms of meditation in order to facilitate spiritual development and ultimate liberation. Ultimately all of the various practices, methods, and rituals described above share one fundamental aim – the awakening to the truth of *Dharmakaya*, the timeless, indivisible, all-encompassing, and unchanging nature of the enlightened mind.

The most prominent symbol of enlightenment in Tibetan Buddhism is the mandala (Leidy and Thurman 1997). Predating historical Buddhism by many centuries, the word *mandala* is an ancient Sanskrit term that loosely translated means *circle*. Further, from early on this term had “the generative meaning of a circle as a universal symbol for womb, for breast, for the nurturing source of life” (p. 130). It may also pertain to,

any circle or discoid object such as the sun or moon. In etymological studies, it is sometimes divided into *manda* – best part, highest part, highest point – and *la* – signpost or completion. The combination is explained as a place or point which contains an essence. In the Vedic *Brahmanas*, some of India’s earliest and most influential pre-Buddhist philosophical texts, *mandala* already signifies a sacred enclosure and is, at times, understood to mean a place created for the performance of a certain ritual or practice, or for the use of a great teacher or mystic. (p. 17)

Mandalas in the Tibetan tradition are produced with a number of different materials that include thread, sand, and even butter, but the most immediately recognizable forms are the brightly colored paintings typically referred to as *palace architecture* mandalas (Leidy and Thurman 1997). In an external sense, these mythic forms represent a diagram of a cosmos, and in an internal sense, they serve as a guide, or path, to spiritual liberation. Such mandalas exemplify a sacred precinct in which a center, or central point, is understood to represent the ultimate source of all that is – limitless and absolute, yet containing a center. These complex and elaborate forms are typically comprised of,

an inner circle containing a principle deity (or deities). Enclosed in a multi-level square palace with openings at the four cardinal directions, the

palace is placed in a multi-tiered circle. Additional figures are generally found outside this large circle. (p. 17)

As a sanctified space, the palace, which may also be depicted in the form of a temple, constitutes a kind of sacred architecture that is designed as a generative container of a profoundly transformative spiritual metamorphosis (Leidy and Thurman 1997). The mandala's intrinsic structure and design thus reflect "a matter of imaginal world-patterning directly affecting inner structuring of physical and mental senses through actual brain organization" (p. 143). Accordingly, both the creation of and meditation upon such forms elicits a dynamic inner movement toward harmony and wholeness, which in turn extends the personal boundaries of the practitioner to include a merging with the outer environment and the totality of being. This transcendence beyond the personal self is absolutely fundamental to this process because,

in Buddhist usage, a mandala is a matrix or model of a perfected universe, the nurturing environment of the perfected self in ecstatic interconnection with perfected others. It is a blueprint for buddhahood conceived as attainment not only of an individual's ultimate liberation, but also as the attainment of such release and bliss *by an individual fully integrated with his or her environment and field of associates*. . . . Within the vision of tantra as a world-creating process, mandalas are models used for creating Buddha-worlds. (p. 127)

Mandalas thus serve as both sacred representations of ultimate liberation as well as powerful agents of instruction and transformation, and in Tibet this consecrated mythic form has been guiding tantric practitioners for more than 1200 years.

The Mandala in Jungian Depth Psychology

The mandala also holds a special place in the tradition of depth psychology, and played a particularly crucial role in Carl Jung's life and work (Jung 1963). His first rendering of a mandala occurred in 1916 in response to a period of extreme inner turmoil that arose following his break with Sigmund Freud. During this period of

psychic upheaval, he began to spontaneously draw and paint mandalic forms, and Jung found that this process provided both psychotherapeutic relief and a degree of psychic cohesion to his fragmented condition. Toward the end of the First World War, his symptoms began to subside, and he observed that the restoration of his psychological well-being was aided significantly by his drawing and painting of mandalas, many of which are impressively portrayed in Jung's (2009) *The Red Book*. As a result of this process, Jung concluded that such forms emerge as part of the human psyche's inherent mechanism for the healing of inner fragmentation. He therefore determined that this dynamic symbolic form not only exists as a very effective therapeutic tool but also constitutes a potent representation of psychic unity and wholeness. Jung reflected on his discoveries as follows:

I sketched every morning in a notebook a small circular drawing, a mandala, which seemed to correspond to my inner situation at the time. With the help of these drawings I could observe my psychic transformations from day to day. . . . My mandalas were cryptograms. . . in which I saw the self—that is, my whole being—actively at work. (1963, p. 195)

As noted in the above passage, Jung (1963) observed that during this long period of psychological discord, an unconscious aspect of his being was "actively at work" providing the creative impetus for the manifestation of these mandalas, which in turn served as the very instruments of his recovery. And it was the creative formulation of these images (which also arose in the dream state), and the resulting calm and psychic cohesion they produced, that led him to the conclusion that "the mandala is the center. It is the exponent of all paths. It is the path to the center, to individuation" (p. 196). In time, Jung would refer to this "center" as the *Self*, which represents the totality of one's being and exists as the very source to which the process of individuation (i.e., psychospiritual development) is directed. The mandala thus represents the human psyche in a state of wholeness, or completion, and at the same time serves as a dynamic agent of healing and transformation. This process of

transformation represents a binary relationship between ego-consciousness (one's normal waking state, or *little self*) and the Self (the totality of being), with waking consciousness forever expanding and moving toward completion through the integration of unconscious material – the as yet unrealized inner potential of the Self. Mandalas and other archetypal forms arise from the Self and serve as essential connecting links between the conscious ego and the unconscious, thus orchestrating and deepening this inner movement toward psychic wholeness.

In correlation with his own experience, Jung (1972) encouraged his patients to paint their own mandalas as part of the therapeutic process, and the works they produced were instrumental in helping him to procure a diagnosis of their personality disorders as well as their developmental inclinations and spiritual potentialities. This led him to the understanding that,

mandalas are important indicators of the process of personal growth that moves you toward fulfilling your particular identity and purpose in life. The mandalas we create indicate our premonition of a center of personality, a kind of central point within the psyche, to which everything is related, by which everything is arranged, and which is itself a source of energy. The energy of the central point is manifested in the almost irresistible compulsion and urge to become what one is, just as every organism is driven to assume the form that is characteristic of its nature, no matter what the circumstances (p. 73)

As Jung (1936/1958) would later discover, this notion of a central point to which everything is related is a key aspect of the Tibetan tantric tradition as well, and Jung's understanding of the mandala as a mythic symbol representing both healing and wholeness served to further his growing interest in Eastern spirituality and its complex symbolism, especially as found in the tradition of Tibetan Buddhism. This would contribute directly to Jung's (1959) seminal theory of the *archetypes of the collective unconscious* (i.e., universal mythic images that manifest worldwide throughout human history), with the mandala representing "the psychological expression of the totality of the self" (1972, p. 20).

Conclusion

For more than 1200 years, the mandala has served as a fundamental guiding force in the religious practice of Tibetan Buddhism, and has acted as both an instrument of spiritual development and a sanctified representation of enlightenment. In the twentieth century, the mandala would play a prominent role in the life and work of Carl Jung, for whom it served as both an agent of psychological healing and a numinous symbol of psychic wholeness. Jung's passionate interest in Tibetan Buddhism and other Asian spiritual disciplines would prove instrumental in the emergence of the East-West dialogue that over the past decades has sought to explore the intriguing intersection between modern Western psychology and ancient Eastern religious traditions (Clark 1994). These correlations have been especially well exemplified by the primordial image of the mandala, which in Jungian psychology, Tibetan Tantra, and countless other traditions has signified the *center*; the immeasurable and undivided totality in which all things ultimately arise and return.

Mantra

Fredrica R. Halligan

Mind Body Spirit Institute, Stamford, CT, USA

Many adherents of eastern religions, especially Buddhism and Hinduism, use brief verbal phrases or verses as objects for meditation. Such *mantras* are numerous, but best known are the *Avalokiteshvara mantra* of the Tibetan Buddhists, “*Om mani padme hum*,” and the *Gayatri Mantra* which is widespread among the Hindus:

Om Bhur Bhuva Svaha
Tat Savitur Varenyam
Bhargo Devasya
Deheemani
Dhi Yo Yonah Prachodayat

Any personally meaningful sacred word or phrase can be used as a *mantra* or as a focus for centering prayer. Well known among Christians is the “Jesus Prayer” described in *The Way of a Pilgrim*, a famous Hesychast text: “Lord Jesus Christ, have mercy on me, a sinner.” In Judaism, the simple word “*Shalom*” can be used repetitively as a *mantra*, or the *Shema Israel* can be said, affirming the unity and love of God. The comparable verse in Islam is called *Dhikr*.

Recent psychosomatic research (e.g., following Benson 1976) has shown *mantra* meditation to be very beneficial in eliciting the “Relaxation Response,” thus attenuating anxiety and improving physical (especially cardiac) health and pain reduction.

Māori Religion

Regina Pfeiffer

Religious Studies, Chaminade University,
Honolulu, HI, USA

An Intimate Relationship with the Natural World

In the Māori indigenous religious tradition of the islands of *Aotearoa*, commonly known as New Zealand, one of the more common cosmology narratives situated the beginning of the earth and sky in the darkness, Po, that dwelt between the primal parents, *Rangi* (Sky Father) and *Papa* (Earth Mother). Briefly, in one version retold by Elsdon Best (1924), the two parents clung tightly to one another as their progeny were brought forth in the darkness betwixt their bodies. The all-male

progeny, tiring of the cold and dank conditions, and seeing a glimmer of light, decided to separate their parents. *Tāne*, one of the seventy sons, persuaded several of his brothers to assist him in parting their parents. Using four poles held by four of the brothers who later become identified with the directional winds, the progeny struggled to separate the parents who clung even tighter. As a result, the sons were forced to sever the primal parents' arms in order to part them. For the Māori, the red ochre of the earth and the red glow in the sky came from the blood of the primal parents (Best 1924).

A more recent and briefer version in the text, *Māori Art and Culture*, described how each of the major progeny, *Tūmatauenga*, god of war, *Tangaroa* of the oceans, *Rangomātane* of raw foods and cultivated crops, and *Tawhirirangimātea* of the howling wind, all attempted to free themselves. However, it was *Tāne Mahuta* who successfully pushed and parted his parents (Awekotuku 1996, p. 26). This cosmology expresses a strong relationship with the natural world. Psychologically it implies a primordial struggle to emerge from the archaic darkness or unconsciousness or traditions. The sons who tire of the cold and dank depths see a light and struggle to separate from their parents, or be born into the light of consciousness, even severing their parents' arms, or their control. Thus, they gain names and become the first differentiated gods – war oceans, food, and wind. These most important powers are close to nature. War is a primeval aggressive instinct, ocean essential territory to master for island cultures, food of course basic to survival, and wind to master for sailing.

Atua: Gods

While many cosmogony stories did exist, many of them did not provide a detailed list of all the various gods known as *ātua* in Māori. The term *ātua* described gods in general and could be used to designate the different classes of Māori gods, ancestral, family, or malicious spirits. Best (1924) identified four classes of *ātua*. The highest class of gods had no physicality to them. Whether the

Māori did have a Supreme Being called *Io* prior to Western contact remains questionable, but, according to Best (1924), *Io* would be considered the highest of the Māori gods. Best (1924) described *Io* as the first class.

The second class could be identified as departmental, tutelary beings who also had no physicality to them. It was in this class that Best (1924) placed the gods of *Tāne*, *Tū*, *Rongo*, and *Tangaroa* their more common and abbreviated names. *Tāne* was considered the most important of the departmental gods within the Māori religious tradition because of his actions in freeing the primal parents. Among many of the attributes assigned to *Tāne*, a major one was that he was the originator of the forest and trees. The second of these gods *Tū* was the main war god whose name often was lengthened to provide further descriptive aspects of his actions and realm. *Rongo*, the third of these tutelary beings, was the god of cultivation, cultivated foods, and peace. The fourth one, *Tangaroa*, was associated with the ocean, including fish and other denizens. Yet, while these gods were similar in function and name with those of other Polynesian groups, the Māori had no major constructed sites or temples dedicated to the various *ātua*. Instead, the religious rituals were held in places that pertained to the activity of the particular god. For example, the battlefield would be the site of religious rituals and incantations dedicated to *Tū* (Best 1924; Moore 1995) (Fig. 1).

While the higher levels of gods had no physicality, the gods in the lower levels could have had visible forms or were associated with natural phenomenon. Rainbows, water, volcanoes, and lightning – all were manifestations of gods, but not the gods themselves. According to Best (1924), these lower-level gods were more active in human lives. As such, a particular relationship developed between humans and gods. “The feeling of the Māori is very marked in his mental attitude toward the stars and planets, which he greets in song and speech as old, old friends (Best 1924, p. 121). These lower-level gods often were appealed to for signs of good fortune, for protection, and for warnings of impending dangers (Best 1924).

Tapu

The fourth level included ancestral spirits. Perhaps one of the more well known of these lower-level gods is Maui. Maui's exploits included discovering the secret of fire, snaring the sun to slow its movement across the sky, and fishing the islands from the waters. This god Maui brings civilizing skills, like Prometheus in ancient Greece. Yet, these gods in the lower levels could be the source not only of good fortune and health but also of disease and death. Illness, misfortune, and death were attributed to two main causes, either an evil demon or spirit or the violation of some *tapu* that resulted in an offense against a god (Best 1924, p. 131). According to Ngahuia Te Awekotuku, "*Tapu* has many meanings, references and interpretations. It may be a descriptive or prescriptive condition, making an object, person or environment restricted and inaccessible to human contact, prohibited and out of bounds"

(Awekotuku 1996, p. 26). Jean Smith noted that *tapu* and the rules that governed it fell into various fields of practical concern, such as birth and death, status relations, and the preservation of property (Smith 1974, p. 6). Birth and death were examples of the passage between the ultrahuman and human worlds; hence, they were *tapu*. Awekotuku (1996) included these areas as *tapu* and added the body parts and ornaments of a chiefly person, incidental remains of their hair, and nail clippings (p. 27). Furthermore, "pollution of a man's *tapu* was an insult to his gods" (Smith 1974, p. 27). Persons themselves were *tapu* in the Māori tradition either by birth or by accomplishment. If by birth, then they were *tapu* because of their spiritual *mana*, sometimes translated as power, that resulted from their descent from the gods themselves. In the Māori tradition, the more direct one's descent from the gods, the greater one's *mana*, *tapu*, and rank (Smith 1974, p. 27). Albert Moore (1995) noted that *mana* was hereditary, coming from the ancestors and "manifested in the prestige of chiefs and orators," and that the *iwi* tribe, depended on it (p. 167). Moore (1995) added that *mana* could be both beneficent and dangerous; hence, *tapu*, sacred restrictions, was necessary to sustain and protect *mana*. However, when a *tapu* had been broken or a contamination of some form occurred, *tapu* removal was required (Smith 1974).

Memory Carvings

While some of these religious practices and beliefs, such as the four major tutelary gods, *tapu*, and *mana*, are similar to those of other Polynesian groups, what is distinctive about the Māori religion is the use of elaborate carvings to decorate the major gathering and assembly house, *whare whakairo*, located on the village *marae* or courtyard. Prior to European or Western contact, the houses were those of the chief of the *iwi*, the tribe, to which the people would gather at the *marae*, courtyard for social, political, and military concerns (Moore 1995). Adorning both the interior and exterior of the *whare whakairo* were elaborate carvings that often depicted some of the gods, ancestors, and their relationship with

human beings in a stylized manner. A. T. Hakiwai noted that the: “Māori world is a world of unity and coherence. People, the universe, stars, mountains, rivers, rocks and fish are all connected through genealogy, demonstrating the intimate relationship between Māori and the world around us” (Hakiwai 1996, p. 52). These carvings not only expressed this belief but also utilized the unique woods of the islands, *Aotearoa*, and included the red ochre coloring that harkens back to the separation of *Rangi* and *Papa*. Hence, the stories continue to live in the carvings and memories of the Māori people.

Another distinctive feature of the Māori religious tradition can be traced, perhaps, to the cosmogony story of the forceful separation of the primal parents. More warlike than any of the other Polynesian peoples, the Māori peoples were known for the *haka*, a chant. The motions, words, and tonal quality were meant to instill fear in the enemy and strength to the individual warriors who performed the *haka*. While some *haka* did greet guests, the more powerful forms of the chant prepared the individual for war. Psychologically, this strong aggressiveness seems to keep alive the fight to separate from the embrace of the parents (Fig. 2).

M

Sacred Land

Yet, when Europeans arrived in Aotearoa, the Māori struggled to maintain their religious and cultural identity. One major reason for this struggle was colonization and land development that separated the Māori from the land. In the Māori religion, the close connection between the people and the gods extended to the land as well. Some of the genealogical stories, particularly those of the *ariki* or chiefly line, linked directly to *Io*, the uncreated being (Cadigan 2001, p. 125). Furthermore, according to Tui Cadigan, “Through links to *Io* all things have *tapu*” (2001, p. 125). Thus, land as well as people was sacred. As a result, kinship was not only with the people both as a tribe and family but also with the gods and the land. According to Cadigan (2001), *whanaugatangata*, kinship, was about right

relationship “*ki te Atua*, (sic) (to the Supreme Being); *ki nga tangata*, (to people) and *ki te whenua*, (to the land). The word *whenua* means land and placenta” (Cadigan 2001, p. 125). As the European colonizers, called *Pakeha*, claimed more and more land ownership in the mid- to late 1800s, the Māori were displaced from their native land. For the Māori, Cadigan (2001) noted, selling the land was akin to selling one’s mother. Furthermore, “a landless Māori is literally a non person, there is no ‘place’ they belong” (Cadigan 2001, p. 126). Psychologically and spiritually, the Māori connect deeply with the land as their foundation of personal identity and as their source of life.

The sacredness of the land extended to the mountains of Ruapehu, Tongariro, and Ngauruhoe on the North Island in what is today Tongariro National Park. Mel White (2009) noted that the

Māori “look on all three volcanoes with awe and wonder and consider them *tapu*” (p. 82). This area at first was listed by the United Nations as World Heritage Site for its natural beauty. Later, in 1993, the national park was also granted the designation as a cultural site, the first natural site to receive such distinction, because a delegation that included Māori elders was able to persuade the UN committee to make that decision (White 2009). Even though the religion of the Māori no longer exists as it once did, the sacredness and importance of ancestors, family, and land remain an integral part of the identity and spirituality of the indigenous people of Aotearoa, the Māori.

María Lionza

Lee W. Bailey

Department of Philosophy and Religion, Ithaca College, Ithaca, NY, USA

La Reina Santa Maria de La Onza (The Queen Saint Mary of the Boar), María Lionza, is a goddess whose worship is very popular in Venezuela and nearby countries. Venezuela was colonized by Spain in 1522, when war and measles greatly weakened the Indigenous population. Slaves were imported from Africa, and relations among all the races over time bred a large class of *mestizos*, or mixed-bloods. Venezuela won independence from Spain in 1830, exported cocoa and coffee, then a major oil boom began after WWI. But society suffers from corruption, crime, and drug traffic (The truth; World Drug Report). Its state oil-producing company, PDVSA, has a US subsidiary named Citco. With a population of 29 million, Venezuela is ruled by descendants of the Spanish Conquistadors. The patriarchal tradition of South America’s Catholic Church tends to support the conservative men of the upper class, and political conflict long centered around the socialist President Hugo Chávez (1954–2013). The poverty rate is about 60%. The government is promoting social programs focusing on health, education, and poverty. The population now is about 68% Mestizo, 20% White, 10% African (Heckel, Lieuwen, Martz & McCoy), and 2% Indigenous Indians (International). This is the social background for María Lionza’s religion (Fig. 1).

There are two major symbolic mythic narratives about María Lionza’s origin. The first is common among the elite classes. It describes María as the daughter of a Spanish *hacienda* owner who was “crazy,” would run away naked, and be found talking to animals. Many among the Catholic elite scorn her “cult” as “black magic” where they sacrifice animals. This narrative places María as an offshoot of the upper class who rejected their social norms and expresses fear of her “cult” as crude and dangerous.

María Lionza, Fig. 1 Statue of María Lionza on the Francisco Fajardo Highway in Caracas. (Original as: Estatua de María Lionza en la autopista Francisco Fajardo). (This figure is licensed under the GNU Free Documentation License http://en.wikipedia.org/wiki/File:EstatuaMaria_lionza.jpg)

The second narrative of María Lionza's origin includes various accounts of her as a beautiful green- or blue-eyed daughter of an Indian chief of the sixteenth-century Yaracura region, struggling for survival against the Spanish Conquistadors (Varner 2009). Since Indigenous and African people typically have brown eyes, the image of María's blue or green eyes suggests that, if the daughter of an Indian chief, she was *mestizo*, probably meaning the chief seduced a white girl, which might anger the Spanish. In this version, she was sacrificed to or was grabbed by a deadly Anaconda snake in a lake. Snakes are highly symbolic of life/death/transformation/mystery. Aquatic Anacondas are some of the largest snakes in the world and crush their victims. María Lionza was resurrected as a goddess of nature, going through death and resurrection as many divinities

on earth do, showing their eternal nature as power over death. Or she exploded from inside the snake, showing her great power, and became the El Sorte mountain, where she is now worshiped as a nature spirit, who speaks through mediums and priestesses. Why the appeal? One author says:

Humans go for various reasons: to worship the spirits, in search of *amor, salud y dinero* (love, health, and money), to be cleansed, to talk with the spirits and ask them for advice, and in search of a general sense of well-being. (Placido 2001)

This version expresses strong Indigenous closeness to nature. Another myth tells of her as a native girl attempting to intercede with the conquering Spanish armies to save her people but was killed for her efforts. This expresses Indigenous feelings of resentment and betrayal. After death she came back to life as a boar (*onza*) – resurrection again – or as a woman riding a boar or tapir, as is portrayed in the daring statue in the middle of Caracas' highway, where she holds up a female pelvis, and people add wreaths.

María Lionza's devotees see their practice as an overlapping supplement to, not a replacement for Catholicism, which has baptized about 90% of the population. María Lionza tells her devotees that they must be baptized Catholics and practice a positive morality (Varner 2009, p. 37). In messages sent through mediums, an anthropologist reports that:

She uses a very learned language and says "Let us not make money into a god. It is possible to buy a cross, but not salvation. Do not make promiscuity a god." . . . their practices are about beauty and purity, about order and morality, about becoming clean and behaving properly. It is of this pureness and morality that the spirits speak. . . . Spirits tell married couples to stay together, young girls not to have sex before they get married, young boys not to fool around Requests or attempts to act against the teaching of the Catholic Church and of mainstream morality are judged very negatively by both mediums and believers. (Placido 2001)

Her believers commonly go to church then go pray at María Lionza's altars with her statue. It is a syncretic blend of Catholic beliefs, such as her name María and candles, and African traditions, such as drumming and healing, and Indigenous practices, such as cigars and spirit possession.

María Lionza is a living, energetic syncretic goddess with a large following and a powerful psychological gift to give her people. It is not a quiet, reserved religion, but is a dramatic synthetic image emerged from the collective unconscious of Venezuelan history and society.

Most of María Lionza's devotees are people of the large poor class, although all kinds of people come to her ceremonies. On October 12, many celebrate "Columbus Day," renamed *Día de la Raza* (Day of the [meeting of the] Races). But the masses of poor, who live in sprawling, crowded, violent *ranchos* (shantytowns) like "Little Hell," celebrate "The Day of Indigenous Resistance." This is part of the reason for the popularity of María Lionza. She attracts large numbers of devotees, many who feel helpless, victimized, and oppressed. These feelings can lead to passive despair or angry violence. But many find strength in María Lionza's psychological and spiritual healing. Her celebrations can be a wild, anarchic, exotic carnival of wonders.

They come to María Lionza with great collective wounds, inner and outer. For example, in one widely publicized case, Linda Loaiza López, at age 18, in 2001, on her way to register for college in Caracas, was kidnapped and kept by an upper-class man for 3 months as a sex slave, repeatedly raped and tortured. Finally, the police rescued her. Her ears were destroyed, eyes and teeth damaged, and more. Hospital photos were widely published in Venezuela, arousing outrage. The trial was delayed for 3 years, judges refusing to take the highly charged case. Finally, her torturer, whose father was a high-level politician, was acquitted on the unproven assertion that she was a prostitute (Nichols 2006, pp. 74–75). Linda spent over 580 days in the hospital. An appeal trial in an international court began in 2005, after which her attacker was convicted and spent 6 years in jail. Linda pursued a Master's Degree in International Law and "regained her smile" (Guerrero 2011; Ross 2005). The case was widely seen as a symbol of cruel oppression of women, even among elite women. This is an example of why, as Nichols says: "the native cult of the indigenous goddess María Lionza, which offers an accepted

avenue for women's public voice, has continued to grow" (Nichols 2006, p. 76). As a goddess, she offers to women who identify with her a feminine healing path to the divine. She is like a wild sister of Mexico's Our Lady of Guadalupe but both Virgin and passionate Fertility Goddess.

Although the elite class in Venezuela sees María Lionza's religion as a threatening "cult," neutral religion scholars describe religions through the phenomenological method of "bracketing" judgment about the truth or value of a religion. There are no reports of negative "cultish" behavior, in the sense of deception or captivity. But while María Lionza is said to stress a positive morality, as a noninstitutional religion, there is little control over who practices it. Consequently, there is a wide range of believers, as with any religion. Some stress proper morality and not rebellion. Others emphasize Indigenous values. At the other extreme, some "holy thugs" believe in her with a Robin Hood kind of morality (Getzels 2010). Some scholars do not condemn them (Nichols 2006). María Lionza's religion is now legal and practiced on the *Cerro* (Mountain) *de María Lionza* National Monument.

In Caracas a magnificent statue of María riding the boar, bare-breasted (symbolizing nurturing and daring) and holding up a human pelvic bone (symbolizing female birth-giving), was erected in 1951, rising 23 ft. on the median of the Francisco Fajardo main thoroughfare. It is the inverse of the traditional public statue of a macho military hero riding a horse, phallic sword aloft. It is a bold symbol of the power of the archetypal feminine strength of a new religion that gives her devotees emotional strength and self-esteem amidst social harshness (Nichols 2006, p. 79). The pelvic bone that María holds up high in public uplifts feminine strength. The writer Yolanda Pantin urges María's devotees to "Believe, believe in something/that is not corruption" (Pantin 2002, p. 15), and "Hail the queen/Who remains in the waters/I pronounce this prayer/Before your statue" (Nichols 2006, p. 99).

To those who call themselves *marialionceros* (those who practice the María Lionza's religion), she is the central divinity in a trinity including the

Indian Chief Guaicaipuro and the black slave el Negro Felipe, both victims of colonial wars. They are leaders of a number of changing “courts” that lead rituals, such as the Indians, the Medicals, the Juans, the Teachers, the Africans, the Saints, the Criminals, and the Revolutionaries (Nichols 2006, p. 78).

María of the Boar represents the divine protection of women, nature, and oppressed peoples who feel helpless. They go to her ceremonies and pray to her for strength. Nichols says: “It is evident that María Lionza represents a protective figure for society’s underdogs, women, the native peoples, persons of African descent, the poor, and the disenfranchised” (Nichols 2006, p. 80). Songs, poetry, and TV films celebrating her and her priestesses (*santera*) have been popular (Nichols 2006, p. 94).

María Lionza’s religion gives women the opportunity to be priestesses. Mediums (*material*) of the spirit world arise spontaneously, and the priestesses (*bancos*) translate and interpret for the mediums. By becoming María’s *bancos*: “the marginality of women from political power is overcome,” says Gustavo Martin, and “through a holy path, woman is elevated to power and all the masculine spirits that appear in the cult are subordinate to her” (Nichols 2006, p. 95). The ritual dance and trance possessions “are true acts of catharsis through which individuals let loose their repressions” (Nichols 2006, p. 96). Women especially shed their passivity and anxiety and regain strength (*fuerza*) to endure or overcome suffering. The pained ego-consciousness of these believers is drawn closer to their archetypal Self, where the wounded ego is strengthened. Nichols says:

The figure of María Lionza not only legitimizes the position of women as powerful beings to be respected, but also opens up the possibilities for women’s representation beyond the traditionally assumed archetypal trinity of Virgin, Whore, and Nun. (Nichols 2006, p. 98)

Mediums say things such as: “I am Yara, from the sky/heaven of the Venezuelan aboriginal Indians. But María, this beautiful Hebrew name, forms part of my true identity.” She blends fierce indigenous natural power and Christian

spirituality. “María Lionza insists that her followers practice mainstream morality, benevolence and kindness, not anger” (Nichols 2006, p. 97). As a Goddess, María Lionza offers spiritual power, such as the “gift” of being a medium, as a “Queen” she offers worldly power, and as a “Mother,” reproductive power and protection (Nichols 2006, pp. 97–98).

Thousands of pilgrims gather at El Sorte mountain on “The Day of Indigenous Resistance” to participate in the indwelling spirit of María Lionza. The air is full of smoke from fires and cigars, the sound of many devotees pounding loud drums, and gunpowder exploding in the open fires – the collective unconscious fires up! The excitement begins with the dramatic rituals of the many “courts,” priestesses, priests mediums, and the *Velaciones* (theatrical healing rituals). Cigar smoke is blown around to guide helpful spirits and keep away evil spirits. Perfume and rum are in the air. Some go into trances, trembling with glazed eyes and boldly slice their tongues with razors, so that blood flows down their chests, while the onlookers shout “*fuerza!*” Women bring babies to them to be kissed with the mark of blood. At night fires flame high, devotees jump through the flames and walk over the red-hot coals (Cahana). The sounds of one shouted word echo: “*fuerza,*” (strength), a plea to María Lionza for *strength* to overcome the oppression they feel.

Numerous rituals of healing are organized by priestesses and priests, where those seeking healing of all kinds lie down, are surrounded with lines of chalk powder, wine, fruit, and candles. Mediums speak the words of deceased ancestors and spirits to advise and comfort the crowd. The next day many sit meditatively, recovering in the cool waters of the Yaracuy River, reflecting on the intense rituals where they have felt María Lionza’s *fuerza!*

Marriage

Kelvin F. Mutter
 McMaster Divinity College, Hamilton, ON,
 Canada

Marriage is a culturally constructed institution that describes a formal union between two or more individuals which is delimited by the explicit and implicit commitments of each partner as well as personal, religious, and cultural expectations. Traditional and contemporary forms of marriage vary greatly and reflect historical and emergent sociocultural values. In most cultures historical marriage patterns suggest a preference toward the practice of endogamy.

Religious Views

Religious constructions of marriage reflect a group's interpretation of their holy texts (e.g., the Qur'an, Torah, Vedas, or Bible), religious tradition (e.g., the Talmud, the Hadith, or theology), culture, and contemporary thought. These perspectives shape an individual's understanding of marriage and marital wellness. For example, Islam views marriage as a heterosexual relationship that is half of a person's religion, foundational to the family and society, the legitimate context for sexual activity and procreation, and traditionally complementarian in its structure

(Al-Krenawi and Graham 2005; Onedera 2008). Within traditional Hinduism, marriage reflects an agreement between families rather than individuals and is a sacred joining of a man and a woman that serves the goals of fulfilling religious duty, procreation, pleasure, and emotional support (Onedera 2008). Judaism has traditionally viewed marriage as a lifelong heterosexual relationship that serves the purposes of providing companionship, procreation, and educating children in the Jewish tradition (Onedera 2008).

Catholics and conservative Protestants define marriage in terms of it being a sacrament or covenant, a lifelong commitment, and a heterosexual relationship in which there is love, sexual faithfulness, and an openness to children (Onedera 2008). Although liberal Protestants hold many of the values that shape Catholic and conservative Protestant marriage, some have argued that the norm is not heterosexual marriage but rather an egalitarian partnership that is inclusive of heterosexual and same-sex relationships (Onedera 2008; Thatcher 1999).

Lastly, religious views on marriage develop as a couple or religious community interacts with and incorporates values drawn from the culture (Al-Krenawi and Graham 2005; Hiebert 2013). Some cultural values which are currently present within contemporary Western Christian views of marriage include self-selection, connectedness, familism, need fulfillment, romantic love, emotional closeness and wellbeing, sexual intimacy, and harmony (Hiebert 2013).

Religious Incorporation of Psychological Insight

Psychological constructions of marriage draw from cognitive-behavioral, developmental, experiential, psychodynamic, and systemic theories (Gottman 1999; Johnson 1996; Nichols 1988; Willi 1977). Mutter's (2013) review of the pastoral and Christian marital therapy literature from 1950 to 2011 documents how Christian writers incorporated contemporary psychological views on marriage within their counseling models. The limited body of literature related to the integration

of non-Christian religious perspectives on marriage with the practice of marital therapy makes it difficult to trace the relationship between these traditions and Western psychology.

Gurman and Fraenkel's (2002) review of the literature from 1930 to 2002 traces the history of the marital therapy movement through four phases (atheoretical marriage counseling, psychoanalytic experimentation, family therapy incorporation, and refinement, extension, diversification, and integration). These "phases" are not discrete periods with a firm beginning and end. Instead, these phases are characterized by the emergence of new emphases which persist both in practice and within the literature.

The first phase in the development of marital therapy, atheoretical marriage counseling (c. 1930–1963), focused on pre- and postnuptial counseling of couples and marriage education (Gurman and Fraenkel 2002). These emphases are evident in historic and current pastoral practice, especially by ministry generalists who lack extensive training in counseling theory and practice (Mutter 2013). Although the views and practices characteristic of this phase lack a psychologically informed theory to guide practice, religiously devout individuals possess a theory of marriage that is derived from the practical wisdom of their tradition.

In the second stage of development, psychoanalytic experimentation (c. 1931–1966), marriage counselors looked to the psychoanalytic tradition to provide insights into the couple relationship and to guide their practice (Gurman and Fraenkel 2002; Willi 1977). The insights provided by psychodynamic theory include being aware of how each partner's personal history influences their expectations of self and other, their motivations, and their behaviors. A second contribution of psychodynamic theory is seen in the linking of marital difficulties to one or both spouse's unresolved conflicts and needs. The use of psychodynamic theory to inform practice may be observed within some pastoral and Christian approaches to marital counseling (Mutter 2013). In addition, the application of psychodynamic theory to marriage may be observed within some pastoral care texts and some Christian self-help books.

The third stage of development, family therapy incorporation (c. 1963–1985), reveals a shift from focusing on the intrapsychic to focusing on the interpersonal as counselors drew on concepts and methods derived from family systems theory (Gurman and Fraenkel 2002). This perspective introduced marital counselors and therapists to the idea that relational systems function according to explicit and implicit rules, that each member of a relational system has a role to play within that system, and that patterns of interaction may contribute to either the health or dysfunction of the system. The incorporation of concepts drawn from family systems theory is evident in both the pastoral and Christian marital counseling traditions (Clinebell and Clinebell 1970; Worthington 1989). The influence of family systems thinking is also seen in self-help books such as those that highlight the role of maintaining healthy boundaries within marriage and the influence of a person's family of origin on the way they relate to their spouse or family.

Beginning in the mid-1980s, the field of marriage counseling underwent further developments: i.e., refinement, extension, diversification, and integration (Gurman and Fraenkel 2002). Three approaches illustrate the conceptual and technical refinement of marital therapy: Behavioral Marital Therapy (Gottman 1999); Emotionally Focused Couples Therapy (Johnson 1996); and Insight-Oriented Marital Therapy (Snyder 1999). These models are characterized by refinements in theory (i.e., of intimate relationships, marriage, counseling) and a growing body of research that both shapes these refinements and supports the use of these models. The influence of these marital counseling approaches is evident in pastoral and Christian marriage counseling practices (Mutter 2013), as well as some of the marital self-help literature published by the religious press.

The extension of the field of marriage counseling is evident, for example, in its use as a mode of treatment for psychiatric concerns (Blow et al. 2015; Pukay-Martin et al. 2016). Similarly, marital counseling theory and research informs the new generation of programs designed to prepare couples for marriage, enrich existing

marriages, or prevent divorce (Gurman and Fraenkel 2002; Mutter 2013). Not only do these marriage preparation and marriage enrichment programs resonate with the concerns of clergy but research reveals positive effects when these programs are used by clergy.

The process of diversification refers to the use of perspectives other than psychology to broaden and/or critique the clinician's understanding of marriage and work with couples: e.g., feminism, ethnicity and culture, and postmodernism (Gurman and Fraenkel 2002). While pastoral and Christian writers acknowledge the challenges posed by intimate partner violence and culture, many of these discussions tend to be descriptive rather than a critical examination of how beliefs about gender shape the counseling encounter. Similarly, while the pastoral and Christian counseling literature related to intercultural counseling acknowledges the role of culture in shaping marriage, pastoral and Christian marital therapy texts do not reflect on the roles of race and ethnicity in counseling practice. This highlights a need for a critical examination of any cultural, racial, class-bound, and/or national assumptions that may be present within the faith-informed counseling and self-help literature. Lastly, the practice of diversification is implicit in the ethical use of couple therapy with religious couples as this requires an awareness of the couple's spiritual values, the practitioner being self-aware of their own spiritual values and biases, and an awareness of how these values and biases shape the therapeutic process.

"Integration" occurs when a model of couple therapy integrates or combines methods and modalities derived from two or more theoretical perspectives or from a counseling model which is not explicitly systemic in its orientation, e.g., the integration of object relations therapy within a short-term framework (Donovan 2003), and the use of REBT with Jewish, Christian, and Muslim couples (Johnson 2013). Worthington's *Hope-Focused Marriage Counseling* (2005) is an example of an approach written for use by Christian clergy that integrates multiple perspectives within a single counseling model.

Marriage Research

Prior to the late twentieth century, all forms of marital therapy, including the practices of religious counselors, were underresearched (Gurman and Fraenkel 2002; Mutter 2013). Since that time there has been an increasing body of research focusing on a variety of topics such as the value of conjoint couple therapy, the process of couple formation, divorce prevention, the validation of specific counseling methods and models, etc. (Gurman and Fraenkel 2002). Increased research activity is also evident within the pastoral and Christian marriage counseling community which has studied the role of religiosity in marital therapy, forgiveness-oriented therapy, marriage education and enrichment programs, marital intimacy, and a variety of marital stressors (Mutter 2013). Outside of the Christian community, there is an emerging body of research by Muslim scholars on topics relating to marriage, marriage practices, and marital counseling. Lastly, the subject of intermarriage is a topic of research interest for many religious communities both in terms of the processes contributing to exogamy and its effect on family processes, including but not limited to family faith practices.

Martín-Baró, Ignacio

Daniel J. Gaztambide
Union Theological Seminary Program in
Psychiatry and Religion, New York, NY, USA

Ignacio Martín-Baró (1942–1989) was a Jesuit priest, philosopher, and social psychologist who is most recognized for using the theological-ethical-political insights of liberation theology to

develop a social justice-oriented liberation psychology. Drawing on insights from liberation theology, Paulo Freire's pedagogy of the oppressed, critical/political psychology, and social psychology, Martín-Baró conducted research projects with a "preferential option for the poor" and oppressed people of El Salvador, with the intention of raising awareness and empowering them in the midst of social, political, and war-related trauma. Due to his political positions and socially progressive psychological research, he was murdered by the Salvadoran army along with five other Jesuits and two employees at the Central American University in El Salvador.

Ignacio "Nacho" Martín-Baró was born on November 7, 1942, in the municipality of Valladolid, Spain. He became a novice of the Society of Jesus in 1959 and was transferred first to Villagarcía and then to Santa Tecla in El Salvador for his second year. From 1961 to 1965 he was sent to study at the Catholic University of Quito (Ecuador) and later to the Javeriana University in Bogotá, earning a bachelor's degree in philosophy and a licentiate in philosophy and literature. He returned to El Salvador in 1966 to teach at the *Externado* San José and in 1967 also began teaching philosophy and theology at the *Universidad Centroamericana "José Simeón Cañas"* (UCA or Central American University) in San Salvador, the capital. This was short lived, as Martín-Baró left that very year for Frankfurt and then Leuven to study theology. He returned once again to El Salvador in 1970 to finish his last year of theology, due to encouragement from his close friend, the liberation theologian Ignacio Ellacuría. Due to a prior interest he developed in Bogotá, whereby he consumed a variety of writings from psychology, Martín-Baró began studies in the field at UCA. He earned a licentiate in psychology in 1975, during which time he was also teaching the subject in the National Nursing Academy of Santa Ana. Desiring to expand his knowledge of psychology, he earned a master's degree in social sciences and a doctorate in social and organizational psychology from Chicago University from 1977 through 1979. Although he was in the United States during this time, both his master's and doctoral theses showed a deep concern with the growing social

and political turmoil of El Salvador, as he wrote about group conflict and the living conditions of the lower classes in the Central American country. Although deeply involved in his studies, he was attentive to the latest news from El Salvador.

After completing his studies in the United States, he returned to El Salvador to become a lecturer and head of the psychology department at the UCA. From 1981 through 1989 he acquired numerous administrative and academic positions within the university as well as became member of the editorial board of numerous social science journals, such as *Estudios Centroamericanos* (Central American Studies) and the *Journal of Salvadoran Psychology*. Apart from these endeavors as a scholar, Martín-Baró in his capacity as a priest first served in the district of Zacamil, which lacked a clergyperson in the early 1980s, and afterwards performed sacramental duties in the parish of Jayaque, a poor rural municipality some 30 km from San Salvador. It was in this role that he appeared closest to the Salvadoran people, involving himself through pastoral and community care and helping construct necessary structures to improve their living conditions (such as a new bridge, or providing wood and materials to fix their homes, etc.).

As a result of his studies in liberation theology and social psychology, of Paulo Freire's pedagogy of the oppressed, political/critical psychology, as well as his experiences as a Jesuit in El Salvador before and during the Salvadoran Civil War (1980–1992), Martín-Baró developed a system of psychological thought he termed "liberation psychology." In developing liberation psychology, he critiqued the general state of Latin American psychology for its "slavery" and "scientific mimicry" – the uncritical importation of North American psychologies for the purposes of gaining prestige and power, as ideologies alien to the experiences of the Latin American people, with its attending positivism, individualism, hedonism, and ahistoricism. He argued that such imported constructs tended to problematize the experiences of the common and poor people of El Salvador while ignoring structural injustice and thus serving the interests of the ruling classes. In the stead of imported psychology, he proposed a

liberation psychology based on three guiding principles of liberation theology: a Christian God of life who scorns injustice, the primacy of orthopraxis over orthodoxy, and the preferential option for the poor. Based on these ethical and philosophical commitments, Martín-Baró argued that psychology should ally itself with the oppressed people of El Salvador and develop research projects that would help articulate and give voice to their experiences, fostering the development of a critical consciousness (*concientización*) of their personal, social, and political conditions. This liberatory aim would be accomplished by psychology working not for but with the Salvadoran people and their cultural and religious values, recovering their historical memory as people and as communities surviving in limit situations, and by subverting the dominant narratives of the powerful and allowing people to experience their reality in more critical and liberatory ways, giving them the tools necessary for psychological and collective liberation. One particularly important application of this theoretical lens was in the development of the University Institute for Public Opinion in 1986, which Martín-Baró (as the only doctorate level psychologist in the country at the time) used to study popular opinions about the war, the US government's involvement, and the Salvadoran government itself. He in turn reflected these opinions back to the common people in order to inspire discourse, reflection, and critical consciousness.

Because of this liberation psychology, its political ramifications, and the research projects undertaken through this lens, Martín-Baró's life became threatened by the dominant conservative political forces of El Salvador. In order to protect his colleagues and allies at the UCA and himself, he made numerous trips outside the country, especially to the United States, to have intellectual exchanges with colleagues in social psychology and increase the visibility of the work being done in El Salvador. Such academic rapport led to his group and some North American colleagues extending his public opinion research more broadly to Central America, through the establishment of the Central American Program of Public Opinion in 1988.

Tragically, on the evening of November 16, 1989, Ignacio Martín-Baró was killed along with five other priests and two employees on the UCA campus by US-trained Salvadoran troops. It is reported that he spoke out against injustice to the very end. His last words, spoken over the gunfire directed at his close friend Ignacio Ellacuría, were "Esto es una injusticia!" meaning "This is an injustice!"

Commentary

George Atwood and Robert Stolorow in their classic text *Faces in a Cloud* argued that all psychological theories are the product (at least in part) of the intricate and idiosyncratic cultural, historical, and subjective experiences of the theorist. Their intersubjective systems approach would contextualize all psychological theories, then, within the respective lives of their theorists. Such an approach to the study of psychological theory would be undertaken not as an attempt to invalidate the theory but to comprehend the theorist's intent and vision.

Atwood and Stolorow studied various metapsychologies which claimed different universal forces motivated human behavior (Freud's drives, Jung's archetypes, Reich's bioorganic energy, and Rank's notion of the will) but in the end revealed the deep texture of the metapsychologist's subjectivity. This subjectivity with its particular personal-social-historical location, it appeared, was in many ways forgotten (was unconscious) in the construction of theory.

In Martín-Baró's construction of liberation psychology, one does not find decontextualized meta-constructs which claim universal validity and influence on human behavior (something he himself criticized of much North American psychology), but rather a set of assertions and theories developed out of his experiences as a Jesuit priest working with the Salvadoran people in the years before and during the Salvadoran Civil War. In his writings and work, he himself contextualized his theories as the product of political, historical, and personal circumstances, developing research that unapologetically made

a preferential option for the poor and displaced people of El Salvador. He made repeated conscious efforts to construct a psychology that validated the experiences of the Salvadoran people, allowing them to give voice to socially and psychologically repressed emotions and opinions. Liberatory psychological theories were to be crafted not as abstract universal principles developed in order to safeguard a subjectivity that craves recognition and social status but by immersing one's subjectivity as a researcher in solidarity in the subjectivity of the oppressed. In Martín-Baró's case the oppressed were not abstract political entities but the particular people suffering under oppressive regimes in El Salvador and Latin America.

Encounters with the Salvadoran people in a religious and rural context and with liberation theology and with liberation theologians such as Ignacio Ellacuría were of crucial import to Martín-Baró's development both as a Jesuit priest and as a social psychologist. Although he was born and raised in Spain, liberation theology's God of the oppressed with its preferential option for the poor can be seen as having fomented in him an identification with the people of El Salvador. Alternatively, it could be argued that his empathy and experiences with the Salvadoran people in a condition of sociopolitical oppression made him more attracted to the discourse of liberation theology. From the perspective of relational psychoanalytic research on God-images, the former case could be understood as the image of a God of justice and the oppressed affecting the transference-countertransference relationship between Martín-Baró and his parishioners in El Salvador, while the latter suggestion could be understood as that same transference relationship affecting his image of God. Intersubjectively speaking, both dynamics could have been present, his experiences among the poor affecting his theology and his theology affecting his experiences among the poor. Martín-Baró's patterns of relating himself with his environment, his experiences, and his theology can be seen as deeply affecting his liberation psychology in an especially self-conscious way.

Mary

Regina A. Fredrickson
Blanton-Peale Institute, New York, NY, USA

Mary, maiden of Nazareth, Mother of God, pre-eminent follower of Jesus, has seized the personal and communal religious imagination of believers. Down the ages and across cultures, Mary has been

heralded in painting, poetry, prayer, and pagentry. Most often the intuitive psychology of personal and communal sentiments predates the theological articulation or liturgical celebration of Mary as virgin, mother, and companion.

Whether masterpiece or indigenous work, Mary's person is inextricably bound to her assent to her role in the Incarnation-Redemption and by appropriation to her foremost place within the Church, and within the pilgriming people of God. She is the attentive, inclined young woman whispering a thunderous *Fiat mihi* (Luke 1.38). She is the rounded, redolent Madonna gazing, swaddling, and nurturing her Son (Luke 2.7). She is the restrained, resplendent Hodigitria icon beckoning and presenting her regaled Emmanuel Child (Matthew 1.11). She is the wise woman crone surrounded by prophets and populace, penitents and patrons pictured in catacomb Orans etchings, sketched Coptic depictions, or embellished Renaissance family commissioned works.

The people of the early waves of evangelization were steeped in the mythology and archetypes of the goddess trilogy of maiden, mother, and crone. Agricultural peoples felt the power of the fecund, nourishing and sometimes punishing Great Mother, while others were comfortable with images of the mother-son, queen consort-ruler representations. Vestal rituals and festivals abounded. Paul preached amid Diana's temples. From a psychological developmental lens, the maiden becomes mother then evolving to the wise and companioning crone. Within faithful and orthodox tradition and theology, Mary was never deemed a goddess, yet there were epochs of popular excess, political contrivances, misguided homage, and stark purgings.

Mary: Maternal Theotokos

British pediatrician and psychoanalyst, D. W. Winnicott, wrote of the intensity and perduring influence of the mother's early "primary maternal occupation" [with her child]. His works convey the ongoing function of the mother's presence, her ordinary ministrations, and her facilitation of the

integration of her child's psyche, soma, and mental development (Winnicott 1992, Chap. XXIV). Both psychological constructs are applicable to the centrality of Mary's motherhood as theologically defined in the patristic church. Her singular relationship to her Son, who was both the Logos and *Verbum* of God, and her evolving presence within the soma of the church were hailed at the Council of Ephesus in CE 431. Mariology followed Christology and Mary was decidedly declared Mother of God, Theotokos, and God-bearer. This proclamation affirmed that Christ was one divine Person, with both a divine and human nature. The emphasis of the council was to refute the several variations of heresy concerning the Person and nature(s) of Jesus. Mary was deemed mother of the fully human incarnate, second creation, and nature of the one Person. The response of the people further enunciated Mary as Mother of God.

The psychological literature is replete with references to the essentiality of the mother. The love relationship between the mother and son was seminal in Freudian thinking. For child analyst, Margaret Mahler, the mother's capacity of attentive empathy made her "a beacon of orientation [for the child] in the world of reality" (Bacal and Newman 1990). The pastor and psychoanalyst Harry Guntrip, writer of the mother-infant dyad, asserted that "the deepest thing in human nature is 'togetherness.' After passing through separation at birth to 'aloneness' . . . there still persists that oneness of the child with the mother . . . It remains as the secret foundation of the stillness, security and peace of the Brughes Madonna . . ." (1992, p. 269).

Scarce are the Scriptural accounts of Mary's lived and shared experiences. Yet, what is recorded of her is analogous to the motherhood constellation posited by Daniel Stern, infant researcher and psychoanalyst. For the new mother, there is the life growth concern for the physical and psychological well-being of her child. There is the oscillating questioning of her capacity for "primary relatedness" and her efforts to secure the ties of attachment, security, cohesion, and affection. The synoptic Gospel accounts of the Incarnation, the infancy, and early hidden

life of Jesus suggest that Mary's relational self was analogous to that of other mothers. She exhibited the normal tensions between her hopes and expectations and her fears and premonitions keeping all these things in her heart.

Stern continues in his delineation of this motherhood constellation affirming that the mother herself demands a "supportive matrix" and that she undergoes an "identity reorganization" as she evolves over time. The pericopes of Jesus' ministry and the subsequent Pentecost event reveal Mary's evolving communal self and the consequent demands for her psychological reorganization from virgin, mother, and preeminent companion to the followers of Jesus.

The mother-child dyad is a continuous flowing of mutual-reciprocal influencing, and while the externals of the early and deep maternal musings and preoccupations may dissipate, they are subject to reactivation over the mother's lifespan. Within the child, these early and intense emotional and neurological working models of the mother's presence, containment, and soothing can be elicited again as the "evoked companion" (Stern 1995, pp. 171–185). Through the centuries, such had been the reactivation of Mary's natural protection and the pilgrim peoples' eliciting of her evoked presence.

Mary: Strong Maiden

Were we to visualize the maternity of Mary as a triphytic with its two covering panels, the first panel would depict Mary as a daughter of Abraham and virgin of Nazareth. This historical Mary and her choice of virginity is indeed a paradox, personally, religiously, and culturally. Mary lived in a multicultural milieu, a multi-governed political regime, and a marginalized position of poverty, gender, and religion. From another perspective, she was deeply knowledgeable and rooted in the Messianic prophecies and their reference to the virgin (Genesis 3.15 and Isaiah 7.14). Living near trade routes, hearing many languages, and coping with competing cultural values, Mary could not be naive or complacent about her volitional virginity. This virginity

grounded her personal sense of self as a singular "at-oneness" yet positioned her communal self with respect to her people and her God. Upon her visit to Elizabeth, her kinswoman (Luke 1. 46–58), Mary proclaims her integral fullness and magnifies and rejoices in her God. She aligns herself intergenerationally and affectively to our father Abraham and his descendants. She resonates with a fundamental option for the poor and oppressed. She acknowledges that her grace-filled person will be called blessed through the generations.

Reflecting on the poet William Wordsworth's words, she was indeed "... our tainted nature's solitary boast" (Wordsworth 1977). Her call to this virginity went beyond physical intactness and integrity to that of psychological attentiveness and attunement. It was a transformative source of personal cohesion and spiritual unity culminating in both virginal sufficiency and maternal abundance. Her stance of introspection and interiority moved outward in Mary's embrace of the virgin-mother paradox and encircled ever-widening communities.

Mary: Companion in Our Pilgrimage

The second panel covering the maternity triphytic would elaborate Mary's position within the ever-widening communities of the followers of Jesus. The wise woman, crone, holds the traditions and companions the pilgrim people. Psychologically and developmentally, she is a grounded, seasoned, and tested woman abounding in lived and shared experiences, relieved of individual family responsibilities and available for those generative and integrative functions in the larger community. From the Pentecost event emerge two Marian considerations. She was among the disciples who "were constantly devoting themselves to prayer, together with certain women, including Mary, the mother of Jesus" (Acts 1. 14). She is both locus and encounter for the new community of Jesus' followers, and again, she receives the fullness of the Holy Spirit. She is commissioned to minister among the diverse peoples "from every nation ... [who] at the sound [of the rush

of violent wind] gathered and were bewildered, because each one heard them [the disciples] speaking in the native language of each" (Acts 2. 5). The Pentecost paradigm is the nodal psychological and life cycle event that thrusts Mary into her relational and communal vocation of companion to the journeying people of God.

Jaroslav Pelikan, eminent historian and scholar in the humanities, in his exhaustive and artistic volume on Mary's place in culture, proposes that the Maryam of the Qur'an and the Miriam of Zion may function "as a bridge builder to other traditions, other cultures and other religions" (1996, p. 67). In the Christmas greeting (2007), "A Common Word," addressed to the Christian communities, leading Muslim teachers opened their letter quoting from the Chapter of Mary. The metaphor of Mary, as the bridge builder, and its psychological implications are not lost in considering her most documented apparitions. While assent is not incumbent, these apparitions show a predilection for the poor and unlearned, the young, and the indigenous peoples as seen at Lourdes, Fatima, and Tepeyac (Guadalupe).

The merciful and powerful queen, advocate, and refuge theme runs deep in the religious psyche. Personal and communal blessings, victories, rescues, and restorations have been attributed to Mary's presence and patronage. While miracles and apparitions do not require belief among Roman Catholics, the Church has declared two dogmas for ecclesial assent concerning Mary, namely, the Immaculate Conception (1854) and the Assumption into heaven (1950). The first defines Mary as free from any or all sin from the first moment of her conception and throughout her life. This singly graced position distinguished her and was prescient and orienting for her role in the Incarnation. The second definition, that of the Assumption, follows the long tradition in both the Eastern and Western churches of Mary's dormition, of her incorruptible body and soul being taken up into the glory of her Son and the fittingness of her hailed position relative to her Son's glory. Neither declarations supported Carl G. Jung's attempts to feminize the Triune Godhead as depicted in the quaternity image of the feminine

and the goddess within the Trinity. Both declarations bring to prominence the integrative wholeness of body and spirit, but they have limited accessibility and intensity for the religious imagination of other communities.

Righting this tendency to imbalance in Marian devotion and theology, the Second Vatican Council (1966) in the decree *Lumen Gentium*, the Dogmatic Constitution on the Church, situates the statements on Mary within the schema dealing with the total community of the Church, with her living as a "pilgrim of faith" (no. 58) and being "one with all human beings" (no. 53). In Chapter VIII of the document, the council fathers renew the concept of Mary as model of the Church, citing her obedience, faith, hope, burning charity, and perfect union with Christ (nos. 61 and 63). Such virtues together with her solidarity with the poor, her strength in faith and response to grace, and her call to ongoing justice ministry speak to a wider ecumenical fellowship and are vital to dialog with the present culture. Such virtues appeal to the broader human community, address the ruptures of the human condition and culture, and resonate with acts of global concern, conscience, and care.

Our psychological and religious sensibilities about Mary's companioning function strain between the beautiful enthroned woman ushering Dante in the final steps to *Paradiso* to the graphic and palpable image of Mary the single, unwed mother whose son will be executed, an image offered in Pax Christi reflections. Theologian Elizabeth Johnson gives us a creative and thoughtful biblical paradigm in which Mary is partner and companion, comrade and co-disciple (2003, p. 313). The historical virgin of Nazareth, the theological maternal Theotokos, and the psychologically evoked companion crone ever enfold in our personal and communal imagination.

Mary Magdalene

Kathryn Madden
National Institute for the Psychotherapies,
New York, NY, USA

The figure of Mary Magdalene depicted in the New Testament of the Christian tradition was the first witness to the resurrection of Jesus Christ. Specific New Testament references to Mary Magdalene include the Gospel of Luke 8:2–3 in which Mary Magdalene is described as one who ministered to Jesus. This passage also describes an exorcism of demons, which, according to current biblical scholarship, may not refer definitely to Magdalene.

Over the centuries of Christian history and reflection, many scholars have accepted the identification of Mary Magdalene with Mary of Bethany and with a woman sinner who anointed Jesus' feet. Yet, Eastern Orthodox Christians and the

Catholic Encyclopedia of 1910 distinguish these women as three different persons. Although Mary Magdalene has often been claimed to have been a prostitute, there is no specific biblical reference in the New Testament. This misappropriation most likely arises from the town she originated from. Migdal, originally called Magdala, was a fishing town known for women who consorted freely with men.

In the gospels of Matthew 27:55–56, Mark 15:41, and Luke 23:55, Magdalene and Mary, the mother of James, came to Jesus' tomb at dawn on the first day of the week to anoint his body with oils and spices. The tomb was empty. Magdalene ran to tell Simon Peter and another disciple (John 20:1–2). Then she returned to the tomb and, alone, she waited there.

The brief historical evidence we find about Magdalene paired with poetic imagination and combined with certain concepts of psychodynamic and analytical psychology usher us toward meaning at the most definable character of essences. Interweaving psychology with scripture, we see in the narrative of Magdalene a transformed disposition of mind, body, and soul animated by spirit in relationship to Jesus Christ. Further, Magdalene's relationship with Jesus allows us to discern deeper knowledge and insight about the value of symbol and metaphor.

Etymologically, the Hebrew form of the name *Mary*, or *mirjam*, derives from the Egyptian *mr'* (to be loved) and from *rà a*, to see, the seer (Ricci 1994, p. 129). Her receptivity to "waiting" at the tomb is analogous to the depth psychological notion of "seeing" and "seeking." Her witness to the Risen Christ represents a transformation of consciousness, profound change inclusive of the notion of recollected memory at the level of the archetypal and numinous.

The root of the word memory in its most reduced form is *mr*. Closely associated to this root is the Egyptian *mr'*. Imaginatively splitting the *m* and the *r*, and locating the earliest graphic sign for the letter *M* in the image of water, *ma* also becomes the imitative root for the sound a child makes when it desires the source of its nourishment. The reduplicated form of *mr* is "*murmur*" which can be associated with the sound that water

makes (Ricci 1994, p. 129). The two roots combined become a metaphor for the source of nurture, a moist, soothing, maternal, watery reality (Dunne 1988, pp. 116–120).

The letter R originally meant “head” and is close to the Proto-Indo-European roots *ar-*, *or-*, and *er-*. *Ar-*, which means “to fit together,” gives us the Latin *ordiri*, the root of “primordial.” Primordial refers to the original order of things, at-oneness, harmony. Primordial also refers to that which fuels inspiration, what developmental psychologist D. W. Winnicott tells us is the goal of developmental maturity: creativity and *art*.

The basic meaning of *er-* means “to set in motion.” Also from *er-* comes the Latin *oriri* which means “to be born,” or “origin.” If we put the *m* and the *r* together again, we arrive at an image of maternal headwaters giving birth to us, setting us in motion. Psychologically speaking, the transformed Magdalene is analogous to how a mature ego provides a center from which we can generatively unfold, an interior previously unknown or unconscious. This core opens to us in numinous experience, receives us and renews us.

At a deep unconscious level, our “forgotten” or repressed memory strives for *this* source, or perhaps something beyond this foundation. Archetypal spirit – original unity or wholeness – is represented in the first figure a child knows: its mother or primary caregiver. Developmental child psychologist, D. W. Winnicott, reminds us that ideally our biological mother mirrors the archetypal feminine and imparts to the infant the deep inheritance of the self. Yet, due to early developmental trauma, sometimes what we long for can only be experienced as an absence.

Even if we cannot “remember” the source of our being because of developmental injury, there is yet a bridging possibility that will restore to us what was lost or dissociated. St. Augustine of Hippo claims that what we yearn for is the soul we have been dissociated from at birth. We remain in this state until God belongs to the soul in totality: “O truth, everywhere” (Chadwick 1991, *Book Ten* 26, p. 37).

Reestablishing the psychological traces of murmurings in the treasure house of the

imagination – what Augustine identified as *memoria*, the infinite halls of the unconscious – we make our way inward into these spacious caverns, seeking to make conscious what is at “the bottom of the trough.” In the process of depth psychoanalysis and various religious practices, we regress and feel as if we are once again “inside of the mother’s body,” or held by spirit, that feeling of oneness we still had as infants. We can locate a new vantage point from which the ego forms a relationship with the archetypal self of the psyche. Mary Magdalene reconnected to this archetypal self, which crosses the divide between soul and spirit. She ventured into the depths of memory, mourning, and “*mr.*” Whereas the etymological root of *ma-* resonates with the notion of the archaic maternal, *mr’*, in contrast, leads us to the *ground* level, to Magdalene and the empty tomb. Here we find psyche and soul rising to greet the source of spirit.

We can only speculate upon the specifics of Magdalene’s life. In scriptural accounts, there is evidence that something had caused a breakage in her inner world triggering fragmentation for which she sought healing. Whether or not she had been possessed by demons, she had become dispossessed of an authentic self. She needed help to mourn and to remember, to recollect that part of herself that had fallen away. Jesus offered this relationship. Jesus took root in her psychic soils and led her into the well of her own rich archetypal femininity. In learning to yield to the antinomies within her psyche, fertile soil was prepared for spirit.

Mary Magdalene willingly waited at the tomb. As in the Old Irish extension of the root *memor*, or *miraim*, which translates as “I remain,” Mary remained, even though the disciples and other women departed. Remaining provides the necessary period of preparation and formation for the depth of interior feelings in relation to spirit to evolve.

At the intersection of mourning and remembering, a phenomenon emerges where there is a necessary breakthrough to something else, a new sphere of experience (Haughton 1981, pp. 18–47). Winnicott speaks of this breakthrough phenomenon as “*indwelling*,” meaning that

psyche comes to dwell in the body-soma, which leads to an “integrated unit self.” Receptivity does not preclude suffering. Suffering and brokenness at times of psychological crisis, emptiness, or loss translates as living through the death of the ego in its old form, the space of dead-nothing. Magdalene entered “the gap,” the dark interval.

The Empty Tomb

In John’s account of the Easter story (1991, John 20, pp. 1–18), Mary Magdalene arises the day after the Sabbath and comes to the tomb “while it was still dark” to anoint Christ’s body before his burial. After the disciples depart, Mary stands vigil. Jesus’ crucifixion has caused such a profound reaction that the event of his death is experienced as a *void*.

In Winnicott’s terms, one who feels “dead, empty, nothing” has not arrived at the stage of security that he calls the “I am” state of being. Unclaimed and repudiated parts of the self still accompany the individual preventing wholeness because these parts are yet unintegrated bits of being. The ego suffers tremendous anxiety and threat upon nearing integration of these bits, fearing what feels like certain death. To prevent what the ego perceives as its own potential annihilation, it sometimes defends itself by *breaking down or falling into* the gap of madness.

Beneath the defenses of the person is a “something else” which potentially integrates the dissociated aspects of the infantile or child self which have become split-off. These defenses prevent us from experiencing certain intrapsychic dynamics that lead to mature development and the depressive position. The depressive position pertains to overcoming the earlier developmental stage called the paranoid-schizoid position, which is equivalent to a less mature psychological constitution. The depressive position also relates to the capacity to mourn.

In “The Manic Defense” (1935, pp. 134–35), Winnicott speaks of the manic defenses as the way human beings typically defend against the

depressive position. These defenses are related to omnipotent fantasies, “flight to external reality, suspension of inner objects, and denial of sensations.” As means of control, these forms of resistance offer us reassurance through external reality. Rather than experience emptiness, we fill ourselves up; instead of being still, we move; we seek to know and to understand instead of entering the unknown. Above all, we deny death as the ultimate fact of life.

These defenses are resilient because they prevent the innocent pre-egoic self from the beginning of life from being overcome by intense affect that an infant cannot yet tolerate such as severe dissociation. These defenses are still active beneath the surface of the adult psyche. The goal of healing is to get to the experience of emptiness and nothingness and to discover the true self which is creatively alive and real in contrast to the false self of defenses and repression. Only by entering into the original anxiety and experiencing the primal agony can we recollect the missing bits of being and become alive again. Healing entails building belief in good internal objects, lessening the manic defenses, which, in turn, shrinks depressive and persecutory anxieties. We are enabled to link imagination (in contrast to fantasy) to our physical experiences whereby we can create freely from an unlimited imagination, which is preliminary to the evolution of symbolic consciousness. We move beyond shame to healthy guilt.

The Stone Had Been Removed

At the empty tomb, Magdalene faces dread, emptiness, and nonexistence. Fearing that Jesus’ body might have been stolen, she turns to external sources. The two disciples she turns to metaphorically represent the false-self reality. The disciple who outruns Peter represents the manic defenses. He runs ahead, but he does not *go in*; he does not enter interiorly. Simon Peter follows the other disciple and goes into the tomb. Yet, both return to their homes. Magdalene waits.

Woman Why Are You Weeping?

Mary's tears at the empty tomb express grief, loss, and suffering over Jesus' absence. Tears are also a way of seeking, desiring, and restoring. Bending over to look inside, she confronts the darkness. As we enter the empty tomb of our own subjective interior, the ego fears the depths of the unconscious and the death of the false self. Without projections, we feel an acute emptiness.

When She Has Said This, She Turned Around

This phrase represents a first "turning." The first turning still belongs to the transitional arena in which our imagination is churning with new images and feelings. When we continually long for something, it builds its image into us by depositing "a seed" in our psyche. The seed germinates and grows when it finds itself in a nurturing and moist soil (maternal love, Eros, desire, agape love). When the inspired image is secured internally, eventually something new is born of the two, a living third thing which exists midway between our idealized images and the essence of the thing-in-itself (von Baader 1850–1860, p. 8, p. 96).

In contrast, if an infant is surrounded by an environment in which it does not *see itself being seen* by the mother-mirror, but instead perceives an expressionless canvas, then the looking-glass mother becomes an external thing to be looked at but not to be looked into. A seed does not sprout and take root.

Woman Why Are You Weeping? Whom Are You Looking for?

At this point in the scriptural narrative, Mary Magdalene sees Jesus but she does not recognize him. Jesus asks, "woman why are you weeping, *whom are you looking for?*" In the therapeutic arena, we are often mourning the self we have never known. We struggle to gather up the disparate pieces of self that are dissociated and scattered.

When Jesus asks Mary "*whom* are you looking for," however, this phrase underscores the distinction that for Magdalene to *remember* and to recollect the unity of her self is distinct from *mourning*. To remember has to do with spirit beyond the psyche, yet bridged by the psyche.

Magdalene first *mourns the dead Christ and seeks "the living among the dead"* in order to *anoint him*. Only when Magdalene *waits* by the empty tomb of death and descent and faces its depths is she able "to anoint" the dead Christ. Encountering this space of emptiness, where our own images do not reign, allows something more profound to occur within our psyche. "Anointing" the dead Christ has to do with receiving new life, new possibility in this imageless space. The images emerge from the union of psyche and soul, not solely from our egos, and are now in-fleshed.

Tell Me Where You Have Laid Him and I Will Take Him Away

When she first sees Jesus, Magdalene thinks he is the gardener. Winnicott (1958, p. 133) speaks of how some persons do not recognize that the people who inhabit them psychologically are a part of themselves.

Mary!

When Mary sees Jesus, he *calls her by name*. As Mary is named by Jesus, he endows Mary with an identity specifically her own. As a distinct and separate being, she is able to *respond* and to name Jesus in return. Analogous to a child that separates from the mother at the appropriate stage of its development, Mary can now witness Jesus from her own subjective nature as a separate person. Similarly, a therapist, as a significant other, "names" a patient through reliable person-to-person presence, receiving the spontaneous gesture and allowing for the omnipotent infant self to come forward to achieve the developmental

culmination of the early stages of life. A container is provided for spirit to enter and to engage with psyche reminiscent of the image of the well-known attribute of Magdalene – the alabastron – a symbol in ancient and modern times of the eternal feminine.

She Turned and Said to Him, “Rabbouni”

The scriptural narrative does not indicate that Mary has ever turned away from Jesus in the first place. The *pivotal point* is that when the angels first ask Mary why she is weeping, she cannot recognize Jesus as the Risen Christ but only through her own projections, as a gardener. Then, in contrast to a bodily act, when we turn the second time, we come to know that we are separate but related to the *divine* source who meets us in the dark night of the imageless space. There is no one other than God who is capable of being such a reliable and eternal mother-mirror. If we are fully given to this source, we are transformed into the same image. In psychological terms, this moment of self-reflection would be an instant when perception gives way to apperception, when “object” turns into a “subject.”

The text of a prayer by St. Anselm of Canterbury (1033–1109) grasped this complex transformation when he said of Mary Magdalene that “Christ was *hiding* himself from you when you were *seeing* him and *revealed* himself to you when you were *not seeing* him; until he whom you were seeking, *asked you whom you were seeking and why you were weeping*” he could not be anointed. Only when the Risen Christ is present to her *actually*, flesh resurrected in spirit, and *anoints* her does she recognize him.

We can look into the psyche and think we “see him,” but he is hidden from us, for whatever reasons of human defense structures. When Christ does reveal himself, we may *not* “see him” because we are caught in our own projections. The second turning, then, is a profound transfigurative moment for Mary as well as the Risen Christ. We see all essences in their restored, eternal form. It is the eternal essence of the Risen Christ who Mary greets as “Rabbouni.”

Master!

Magdalene returns to the starting point – *memor* – something folding back upon itself. Making conscious the depths of *memoria* gives us witness to the true source that Magdalene perceives when she exclaims, “Master.”

Do Not Hold on to Me

Jesus is both human and divine, never merely an *image* of God, nor merely a psychic internalization. Yet, his image received and internalized in Mary is a portal to the mysteries of the trinity and a presence that will never leave her. “*From now on you do know him and have seen him*” (John 14: 7). This phrase translated in the *New English Bible* as “do not cling to me” urges Magdalene not to cling to old projections, nor to dismiss the efficacy of what she has witnessed thus far.

I Am Ascending to My Father and Your Father, to My God and Your God

Jesus includes Mary Magdalene in his final transformation, indicating the potential for others to become whole selves. The phrase “my father and your father, my God and your God” infers a specific kind of dependency that is beyond psychological categories and belongs more to the arena of faith.

What Magdalene experiences is definitively more than the restoration of the lost object in the psyche, more than the integration of psychic contents. In the first turning, she mourns the loss of the idealized object in relationship to the historical person of Jesus. She encounters *a new psychical reality*. In the second turning, she encounters *the spiritual reality* of the Risen Christ in which spirit has bridged psyche and psyche, spirit, making it possible for her to participate in *actual* presence, resurrected presence.

As this love comes back into the world, we find a mother restored. His death becomes our death, his resurrection, our resurrection. Our participation leads us into the maternal headwaters to the

mother before the mother, the object behind the object, who becomes a subjective interior reality, as well as a lived, embodied reality. Mary Magdalene returns to her community. True to the derivatives of her name, she becomes “rà a,” a seeker and seer of internals and externals, a woman of multiple realities, one who participates in two worlds, an inner and an outer world which leads her to exclaim:

“I Have Seen the Lord”

The glory of Christ is not visible in itself. Glory is a reality that can be expressed only as recognized by another, at a juncture where the opposites of otherness are met and suffered. The impact of this notion is that Christ dies and rises in a way that is visible to others, which others can attain.

Mary Magdalene not only witnesses Christ’s second birth, *she rises with him*. As Jesus sheds his burial cloths, Magdalene sheds the skins of her former self. Jesus gives her everything that is *already* hers. She dies unto him whose body disappears, but rises. In his return, she is born with a physical meaning of her own. Spirit conjoins with flesh, and flesh returns to life and incarnates. Her resurrection is different from his and her response has its own characteristics. Mary, too, has risen.

The redemption of matter might be configured in the psychological arena as two persons in relationship who comprise opposite but complimentary terms. A third constituent arises from the psychic vessel that the two persons create together. The opposites undergo a process of transformation and restoration. As the life-giving essence is restored, a fourth element arises which is spirit in matter. This becomes the basis for our wholeness and grounds us in space, time, and history (Von Baader 1851–1860, 2, p. 243).

In returning, our relationship to material reality changes. We participate in our own freedom and also in a redemptive historical process. As nature is redeemed, so is the creative feminine element, the god-bearer. Mary Magdalene offers an exquisite feminine ground to illustrate the embodiment of a psychological principle: that beyond our internal projections and introjections, beyond

history, but in history – *when we mourn, when we remember* – we anoint, *but first we must wait to be anointed*.

Masculinity

Myounghun Yun

Graduate Department of Religion, Vanderbilt University, Nashville, TN, USA
Succasunna United Methodist Church, Succasunna, NJ, USA

Masculinity is a culturally and theoretically complicated concept and phenomenon. Culturally it is often assumed as natural, biological, and stable. Being understood as the opposite of femininity, masculinity tends to be noticed only in the case of

its absence or extremity (Reeser 2000). Such a relative invisibility and the lack of articulation reveal the nature of masculinity and the role of power and privilege in deciding what should be considered normal and natural. Theoretically, there is a less clear consensus about the meaning of masculinity. Researchers do not necessarily agree on what they actually mean by masculinity. Masculinity, as a hypothetical construct, has been conceptualized in a variety of different ways: as a set of practices, an ideology, a gender role, psychological/personality traits, and/or power and dominance. First, masculinity is defined as a set of practices or performance. This way of understanding is drawn widely by scholars in humanities (Butler 1990). Second, masculinity is treated as an ideology regarding one's attitudes and beliefs about what gender norms exist for men whether they are appropriate or not. Third, masculinity is understood as a gender role, which is actually not a fixed state but a condition under active and social construction. Fourth, masculinity is conceptualized as psychological/personality traits that often function as rigid gender stereotypes in a given culture (e.g., masculinity as strong, tough, aggressive, competitive, dominant). Finally, some feminist approaches identify masculinity itself with power and dominance, thus problematizing it as something that needs to be deconstructed and even eliminated.

In terms of logic, we can lay out at least four main strategies or approaches to masculinity: essentialist, positivist, normative, and semiotic (Connell 1995, pp. 68–71). First, essentialist approaches focus on “the core of the masculine” such as masculinity as activity in contrast to femininity as passivity. The problem of this approach is the arbitrariness of the choice. Second, positivist definitions are concerned with “finding the facts” about masculinity, which functions as “the logical basis of masculinity/femininity (M/F) scales in psychology” or “the basis of the ethnographic discussion of masculinity in a given culture” (Ibid, 69). Third, normative approaches define masculinity as what men ought to be or a social/cultural norm for men's behavior. Fourth, semiotic approaches define masculinity through “a system of symbolic difference in which

masculine and feminine places are contrasted” (Ibid, 70). Despite its usefulness in cultural analysis, it has a limited scope because it grapples mainly with discursive sphere, not with gendered places in production/consumption and social/institutional struggles.

Psychological/Psychoanalytic Approaches

The work of Freud was groundbreaking as the first sustained attempt to construct a psychological, scientific account of masculinity, though it is not a systematic one. As Freud noted, the concept of “masculine” alongside “feminine” are “among the most confused that occur in science” (Freud 1905, pp. 219–220). Freud explores the development of sexual life of men and women, based on his everyday clinical observations. In his discussion on the theory of bisexuality and psychological hermaphroditism, Freud acknowledges that there are masculine and feminine elements in every human being. He sees masculinity and femininity as the characters of respective sexes, which could potentially be inverted in one's psychical development, based on a narcissistic basis. Even though Freud does not suggest the physical basis for masculine or feminine behaviors/traits, he assumes a somewhat fixed, universal set of masculine or feminine traits and characteristics that correspond primarily to one's biological sex. Freud's classical psychoanalytic account of masculinity was criticized for its preoccupation with phallus by such feminist psychoanalysts as Karen Horney (1937) and later Nancy Chodorow (1978). Dimen and Goldner explain that “Freud's idealization of phallic masculinity not only erased and debased femininity as a category and as a lived, embodied self experience, but also delayed the theorization of masculinity in all its specificity and multiplicity” (Reis and Grossmark 2009, p. 4).

Hegemonic Masculinity

Contemporary theorists have argued for the multiplicity and fluidity of masculinities with their

clinical and theoretical implications (Messner 1993; Connell 1995; Person 2009). Psychologist Ethel Person presents masculinity as a multiple entity, calling attention to a wide range of masculinities that exist and can be observed, not only within different cultures but also within any one culture. Masculinity is something that is continually constructed and transformed in relationships, rather than monolithic or unitary, in essence, a given. Men are situated in different roles, religions, and/or nationalities, which lead to “different systems of belief regarding what constitutes optimal masculinity and what kind of relationship is to be sanctioned between men and women” (Reis and Grossmark 2009, p. 2). Importantly, acknowledging the multiplicity of masculinities leads to the recognition of dominant, idealized forms of masculinity as a benchmark against which all men and women are measured and gauge their success in gender order and hierarchy. Sociologist Raewyn Connell (2005), a key contributor to the research on men and masculinity, explains it as the concept of hegemonic masculinity, which refers to “the configuration of gender practice which embodies the currently accepted answer to the problem of legitimacy of patriarchy, which guarantees (or is taken to guarantee) the dominant position of men and the subordination of women” (Connell 1995, p. 77). According to Connell, the task of being a man involves taking on and negotiating hegemonic masculinity as largely unreachable set of social norms and ideals, and gender power is reproduced in oppressive forms because men are complicit with hegemonic masculinity. As a slippery and contested term, however, the concept of hegemonic masculinity has faced serious criticisms as it has been examined at various dimensions, such as social struggles for power and political leadership, public and private violence, and changes in families and sexuality (Connell and Messerschmidt 2005).

Crisis in Masculinity or Crisis for Men

Scholars in the study of men and masculinities have addressed “crisis for men” or “crisis in

masculinity” as a shared concern, though others view it as a matter of interpretation because of the lack of empirical evidence. Generally, the notion indicates that men as a social group are experiencing problems “at a rate disproportionate to their numbers and with uniqueness that seems to be a part of the lived world of men” specifically in the three areas: male violence, higher education, and health concerns (Kahn 2009, p. 165). Regarding the interpretation of crisis in masculinity, broadly three approaches to this issue can be identified: essentialist, psychosocial, and social-constructionist. First, the essentialist approach claims that the reversal or violations of traditional gender roles lead to social and moral unraveling, including the crisis of masculinity. It thus argues for the maintenance or restoration of traditional behaviors or the recovery of what they consider to be “real” or “true” masculinity. By rejecting the essentialist idea that there is a true or correct way of being masculine, psychosocial view affirms that masculinity is culturally and historically shifting and diverse; thus, there have been multiple ways to be a man. The crisis of men results from men’s conflict with or maladjustment to shifting social and cultural expectations about masculinity. Finally, according to social-constructionist approach grounded in feminism focuses on how gender power, patriarchy, and male hegemony shape our understanding of and approach to the crisis in masculinity. Masculinity in crisis is a result of a firm belief in and unawareness of male privilege and persistence to maintain it in the midst of the conditions men experience as a loss of rights or access to privileges. However, it does not mean that all men experience the crisis of masculinity in equally same ways. Based on their positions of power, some men are placed in marginalized and subordinate roles, though men are not often aware of the fact that they receive both benefits and pain from patriarchy. In this regard, sociologist Tim Edwards (2006) makes a helpful distinction between “the crisis from without” and “the crisis from within,” which are often conflated. “The crisis from without” refers to problems pertaining to the position of men in the family, education, and work, while “the crisis from within” focuses on “a perceived shift in

men's experiences of their position as men" often represented by "their sense of powerlessness, meaninglessness and uncertainty" (Edwards 2006, pp. 7–8). Such a distinction implies that even though men as a group or individual can be considered to be stuck in crisis from an outsider's view, they may not necessarily experience it as a crisis in terms of an inner sense of masculinity.

Religious Approaches to Masculinities

The intersection between men (masculinity) and religion are "dynamic, elastic, complex, creative, and filled with historical and political significance at specific moments in time" (Krondorfer 2009, p. xii). Although men have articulated, meditated on, and practiced religions throughout history, the scholarship dedicated to the critical study of masculinities in religion has had only a short history. The term "critical" in "critical study" refers to the attempt to argue against "reifying heterosexual and heteronormative claims" while arguing for "a critical reading of the privileged performances of men and normative models of masculinity within religious traditions" (Boyd 1996, p. xix). To explore the contours of men's studies in religion has confronted some theoretical and practical challenges in terms of its relationship to other disciplines and the continuous suspicion about the field as just another way to talk about privileged religious men. Feminist scholar Judith Gardiner (2002) points out that many feminist, especially under the influence of the second-wave feminism, had problems with masculinity for two reasons: (1) feminist thought's association of masculinity with "the institutional practices, attitudes, and personality traits of men that uphold male dominance and oppress women" and (2) the concept as "a slippery entity without consistent content" (Gardiner 2002, p. 3). More importantly, feminists point out a problem that contemporary men's studies focus less on men's power over women and instead more on relationships between men. Regarding the intersection between religions and masculinities, four central themes can be identified (Krondorfer 2009, p. 52).

First, the critical approach to men and masculinities has examined the ways in which being religious affects men's sense of masculinity, including analysis of a wide range of religious traditions, such as fundamentalism, liberal Protestantism, Evangelicalism, the Black church, Judaism, and Islam traditions. Since contemporary social scientific research on men and masculinities has not paid much attention to the influence of religious traditions and spirituality in forming and transforming men's self-identity as men, this line of inquiry fills a gap in the research by investigating such issues as the dialectic between imagery of the divine and the construction of masculinity (Boyd et al. 1996, p. 33). By recognizing the power of religious traditions over the lives of individual men and women, these critical approaches to religion's connection with masculinities avoid a conceptual trap which often leads scholars to separate the theoretical examination of religions from the domain of power.

Second, the critical study of men and masculinities has explored the influence of sexist, heterosexist, racist, and classist definitions of hegemonic masculinity on religious ideas and practices, such as ritual practices, sexual ethics, social ministries, and pastoral authority. Just as particular religious traditions shape men's understanding of themselves as men, the operant definition of masculinity and men's self-understanding also affect the ways they grasp, appropriate, reject, or partake in religious/spiritual practices and institutions (Ibid, 77). The consideration of race, class, sexualities, age, ethnic, and colonial positioning in understanding masculinities rejects the singular focus on gender to the exclusion of other crucial variables.

Third, critical men's studies in religion has also been concerned with the effects of male experiences and various constructions of masculinities on the religious and spiritual dimensions of men's relationships to women, other men, children, and nature. Finally, critical men's studies in religion have examined the ways religious rhetoric and practices have shaped men's movements and their effects on political and religious life. During the last two decades, various organizations and

movements have come out of different ways of perceiving and diagnosing men's reality in American society (e.g., Profeminist Group, Men's rights movement, Promise Keepers, and Million Man March). While Profeminist groups focus on overcoming the destructive nature of patriarchal masculinity and dealing with the limitations of gender roles, the men's movements such as the Million Man March, the Promise Keepers, and Mythopoetic men's movement have been concerned to varying degrees with spiritual dimensions in men's lives. Professor of religious studies Stephen Boyd notes that many contemporary men's movements identify "the malaise of masculinity as fundamentally spiritual or religious in nature" (Ibid, 171). Traditionally, religious and spiritual dimensions have often been associated with women and femininity; therefore, masculinities based on the rejection of the feminine face a difficulty integrating the spiritual dimensions. Despite the challenge, it is important and necessary for some to recover or strengthen the spiritual dimension in men's lives. For others, it is considered more crucial and urgent to reject or partially reject traditional religious expressions and institutions and to find a value in alternative myths, rituals, and communities.

Maslow, Abraham

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

Born on April 1, 1908, in Brooklyn, New York, to uneducated Jewish immigrants from Russia, Maslow was the eldest of seven children in his

family. Maslow's parents pushed him into academics, and he received his degrees – BA, MA, and PhD in Psychology – from the University of Wisconsin in 1930, 1931, and 1934, respectively. During his early research career, Maslow worked with Harry Harlow and E. L. Thorndike, and he became interested in attachment behavior and human sexuality. Maslow started his teaching career at Brooklyn College, and he chaired the Department of Psychology at Brandeis from 1951 to 1969. During his professional life, Maslow met with many intellectuals – chiefly, Adler, Fromm, Horney, and Kurt Goldstein, as well as several Freudian and Gestalt psychologists. He died of a heart attack on June 8, 1970, in California.

Hierarchy of Needs

The Maslowian model of the hierarchy of needs is a critique of Freud's pessimism and Darwinian survival of the fittest, but this model finds little hope in Skinner's behaviorism. Maslow did see a difference between people and animals, and even he emphasized looking at the brighter side of the human psyche. Maslow argued that the study of stunted, crippled, unhealthy, and immature specimens would produce only a cripple psychology and a cripple philosophy. For that reason, in his theory of motivation, Maslow examined the finest specimens of the species – for example, Albert Einstein, Abraham Lincoln, Jane Addams, Frederick Douglass, Martin Buber, Eleanor Roosevelt, and Albert Schweitzer.

In his hierarchy of needs, Maslow proposed five broad levels of a pyramid, starting from psychological needs at the base and reaching self-actualization at the top. In between these two extremes, he placed safety needs, belonging needs, and esteem needs. The four levels below self-actualization are known as “deficit needs” or “D-needs”; also, Maslow extended the homeostatic principle to the needs, which states that when human beings lack something, they develop a hunger for it. For self-actualization, Maslow employed various terms, such as “growth

motivation” and “being needs” or “B-needs.” Maslow claimed that needs were also like instincts, and he named them “instinctoid.”

World Religion and Hierarchy of Needs

What makes human beings different from animals is probably that human beings have religions and animals do not have any. Religious understanding encourages us to move beyond pure animal instincts and to strive for self-actualization, or salvation, or enlightenment. Three needs – physiological needs, safety, and love/belonging – are similar in animals and humans; however, religions fulfill humans' higher needs, i.e., the need to respect others and to be respected by others, the need to gain confidence and a sense of achievement, the need to be creative and moral, and the need to solve problems and minimize prejudices. Once our baser needs are satisfied, we move to higher-level secondary needs.

Maslowian self-actualization is often marked by spiritual and mystical experiences. The need for self-actualization is actually a desire to become more and more what one is capable of becoming. In Confucianism, Confucius talks about achieving human goals by becoming more fully human and by attaining human virtues. Hinduism states that human beings are actually spiritual beings, having human experiences. Mahayana Buddhism goes beyond self-actualization to reach the transcendental level as a Bodhisattva. Islam and Judaism focus on both higher- and lower-level needs. Islamic Shariah laws are similar to Maslowian needs: there are religious laws for education, family, preservation of life, property, and the utility of religion. Judaism and Jainism provide dietary laws to protect morality as well as health. Sikhism gives emphasis to honesty and charity; moreover, family values and community bonding are also considered important.

Many Eastern religions, including Hinduism and Taoism, give preference to vegetarian, natural, and organic foods over nonvegetarianism. Though eating/physiological needs are at the lowest level of the Maslowian pyramid, abstaining

from food (fasting) is a common practice in Hinduism, Islam, Buddhism, the Baha'i faith, Jainism, and suchlike. The four goals of Hinduism are closely related to the hierarchy of needs: *kaam* ("seeking pleasure") is associated with physiological needs; *artha* ("earning and seeking money") is associated with safety needs; *dharma* ("fulfilling one's role in society") is associated with esteem and love/belonging; and *moksha* ("realizing God") is associated with self-actualization.

Masochism

Jaco Hamman

The Divinity School, Vanderbilt University,
Nashville, TN, USA

German psychiatrist Richard von Krafft-Ebing coined the word masochism in 1869 after his reflection on the life of novelist Leopold von Sacher-Masoch (Nacht 1995). A paraphilia, masochism's primary context, is sexual relationships, describing the experience of an individual receiving erotic satisfaction from real or imagined personal suffering, in being humiliated, and in the

relinquishment of power. Masochism is often identified with sadism in sadomasochistic relationships (Loewenstein 1957).

As self-inflicted suffering, however, masochism can have a moral character as satisfaction is gained by becoming a victim. In religious masochism, the body is hurt for the sake of the soul (Ghent 1999; Glucklich 2001). In many western as well as eastern religions, experiencing personal pain becomes sacred as the producer of altered states of consciousness, a pathway to detachment, or an agent of purification.

Psychological understandings of masochism are diverse, ranging from the suppression of inner guilt caused by outward aggressive drives (Freudian) (Freud 1957); activity of the shadow and the archetypal need to worship (Jung); the persecution of internal objects (object relations theory) (Berliner 1995); frustration with a primary, non-nurturing self-object (self-psychology) (Menaker and Barbre 1995); a disembodied self (Gestalt theory); or a significant cognitive distortion (cognitive therapy).

Increasingly and especially in the context of religious experience, the portrayal of masochism in pathological terms is questioned.

Matriarchy

Elizabeth Welsh

Fuller Graduate School of Psychology, Pasadena, CA, USA

The term is defined in three ways. One refers to gynocracy or a family, group, or nation governed by a dominant woman and more specifically a mother who is the head and ruler of her family and descendants. A second meaning refers to matrilineal organization or a social system in which descent and inheritance are passed on through the female lineage. A third meaning, matrifocality, refers to the centrality (though not domination) of women, especially mothers.

Gynocentric organization can be found in many nonhuman populations which are centered around alpha females. Examples include ants, bees, pygmy chimpanzees, elephants, killer

whales, spotted hyenas, desert mole rats, and termites. Another notion linked to the hypotheses of matriarchy is parthenogenesis or asexual reproduction in females which continues to exist in most lower plants as well as in some invertebrates and vertebrates. Parthenogenetic reproduction has been connected to the origin myths circulating among primitive cultures which recognized the role of female primacy in the creation of human societies. The idea of the female primeval creative force could be found in many of the earliest human writings and art forms such as those of Ancient Egypt.

The notion of matriarchy in humans emerged within the field of anthropology in the context of nineteenth century theory of cultural evolution. The latter posited that the human species “advanced” from primitive matriarchal social organization to patriarchal systems at the same time as it progressed from a polytheism that included the worship of multiple great goddess figures to a monotheism centered on a single male divinity. Anthropologists have also hypothesized that patriarchal impositions developed as people realized the link between paternity and pregnancy; however, clear evidence for this theory has been lacking. Nonetheless, in some fields such as comparative religion and archeology, the hypothesis of pre-ancient matriarchal systems has continued to be explored and used as basis for various ethnographic theories which have attempted to resurrect the female elements from a misogynistic and sexist cultural history and reestablish gender balance. In spite of the disparity of views regarding the actual gender relations in pre-ancient societies, scholars generally agree that Neolithic societies were more egalitarian than those of later periods.

Currently, most anthropologists concur that there is no evidence for the existence of matriarchal societies in the primary sense of the term but that matrilineal/matrifocal groups have existed in various places for many centuries. The following are current examples of social structures which have maintained an ancient tradition of passing on of inheritance, name, or group membership through the female line and of giving women central roles in family and community affairs

(though religious and political affairs are still reserved for the male domain): various communities in South India (e.g., in Kerala, Tulu Nadu, Mangalore, Udupi, Tamil Nadu) and Northeastern India (in Meghalaya); the Malikun on Minicoy Island; the Minang communities in West Sumatra, Indonesia; the Mosuo people of Southwestern China; the Tuareg communities of Western Sahara; the people of the Huron, Cherokee, and Iroquois Confederacy; and the Navajo, Hopi, and Gitksan groups in North America. Furthermore, in Orthodox Judaism, while the laws of inheritance follow the father, the laws of descent are matrilineal.

Theories of matriarchy have received most attention in the field of archeology. The notion of an archaic matriarchy that was subsequently overturned by patriarchal rule was primarily introduced by Johann Jakob Bachofen in his 1861 publication, *Mother Right: An Investigation of the Religious and Juridical Character of Matriarchy in the Ancient World*. A systematic study of myth traditions led Bachofen to propose that the prehistoric civilizations were marked by three stages: in the first hetaeric stage, males had unrestricted access to all females; in the second stage, females overturned this unfavorable arrangement and established monogamous relationships and mother right, or matriarchal groups, along with an extremist variant, the Amazons; and in the third stage, matriarchy was permanently ousted by patriarchy with its male-dominated institutions which marked the beginning of women's disenfranchisement.

Although the exact characteristics of these hypothesized archaic matriarchal systems cannot be established with certainty, some general features have been proposed: (1) the female family name is retained; (2) children follow the female line; (3) movable and immovable property remains in the hands of the woman and is inherited by daughters, while sons only receive a dowry; (4) the difference between legitimate and illegitimate birth disappears; and (5) the woman becomes the wooer. The least disputed features are those that pertain to matrilineality. Examples include records concerning the prehistoric Lycian people whose families appeared to be organized

according to the matrilineal principle, as evidenced in the Herodotus accounts of the Lycians who did not name their children after their fathers like the Hellenes but after their mothers, and the testimony of Nicolaus of Damascus who asserted that only the daughters possessed the right of inheritance, a tradition traced to the Lycian common law.

Other characteristics are not clear. There are inconsistencies in the delineations of matriarchal features regarding sexual relations. For instance, some scholars like Bachofen argue that it was through matriarchal rule that monogamous relationships were instated not through patriarchy. Others say that matriarchy was characterized by promiscuity, that women were having sex indiscriminately, and that through patriarchy, men established monogamous marriage relationships so as to ensure that their progeny was indeed theirs. In support of this latter thesis, scholars have turned to the patriarchal rhetoric of various Greek myths which contain traces of possible preexisting or contemporary forms of matriarchy. For example, female rule was equated with animal bestiality and promiscuity which patriarchal rule "corrected" by establishing the institution of marriage (one woman for each man) so that men knew who their children were. Greek myths also reveal that underneath various marital conflicts was the male effort to suppress the woman's attempts to overthrow the established male-dominant order and the setup of a bestial, promiscuous, and female-dominated arrangement (matriarchy implied). A prominent example is that of Agamemnon and Clytemnestra. Clytemnestra's reprehensible repudiation of marriage and revenge on her husband for sacrificing their daughter, Iphigenia, were explicitly portrayed as disastrous to cosmic order for the implied reason that her acts were negating the male order and overturning patriarchal institutions and values.

Bachofen's theory has inspired numerous studies as well as controversies regarding the characteristics of such Neolithic matriarchal communities as well as the historical process that led to their development. Many scholars have subsequently argued that the ancient struggle between matriarchal and patriarchal rule is

implicit in the rhetoric of numerous Greek myths. However, most of the arguments for the existence of matriarchal societies are based on speculation.

Commentary

The question of the existence of matriarchy poses difficulties for feminists because it is asked within a historical framework that is phallogentric, or based on the accounts and interpretations of ancient texts and artifacts have been written by males. Recent trends in feminist thought (also named "third-wave feminism") have abandoned matriarchal theories and critiqued the notions of any one gender, race, or social group holding power over another. In fact, the very term "matriarchy," or rule by a female/mother, implies a notion of power that is more congruent with the misogynist hierarchies of patriarchy than with any form of female social influence that may have characterized the pre-ancient world. Thus, the language itself used in the discussions of matriarchy is questionable because it emerged within a discourse tainted by oppressive systems of power that were based on exclusion, domination, and violence.

In psychoanalysis also, the question of whether matriarchy ever existed is problematic since from the psychic perspective historical reality is never objective, but it is always an amalgam of actual or imagined events and unconscious fantasies which shape our collective unconscious. The latter is expressed in the myths as well as the interpretive narratives we call "history." The archaeological examination of ancient myths, art, and artifacts clearly assumes the existence of a "matriarchal consciousness" (which may or may not have had a material component) which early civilizations vehemently attempted to exclude and destroy by means of adopting its opposite: the patriarchal male-centered consciousness. From the psychoanalytic perspective, the very rancor of the misogyny in some early cultures, the extreme forms of patriarchy adopted in certain groups, as well as the eventual universality of the patriarchal system point to a violent repression of the generative powers of female sexuality in the ancient world.

Freud recognized the dynamics of the repression of incest love for one's mother which characterizes identity development, but his phallogentric interpretations have offered a limited understanding of the patterns of patriarchal oppression of females. A more recent psychoanalytic scholar, Julia Kristeva, explains that the roots of the cultural abjection and fervent efforts to dominate women stem from aspects of the individual's early psychic processes of separation from the mother. In early infancy, the newborn exists in a state of undifferentiated physical and psychic fusion with the mother. This maternal space in which the baby is immersed is characterized by fluid physical and psychic boundaries as well as undifferentiated emotions and sexual drives. It precedes language; it is capable of generating the energy which helps fuel the subject's meaning making, or signifying process, which at this point consists of echolalia, glossolalia, rhythms, and intonations of an infant who does not yet know how to use language to refer to objects. In this early psychic space, the infant experiences a wealth of drives (feelings, instincts, etc.) that could be extremely disorienting and destructive were it not for the infant's tactile relation with its mother's body which provides orientation for the infant's drives. At the same time, as the maternal realm provides emotional exhilaration and jouissance for the infant, it can also become suffocating and stifling as the infant becomes increasingly aware of its separateness from the mother as well as its continued dependence on her. The infant must gradually reject and expel the mother's realm from which it must emerge and separate in order to develop as an autonomous subject. The violence of the expulsion attempts reflects the infant's arduous struggle to resist the powerful pull of fusion with the mother's body and return to the uterine realm of plenitude. Thus, the maternal space represents at once abundance and sufficiency as well as the threat of suffocation and death of the emerging subject. From this perspective, the ancient lure as well as inconceivability of matriarchy and the extreme imposition of patriarchy would seem to have its roots in the psychic rejection of the ever-seductive maternal realm and the idealization of

the paternal image in the hope of permanently erasing the threat of undifferentiated/psychotic fusion with the mother. In modern Western consciousness, this dynamic seems to have become even more entrenched and solidified during modernity when philosophical rationalism and scientific reasoning led to the conceptualizations of human identity as a rational and carefully bounded entity that could be studied scientifically.

Matter, Theories of

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

The conflict between religion and science is a result of disagreement between religious leaders and social scientists on the issue whether God

exists or not. The Christian Church initially rejected Dalton's atomic theory that proposed that all matters were composed of indivisible and indestructible atomic building blocks. The Church believed that Dalton's progressive views were heretic as they were associated with an atheistic philosophy. However, at the present time they are considered as the foundational principle of Chemistry. Long ago before Dalton, ancient Greek philosophers such as Leucippus, Democritus, and Epicurus are credited for originating, developing, and elaborating the theory of atomism, respectively. According to the atomists, the natural world is composed of individual physical bodies or atoms and void, i.e., empty space between atoms.

Theories of Matter: Christianity

Epicurus was among the first philosophers who developed the theory of materialism; he proposed that the highest pursuit of life should be the pursuit of pleasure. Later in the second and third centuries, St. Augustine, a key figure in Christianity, established early Christian attitudes toward Epicureanism in his *handmaiden formula* where he discussed the Christian pursuit of natural science. In thirteenth century AD, St. Aquinas in his *Summa Theologiae* promoted the Aristotelian philosophy, and transferred some of its elements into the Christian theology, but he also argued why earth could not be both eternal and created. Aristotle's views dominated Christian theology and the Western education system until the sixteenth century. Also, Gassendi (1592–1655) and Boyle (1627–1691) revived the Epicurean notion of atoms and Christianized atomism.

Theories of Matter: Marxist Perspective

Theories of matter state that only matter exists, and everything in this world, including human beings, animals, and vegetables, are just a manifestation of the matter. This universe is made up of physical matter, and it operates within the bounds of physical laws. According to popular

major religions, including Christianity, Buddhism, Jainism, Hinduism, and Islam, the theories of matter are unreligious. These religions chiefly claim that: (a) God exists; (b) the universe has a beginning; and (c) there is life after death, and their main objection to the theories of matter is that if we agree to them then there will be no or little space for human feelings and emotions, hope, spiritualism, sin, human thought, free will, and faith.

Contrary to the claims made by the major religions, Marx believed that religion was an idealist phenomenon, therefore a secondary feature of human existence. Drawing from Feuerbach's thesis "that gods are projections of everything that is noble and good," Marx further extracted that religion was illusory, other-worldly, and unreal, and it had no place in the real world of living, pulsing, and breathing of mankind. But if we follow Marxist perspectives on religion literally, then there are so many things at stake since religion is not only a matter of faith but also a matter of morality. In a godless society, the theories of matter will only promote accumulation of warfare (e.g., ISIS), acquisition of material goods (e.g., Capitalism), and preservation of petty self-interests (e.g., corruption). For that reason, the religious leaders and spiritual gurus often criticize Marx on the grounds that a faithless society will only promote lust, immorality, false comfort, envy, and idolatry. Moreover, people will become extremely self-centered and consequently human virtues, such as compassion, kindness, morality, and benevolence, will gradually decline.

Theories of Matter: Hinduism and Jainism

Many religions, including Hinduism and Jainism, comment on the theories of matter. Hindu scriptures and Jain religious texts explain the existence of atoms as the building block of matter. The *Nyaya Vaisheshika* School of Hindu philosophy regards matter as the aggregate of atoms, further it believes that accumulation is the cause of karmas and a source of bondage. The atomic theory of Jainism provides deep insight into the mysteries

of the material world, and it suggests solution to the problem of the suffering of mankind.

Considering that matter plays a significant role in the lives of people, the Jain priests had studied matter, its various aspects, and how to overcome its impact on our lives. According to Jainism, *Jiva* "soul" is a mass of pure consciousness in its pristine state, devoid of grossness or coarseness. However, when *Jiva* enters the mundane world it gets polluted and becomes subject to the laws of karma. Jainism believes that *paramanu* "individual atoms" come together to constitute *pudugala* "matter."

Max Weber, Spirit of Capitalism

Dan Mills

Athens Technical College, Athens, GA, USA

First published in 1904–1905, Max Weber's *Die protestantische Ethik und der "Geist" des Kapitalismus* made an immediate impact in sociology and continues to elicit analysis, debate, and criticism. In this text, Weber explores the influence of Protestant thought on the individual

alongside the contemporaneous rise of a market-driven economic system in the early modern West. The very title contains the complicated term *Geist*, which had been important to German thought even before Hegel, as it can mean “mind,” “intellect,” “ghost,” and of course “spirit.” Weber’s *Protestant Ethic* elicited immediate critical debate, and in subsequent writings Weber responded with considerable hostility to critics who believed he had not adequately incorporated aspects of psychology into his discussion of the Protestant ascetic ethic. At one point, Weber (2002, p. 226) even refers to “the uselessness of what passes for ‘psychology’ as a means of historical explanation of phenomena.” In spite of, or perhaps because of, its polarizing effect on its readers then and now, Weber’s text remains relevant among sociologists, early modern scholars, Protestant theologians, and Marxist historians.

Although much of the early criticism of Weber’s text focused on a perceived lack of psychological depth, Weber nonetheless frequently refers to psychology and psychological concepts in the *Protestant Ethic*. Weber (2002, p. 69, Weber’s emphasis) writes that he seeks to discover Protestantism’s “psychological drives [*Antriebe*],” which controlled people’s behavior, and not “ethical compendia” that arose through “Church discipline, pastoral care and preaching,” which came about through “purely religious ideas.” Because of its “doctrine of grace,” according to Weber (2002, p. 87), Lutheranism did not explain *Antriebe* as a “systematic conduct of life” that enforced a “methodical rationalization of life.” Calvinism’s notion of predestination, however, consisted of a “logical consistency” that provided “psychological efficacy.”

In one of his own notes, Weber explains that he does not believe psychology’s “conceptual basis” useful for his project because its “terminology” would lead of an “amateurish” elevation of the “directly comprehensible and even trivial to the level of scholarly erudition.” This would create, according to Weber (2002, p. 158), a “false impression of an enhanced conceptual precision.” In another of his own notes, Weber (2002, p. 276) criticizes his contemporary Werner Sombart’s belief that entrepreneurs exhibit “tendencies”

that highlight an entrepreneurial psychology, and instead characterizes entrepreneurial behavior as “pragmatic” and “rational” because it serves as a “means to an end of economic success.”

Weber wrote elsewhere on religion, notably in his *Religionssoziologie*, a word he himself coined (*Sociology of Religion*). Weber (1965, p. 107) in this text argues that religion creates a “psychological need to reassurance as to the legitimacy or deservedness of one’s happiness,” which can include political, economic, physical, or romantic success. Weber (1965, p. 131) also claims that Christianity removed salvation from the arena of knowledge, academics, legal study, psychological or cosmic etiology for suffering, epistemological accounts of the “mysterious significance of the sacramental rites,” and the expectation of an afterlife. Weber (1965, p. 166) believes that salvation may require “formal withdrawal” from society, including “social and psychological ties with the family, from the possession of worldly goods, and from political, economic, artistic, and erotic activities” which can lead to “alienation from god.” Weber (1965, p. 237) argues that many “anti-erotic religions, both mystical and ascetic, represent substitute satisfactions of sexuality conditioned psychological needs.”

A brief survey of critical response to Weber’s text demonstrates its continued relevance. Rotenberg (1975, p. 52) argues that although the *Protestant Ethic* enhanced a “scientific” and “rational” understanding of “psychopathology,” the foundational tenets of Protestantism and other “people-changing” religious systems are “inherently contradictory.” Although others such as Erich Fromm and Orval Mowrer address Calvinism’s indoctrination of people with guilt, according to Rotenberg (1975, p. 59), they do not address how the congregant’s internalization of Protestantism was “helped and changed by a therapist who is affected by the same doctrine.” Fine (1983, p. 245) goes so far as to argue that Weber’s very term of “Protestant Ethic” has become constitutive of sociological analysis, and despite Weber’s critics it continues to be a “potent force in the psychology the average individual.” According to Fine (1983, p. 246), Weber offered a psychological model by means of economic

terminology because psychology had not adequately matured during Weber's lifetime. Fine (1983, p. 257) believes that Weber sought to explain how a "healthy balance between ego and libido" could engender a "gratifying work life," but this requires a "genetic reconstruction" that Weber referred to as an "ideal type" that provides a useful marker for the "obviously pathological."

More recently, Lough (2006, p. 38) has argued that Weber detected how both the "spirit" of capitalism and capitalism itself created "social and historical conditions" as a necessary foundation for Weber's "methodological isolation" of "spirit" from the numerous other historically situated individual subjects available as objects for research. Weber thus viewed capitalism as a "precondition for his own research." Lough (2006, pp. 55–56) points out that only Weber and Kant understood how "violence, hostility and terror" aimed at the body play a key role in "religious subjectivity and practice" and thus constitute an "indispensable feature of the sublime" that serves as an effective "prolegomena on the prodigious hostility towards the body to which we have grown accustomed under capitalism." Mather (2005, p. 1) argues that Weber's very use of the term *Antriebe* makes interpretation of the text difficult because Weber never adequately defines the psychological implications of the term. While Mather's hyperbolic claims that this shortcoming renders interpretation of Weber's text "impossible," the historical moment in which Weber used the term *Antriebe* does complicate its very use as psychology had not fully matured as its own discourse: Mather (2005, p. 2) points out that Weber's "silence on the mode of subjectivity" highlights the "paucity and underdeveloped nature" of psychological discourse. Mather (2005, p. 15) criticizes Weber's assumption that intellectual "maxims" point to "purposive and cognitive behavior" as the "outcome of rationalization processes associated with psychological drives."

Very recent critical response has explored the critical complexities and ambiguities in Weber's text. Kim et al. (2013, p. 639), for instance, believe that Weber knew that human psychology does not necessarily adhere to "strictly behaviorist, 'rational,' or logical principles" because he

understood culture's role in forming subjectivity in an occasionally "scary and unknowable world." Spagnolo (2015, p. 219) labels Weber's articulation of the Protestant Ethic as merely "one of the possible forms of heresy" justifying a moral and/or punitive understanding of capital. Spagnolo (2015, p. 219) also argues that Weber's concept of *Geist* comes alongside the "individual predisposition of the subjects who accept the modes of action of this ordering spirit that gives an ethical/psychological boost to men endowed with charisma or with particular energy."

Weber's *Protestant Ethic* appeared during the ascent of Sigmund Freud's groundbreaking career and thus occupies a unique place in the history of sociological thought. Although he did not have at his disposal, a fully articulated system of Freudian psychoanalysis, his *Protestant Ethic* foreshadowed Frankfurt School Freudo-Marxism, the poststructuralism of Michel Foucault, and even the Marxist-Lacanian cultural analysis of Slavoj Žižek. Protestant theological debate ended long before Weber's time, and Christian theological debate has similarly settled into comfortable, calm, and collected discourse. But Weber's *Protestant Ethic* nevertheless remains an important sociological text that simultaneously engages with religion and psychology in an attempt to understand the watershed moment in the most dominant religious system in the Western world.

May, Rollo

Ronald Baard
Bangor Theological Seminary, Portland, ME,
USA

Rollo May is considered the grandfather of the Existential School of counseling and psychotherapy, which builds upon the classic psychoanalytic movement – a movement he both appreciated and critiqued. He was born in 1909 in Ohio and died in 1994 in northern California. May studied at Oberlin College and served as a high school teacher in Greece for a few years before attending Union Theological Seminary. After graduating from Union, he practiced for 2 years as an ordained minister at the First Congregational Church in Verona, New Jersey, after which he dedicated himself to doctoral studies at Columbia University where he earned his Ph.D. in clinical psychology.

Rollo May was a good friend of the Christian theologian and mystic Paul Tillich, whom May met in 1933 while he was a student at Union. Tillich was also a strong intellectual mentor for May. Later in his life May wrote a memoir of their

friendship that was published shortly after Tillich's death.

The foundations of his approach to an existential school of psychotherapy were deeply influenced by his understanding of the interrelationship of three seminal European intellectuals – Sigmund Freud, Søren Kierkegaard, and Friedrich Nietzsche. May's approach moved away from the medical model of the psychoanalytic school to a more deeply philosophical and theological model. The essential key to understanding the human condition, for May, is the concept of anxiety, which was the topic of his doctoral dissertation.

In an existential approach, with basic anxiety as a given, the person seeking help is encouraged toward her or his unique expression of creativity in life as a way of responding to the challenge of anxiety. He wrote "If you do not express your own original ideas, if you do not listen to your own being, you will have betrayed yourself" (May 1975, p. 12). For May, the focus on creativity kept therapy grounded in the categories of being and becoming, as he consistently argued for an existential and ontological basis for deep healing.

In the last years of his life, May was concerned about the development of a wide plethora of schools of psychotherapy, which he found unhelpful both to the culture at large and to the healing arts. He felt strongly that the discipline of psychotherapy should maintain its grounding in the fundamental purpose of "making the unconscious conscious." He also felt a deep concern for youth growing up in contemporary Western culture, lamenting on their behalf the loss of a sense of deep mystery and, with that, a subsequent loss of hope.

Maya

Amitabh Vikram Dwivedi
College of Humanities and Social Sciences –
Languages and Literature, Shri Mata Vaishno
Devi University, Katra, India

Introduction

The word “Maya” is very much a part of Hindi speakers’ active vocabulary. In day-to-day conversation, Hindus quite often use the Hindi phrase, *sab moh-Maya he* “worldly attachments bring enticement,” so much so that it has now become a cliché. The connotative meaning of this phrase is similar to the idea reflected in the Wordsworthian sonnet “The World Is Too Much with Us.” But we find a deeper meaning and interpretation of “Maya” in Hinduism. The Indian spiritual tradition informs us that the world is “Maya” (translated as “unreality” or “illusion” in English), and the Hindu scriptures lay emphasis on meditation and yoga as the effective means of moving beyond Maya. We can say that everything that is the part of this world is actually “Maya,” and when we come across with various constructs of the world, they function as doorways to a deeper reality. Whether we want to open the door or not, it depends upon the individual’s conscious decision, and only a few succeed in opening these doors and walk through it to the other side. When every object or being is a door, the situation is no better than a Derridan textual labyrinth, when he says that a text is a text of another text (Oregonstate.edu 2019). This entry

will discuss the Hindu concept of “Maya” in connection with psychology and religion.

Discussion

The idea that the worldly constructs are illusion is associated with the nondualist philosophical School, known as the Hindu Advaita Vedanta. Sankara, the most influential philosopher of this School, stated three statements: “The universe is unreal. Brahman is real. The universe is Brahman” (Psychology Today n.d.). Mostly, the followers of Hinduism fall trap of misreading – they take into account only the first and second statement which indicates a duality between the world and spirit. While rereading in context with the third statement, the situation becomes clear, and the meaning conveys that the universe does not have an independent reality. So, the world in itself is neither real nor unreal, but actually it depends upon our perception. Mostly, people are in the habit of seeing separate objects according to their physical appearances, and they fail to notice an underlying spirit unifying them. The psychological aspect of habit tells us that it is “a more or less fixed way of thinking, willing, or feeling acquired through previous repetition of a mental experience”(Oregonstate.edu 2019).

This habit of seeing objects separately creates a situation as if we were living in a dream within a dream, because our perception is faulty and based on delusion. The Hindu scriptures claim that through meditation and yoga, a practitioner can move beyond “Maya” and can see that the universe is inseparable from the spirit. Not only that, it is also a manifestation of spirit. Also, Walt Whitman writes in “I Sing the Body Electric” that the body is infused with spirit so much so that it is in union with the spirit (Psychology Today n.d.).

But this realization is easier said than done. Many ignorant people who consider “Maya” as illusion in a literal sense quite often take spirituality as an excuse of problems faced in the real world. They remain indifferent to the bitter realities of the world, such as poverty, starvation, warfare,

ecological catastrophe, fight for social causes and terrorism, and alike. Such people remain in the Hamlet like state of inactivity and inaction which is also a perpetual state of postponement. Indirectly, through their inactivity, they cause a great loss to both Hinduism and humanity.

In Hinduism, we find an elaborate discussion on “Maya.” It is believed that *karma* “action” and *ahamkar* “ego-consciousness” are the binding forces of Maya. If one wants to attain *moksha* “liberation from the endless journey of rebirth and death,” one must see through what is beyond ‘Maya’. This ‘seeing through’ is actually a result of a psychological state of mind, known as wakefulness. In wakefulness, we realize that “Maya” is a lesser reality, whereas Brahman is the ultimate reality (Psychology Today n.d.). “Maya” is also visualized as a *devi* “divine mother” and also referred to as *mahamaya* “great Maya” who covers Vishnu’s eyes (one of the trinity in Hinduism) when he remains in *yoganidra* “divine sleep” during the cycles of existence when everything in the universe is resolved into one, also known as *pralaya kal* “time when creation is destroyed” (Maya (illusion) n.d.).

Meaning of Human Existence

Todd DuBose

The Chicago School of Professional Psychology,
Chicago, IL, USA

The question of the meaning of human existence holds the longest running place on the best seller list of vital questions among human beings, and the plethora of answers to this question have been complementary, redundant, and contradictory and expressed in philosophical arguments, theological apologetics, literary narratives, and a myriad of expressive arts. The meaning of human existence, though, is found by exploring situations in which, as Joseph Campbell (1904–1987) was apt to say, one is experiencing oneself as alive in meaningful and fulfilling ways. The experience of being alive in meaningful and fulfilling ways, however, is still described in nearly as many diverse ways as there are those asking the question, which is as it should be.

Descriptions of meaningful and fulfilling kinds of existence are plentiful in the history of philosophy and religion. These descriptions include notions of Platonic attainment of the ideal good to Aristotelian practices of the virtuous life, from Epicurean achievement of pleasurable absence from pain and suffering to Stoic self-control, indifference, and freedom from obsession and compulsion or the Cynic’s self-sufficiency and release from external attractions and controls. For the pragmatist, the meaningful life is one lived with utility and practicality, while the utilitarian finds meaning in life by submitting to the higher spiritual goal of all actions being done with the intention of achieving the greatest good for the greatest number of people. The existentialist seeks freedom and the transcendent experience of creating one’s meaning in life, while the humanist seeks the actualization of one’s potential, even to the transhumanist’s desire for overcoming all limitation, even death. Logical positivistic meaning is found in objective, empirical verification. The

Abrahamic religions find meaning in pleasing and loving the divine, while the Eastern religious traditions include Confucian emphasis on social education and proper relationships, Taoist alignment with the flow of nature, Shinto movement toward collaboration with nature spirits in the path toward immanent immortality, Buddhist awakening from suffering, Hindu liberation from cycles of repetition through alignment of one's soul with the supreme soul, Bahai's spiritual unity of all humankind, to Zoroastrian rewards in blissful life for right actions, and avoidance of the hellish life for destructive living.

The history of discovering meaning in existence is not without the challenge of absurdity, meaninglessness, and despair. More formally expressed in the nineteenth century and early twentieth century, and resurrected more explicitly in postmodernity, nihilism in various forms attempts to deconstruct any conception of transcendent meaning, and most importantly, any meaning deemed static, secure, or eternal. Whether it is a Nietzschean devaluation of all values (Nietzsche 1967), or Heidegger's destruction of metaphysics (Heidegger 1962), or the reduction of value to merely exchange value, or the relativism of linguistic meaning, one is left often with the lived experience of meaninglessness and despair. Yet, the very diversity of meaningful experiences articulated and expressed in history need not nullify the experience of meaning making as central to human well-being. On the contrary, the diversity of searches and experiences for meaning validates its significance. Sounding somewhat circular, the meaningfulness of the search and expression of meaning in human existence gains its reliability and validity from its inescapable and unavoidable presence across all qualifications of diversity in history, culture, and life span.

Meaning making in psychology finds its most formal handling in depth psychologies of various sorts, including psychoanalysis, Jungian analytic psychology, and a range of existential-phenomenological perspectives. Kegan (1982) has described the process of developmental psychology as a series of meaning-making stages. The most familiar of the approaches to meaning

making is Viktor Frankl's (1905–1997) perspective on meaning in human existence called, logotherapy, as formulated by Frankl under the extreme duress of enduring and surviving a concentration camp (1946/1959). Other explorations of meaning making in psychology would include personal construct theory (Kelly 1963) and positive psychology (Seligman 2004) – the latter finding significance in discerning what is satisfying to others.

Commentary

The aforementioned compressed history offers vital themes or questions for further reflection. Is meaning created or found? Is meaning cognitively constructed or existentially lived out? Is meaning found in the absence of suffering, or does meaning arise from the edifying encounters with suffering, conflict, and pain? Is meaning a product of one's neurophysiology? Is it evoked by intimate relationships or the desire for them? Is it found in cultural discourse, symbols, or artifacts? Commentary on a few vital points of consideration may provide answers to these questions.

The experience and hope for freedom is central to most any description of a meaningful and fulfilling life, even though different types of freedom are meaningful to different persons: freedom from suffering and political oppression; from oppressive values; from a cycle of rebirth; from one's bodily existence; from disintegration, alienation, and dualism; from violence; from hegemony of ideas and practices; from illusion; or from limits of any sort. But our desires for freedom from situations are accompanied by desires of freedom toward other possibilities: toward a freedom to act, to connect, to decide, to eternal life, to purity, to intimacy, to justice, to synchronicity with nature, to a peaceful existence, to overcome evil, to authenticity, to productivity, to actualize one's potential, to truth, to satisfaction, and to union with the divine.

Our desire for freedom in its kaleidoscopic manifestations reinforces the conviction that transcendence is at the heart of meaning making. The experience of transcendence is the *sine qua non*

phenomenon that weds psychology and religion and is the existential life force operative in the formation of *homo religiosus*. Transcendence as freedom, if experienced in the here-and-now mode of existence, is an immanent experience of actualizing possibilities within one's ways of being in the world. Even for those who seek freedom beyond the world, this otherworldliness is existentially experienced at any given moment in this world's modes of existence and finds pathways and expressions of transcendence in our everydayness.

The cultural expressions of meaning and transcendence in and through cultural artifacts suggest meaning is embedded in the world's webs of significance. In this way, meaning is discovered in an already and always preestablished context in which we find ourselves. Webs of meaning differ given particular multicultural contexts, including economic contexts. For instance, in a capitalist economic system, profit bestows meaning, as does promotion, and other such experiences of ascendancy, in what could be considered a "commodified" experience of existence. In other contexts, the giving of gifts without expectations of remuneration or return or payback is shaped by what is considered a "gifting" kind of meaningful and fulfilling existence. Conflicts about what is meaningful among individuals are inevitable within and among cultures.

Relational patterns also construct space in which meaning occurs, such as in egalitarian and inclusive communal encounters that offer transcendence from hierarchical oppression and ostracization. For others, though, freedom from sharing, belonging, and difference has led to more exclusive and hierarchical patterns of relating, that although oppressive for most individuals, is nonetheless meaningful to those in power. Transcendence in this latter situation may be skewed in that freedom is a freedom to control others. But inviting other possibilities of communal liberation freed from commodification and paternalization as prime bestowers of significance ultimately requires starting from an understanding of the significance of control and destruction for those who exact these patterns of being. Inevitably, conflicts of competing contingencies occur

between competing enactments of significance, though resolution of conflict is facilitated more readily when mutual, empathic understanding is risked regarding how the other comes to find his or her respective life patterns meaningful is granted a hearing.

Another point to consider and clarify is that meaning making is more than cognitive formulations of propositions created by the neocortex. Hence, meaning making in existential psychology is often confused with schema formation in the cognitive sciences. Clarifying this distinction is vital. Neuropsychological insights offer us brain mapping of those undergoing experiences of significance, which makes us aware of how embodied meaning making is, but this process extends beyond the activity of the frontal lobe to other emotional and narrative centers of brain functioning. Helpful as this information may be, it would be a mistake to conclude that the brain "causes" meaning. Critiques of unilinear causality and biological determinism take us beyond the scope of this entry but suffice it to note that even within neurophysiology, we know that dendritic branching rewires itself in relation to significant experiences in our lives, particularly traumatic ones. Significant experiences are experiences in which we have attributed or found meaning in one way or another that can "cause" dendritic rewiring as much as be "caused" by it. It would be more appropriate to speak of our bodying forth in meaningful, transcendent possibilities as co-constructed and pre-reflective. Maurice Merleau-Ponty (1908–1961), the French existential-phenomenologist, brought our attention to how meanings are pre-reflective and lived out long before being conceptualized, which corroborates the neuropsychological findings mentioned above (Merleau-Ponty 1964).

The plurality of transcendent possibilities in meaningful and fulfilling modes of existence still leaves us with the specter of nihilism. If everything is meaningful, then can anything be meaningful? The counterquestion is just as fair and perhaps more accurate in its presumptions about existence: If everything is meaningful, how could anything be truly meaningless? It is a mistake to assume meaning making can be avoided or

escaped in existence. Even the apparent absence of meaning is always juxtaposed against an already and always posited presence of meaning. Despair would not be painful were it not for alternative enactments of significance in other desired lifeworld compartments that are absent, lost, or inaccessible for the one in despair. Even in “the pit,” despair discloses its own embedded hope for transcendence. In fact, we enact significance every moment of our lives.

Mecca

Susan Love Brown

Department of Anthropology, Florida Atlantic University, Boca Raton, FL, USA

Mecca is a city in western Saudi Arabia significant because it was the birthplace and home of the Prophet of Islam, Muhammad. The city was long an important locus of trade in the Middle East because it lays at the crossroads of trading caravans traveling throughout the region. Because of its association with Muhammad, it became a sacred space for Muslims and the object of a religion-mandated pilgrimage, occurring once a year. Mecca provides both a continuing association with the founder of Islam for its members and a connection with others who follow the same faith, which results in the reaffirmation of identity and a sense of communal affiliation.

According to Watt, “Mecca, Muhammad’s home for half a century was entirely a commercial city, set amidst the barren rocks. The growth of the city as a trading centre came about through

the existence there of a haram or sanctuary area, to which men could come without fear of molestation. Geographical conditions were also in its favour; it stood at the cross-roads of routes from the Yemen to Syria and from Abyssinia to Iraq. To Mecca, therefore, the nomad came for goods brought from the four points of the compass by caravans” (Watt 1960, pp. 2–3). Mecca is part of a sacred area (the Hijaz) in western Saudi Arabia. Mecca is 45 miles from the Red Sea.

Before the rise of Islam, the inhabitants of Mecca engaged in animistic and polytheistic religions. Mecca had a history as the location of a religious cult and home to the Ka’ba, a shrine that predated Muhammad and Islam. It was also a place of pilgrimage before the founding of Islam (Brockopp 2010; Rubin 2010; Saleh 2010; Watt 1960). The pre-existing religious tradition made it easier for future followers of Islam to affiliate with native spiritual traditions, providing some spiritual continuity. When Muhammed returned to Mecca in 622 CE, he incorporated these elements into Islam and reconnected it with the myths of Adam and Eve and Abraham, Hagar, and Ismael. Psychologically and culturally, this established the legitimacy of Islam by connecting it to these important personages and by establishing historical continuity for its followers.

Mecca and Muhammad

The Prophet Muhammad (570–632 CE) was born and raised in the city of Mecca, and the course of his life became a key factor in the practice of Islam. Born the son of Abd Allah and Amina, he is thought by some to be the descendant of a prominent clan. As an adult, he worked at organizing caravans, eventually marrying a rich woman, Khadija bint Khuwaylid b. Asad (Watt 1960, p. 38). They had seven children (four girls and three boys, all but one of which predeceased Muhammad) and to all intents and purposes lived a normal life (Brockopp 2010; Saleh 2010; Watt 1960). But it was not until he reached the age of 40 that he received an understanding of his religious mission and began to receive revelations from Allah, a deity that also predated

Muhammad and the founding of Islam (Rubin 2010; Saleh 2010).

Perhaps it was the natural inaccessibility of the area by either the Byzantine or Sassanid empires that allowed Muhammad’s teachings to flourish (Saleh 2010, p. 21). Muhammad saw himself as returning to the religion of Abraham. His first revelation in a cave in the mountains beyond Mecca was attended to by the Angel Gabriel, and it was in Mecca that Muhammed received the Qur’an (Saleh 2010, pp. 34–35).

The people of Mecca did not take kindly to Muhammad’s revelations and new religious teachings or especially to the fact that he was pushing for monotheism in a society that did not want to give up its multiple deities (Saleh 2010, pp. 36–27). Ultimately, they rejected Muhammad and his teachings (Rubin 2010, p. 39). Muhammad left Mecca with his followers in 622 CE and settled in Medina. This break with Mecca marked the beginning of the Islamic calendar. In spite of having left, Muhammad had continual interactions with Meccans, often in the form of battles. Eventually, he secured the right of his followers to return to Mecca on pilgrimage. In 624 CE, Muhammad changed the direction of prayer from Jerusalem to Mecca (Porter 2012, pp. 14–15).

When Muhammed returned to Mecca, he incorporated elements from the older spiritualities into Islam and reconnected it with the myths of Adam and Eve and Abraham, Hagar, and Ismael. Psychologically and culturally, this established the legitimacy of Islam by connecting it to these important personages and by establishing historical continuity for his followers.

In 630, 2 years before his death, Muhammad destroyed pagan idols and struck down the important idol of Huba from the top of the Ka’ba, effectively making the city his own (Watt 1960; Wheeler 2006). Afterward, he consolidated the old and the new, making Mecca the sacred center of Islam and Allah its only god, maintaining the Ka’ba and its sacred stone. He envisioned his acts as spiritual reform, which returned the people to the myths of Adam and Eve that predated Islam and to the lives of Hagar and Ismael, said to be buried within the Great Mosque. In 632 CE, Muhammad performed a hajj, known as his

“Farewell Pilgrimage,” and this became the model for all future pilgrimages from then until now (Porter 2012).

Mecca, Liminality, Communitas, and Sacred Space

Because every Muslim is required to make the pilgrimage to Mecca at least once in a lifetime, the city has maintained its sacred character for more than a thousand years. The Hajj occurs annually between the 8th and 13th days of Dhu al-Hijjah, the twelfth month of the Islamic lunar calendar. The pilgrimage joins sacred space to sacred time, and this starts at the beginning of their journey to Mecca and ends in the state of *liminality* that occurs during the events in Mecca. “Liminality is usually a sacred condition protected against secularity by taboos and in turn prevented by them from disrupting secular order, since liminality is a movement between fixed points and is essentially ambiguous, unsettled, and unsettling,” according to Victor Turner (1974, pp. 173–174).

The Hajj, like all pilgrimages, places the individual within that transitional state that represents the space between identities and in which occurs *communitas* – the breaking down of the barriers between people, effected by the common mission of walking in the footsteps of the Prophet, chanting prayers, wearing white clothes, and sharing common experience (Turner 1969/2017, 1974). “In liminality, *communitas* tends to characterize relationships between those jointly undergoing ritual transition. The bonds of *communitas* are anti-structural in the sense that they are undifferentiated, equalitarian, direct, extant, nonrational, existential, I-Thou . . . relationships. *Communitas* is spontaneous, immediate, concrete – it is not shaped by norms, it is not institutionalized, it is not abstract” (Turner 1974, p. 174). In carrying out the rituals of the Hajj, the pilgrims achieve that sense of community that binds them to Muslims all over the world.

But simply being in Mecca and being admitted to its most sacred mosque focuses the participants on their identities as Muslims. Mecca is a place of both transformation and reaffirmation of identity,

as well as an occasion for the intensification of the experience of transcendence that seems to be at the heart of all spirituality. A sacred place provides the environment in which a number of things can happen psychically: first, identification with the Prophet and his experience, both the initial experience in which the origin of Islam occurred and the final experience of Muhammad in the hajj and, second, there is the transformation of the self through ritual – the separation from the everyday world of the profane/secular, the entry into the liminal space in which one’s previous identity disappears as one completes each part of the prescribed ritual, and the reemergence into the world as one who has completed the most important obligation of one’s faith.

In spite of the many disruptions in the existence of Mecca as a sacred Muslim space, it has remained central to Islam and to Muslims generally. It has endured theft, attack, disease, and death, but it continues to be the center of Islamic life the world over. Mecca provides both the means of reaffirming the commitment to Muhammad and his teachings and allows Muslims from around the globe to connect and achieve a *communitas* that reinforces their faith and commitment. They, in essence, follow in the footsteps of Muhammad while fulfilling a spiritual requirement and reaffirming their ties to something beyond themselves.

Because of the way it functions in the life of Muhammad, the prophet and founder of Islam, Mecca is a symbol of the sacred experiences that occurred there and which can be emulated by Muslims themselves psychically and physically, constituting the experience of the unique union of the body and soul.

Meditation

Trish O'Sullivan
Kwan Um School of Zen, Psychotherapy,
New York, NY, USA

Meditation is a practice wherein active thinking is suspended and mind activity is focused and stilled. There are three meditation subtypes – concentration, contemplation, and mindfulness. Concentration involves focusing the mind on one object, contemplation involves the summoning of an image or thought and then holding or examining it in the mind, and mindfulness is paying complete attention to the here and now including thoughts and feelings without engaging with them. In actuality, these practices are often intermingled. Some religious groups, however, emphasize one or the other, e.g., concentration in Zen meditation, mindfulness in Vipassana or insight meditation, and contemplation in Christian and Tantric meditation.

Meditation Techniques

Meditation is generally concerned with calming and controlling the mind. There are various techniques for achieving this:

1. Mantra – focusing the mind on a thought, word(s), or sound.
2. Breath – focusing the mind on the breath as it enters and leaves the body (Anapanasati).
3. Image – a spiritual image is focused on in the mind's eye.
4. Guided – a theme or structured map is followed.
5. Mindfulness – observing thoughts and feelings that arise (Vipassana).

Meditation Postures

The most common meditation posture is sitting cross-legged on a cushion with the hands forming a mudra in the lap or on the knees. However, there are various forms of sitting postures, including sitting in a chair. Sitting without moving allows the mind to concentrate fully. Other forms of meditation postures are standing, bowing, or walking. Meditation can be continued throughout daily activities through the practice of mantra repetition or mindfulness – present awareness.

Spiritual or Religious Meditation

There are differences between the emphasis, approach, and techniques used by various religious traditions. Sometimes the meditation practices are utilized by mystics only or otherwise hidden, while some religions consider meditation to be a central practice for all adherents. Goals of meditation practices also vary, and they include contact with the divine, spiritual insight, self-refinement, self-knowledge, purification of consciousness, and/or enlightenment. The practice itself is done within each unique religious framework and has that religion's particular emphasis as well as flavor or imprint.

Buddhism

The Buddha attained nirvana or enlightenment by meditating. He then devised the Noble Eightfold Path out of suffering of which correct meditation (concentration or dhyana in Sanskrit) is the eighth practice on this path and mindfulness the seventh. Buddhists strive to purify the heart and mind of greed, hatred, ignorance, fear, envy, jealousy, and other attributes of mind that produce suffering as well as to achieve enlightenment by realizing their own true or Buddha nature.

Although the goals are similar, the practice methods within the major Buddhist traditions differ in emphasis and sometimes overlap. There are three main groupings within the Buddhist meditation tradition:

Zen – emphasis on concentration through the practice of zazen or sitting meditation. The word *Zen* is a Japanese term which comes from the Chinese ch'an which is a transliteration of the Sanskrit term dhyana or meditative absorption.

Vipassana or insight (Theravada) – the practice of mindfulness and analysis of phenomena to facilitate inquiry into the true nature of things.

Tantric or Tibetan – in addition to concentration and Vipassana, the distinctive practices of this branch often include visualization and contemplation of mandalas, deities, etc.

All three of these traditions include metta or loving kindness practices although in different forms, i.e., chanting in Zen, and visualization in Vipassana and Tibetan.

Christianity

Meditation has not been a central spiritual activity for ordinary people within Christianity where the emphasis is more on prayer, although some of the prayers chanted over and over again silently with the aid of rosary beads are like mantras which concentrate the mind. Religious and mystics have and do practice both concentrative and contemplative forms of meditation. The presence of God is the object of Christian contemplation. There is also the objective of becoming more holy or Christlike. In the Eastern Orthodox tradition, there is a practice known as repetition of the "Jesus Prayer." "Lord Jesus Christ, Son of God, have mercy on me." This is similar to a mantra

used in the concentrative practices. St. John of the Cross taught silent, imageless meditations not unlike Zen meditation. Similar to Sufism, the basis of Christian meditation is to open one's heart to both human and divine love. In current times, there has been cross-fertilization from East to West, and many Christian meditation practices now incorporate Eastern techniques while maintaining the unique Christian perspective.

Hinduism

Most Eastern meditation practices have their roots in ancient India. A classical meditation technique of ancient India is pranava or the repetition of the sacred sound of *om*. Yoga and Vedanta are the two prominent philosophies of the Indian tradition. With both, the goal of meditation is to lose the subject/object distinction and realize the truth of ultimate reality. Meditation is the only way to achieve this goal of Samadhi or blissful super-consciousness. Patanjali (second–third century CE) is clear in his Yoga Sutras [1.2] that the purpose of Yoga is stilling the mind or "restricting the whirls of consciousness" – "*Yogas citta vritti nirodha*." With Vedanta, meditation is seen as purifying the mind through intense mental worship, and the goal is union of the individual consciousness with the all-pervading consciousness. This worship entails symbols and images, repetition of a sacred word (*japa*), meditation on the qualities of the divine, and meditation on oneness with the divine. In Tantric Yoga, yantras (geometric designs representing universal forms) are internalized through intense concentration and visualization.

Islam

Sufism, considered the mystical form of Islam, incorporates meditation practice. In Sufism, meditation and contemplation are considered essential for purification of the heart. Remembrance of God is the primary focus. There are many forms of meditation/contemplation including breath control, visualization, chanting the names of God, recollecting verses of the Koran, and the use of a *zikr* or phrase concentrating on God chanted either silently or out loud. There is also a mindfulness practice wherein one contemplates the self:

analyzing weaknesses and negative qualities with the intention of purging them. Freeing oneself from the illusion of separation from nature and the universe by the suspension of rational thinking in meditation is also a focus.

Judaism

Jewish meditations come from the tradition of Jewish understanding and include Jewish symbols, words, images, and visualization practices. Regardless of the approach, the focus and aim of Jewish meditation is the union of the self with the divine. While some form of Jewish meditation is believed to have existed in ancient times, over time, meditative techniques became largely confined to esoteric Kabbalah practices. Beginning in the eighteenth century, the Hasidic movement attempted to bring meditation into the lives of ordinary Jews. They taught prayer as mantra and contemplative forms of meditation aimed at refining character traits and awareness of the divine. This practice consisted mainly of focusing on the letters of the divine name in various combinations: the Tree of Life symbol, a candle flame, or chants. Jewish meditation is today making a comeback based on recorded practices from historical Jewish texts including Kabbalah and meditation practices created by Jewish meditation teachers or borrowed from Eastern traditions.

Taoism

Taoists believe that mind and body are intimately connected to one another. Therefore, in Taoism, meditation is both for improving and for maintaining the health of the body and attaining enlightenment. The focus is on stilling the mind and attaining present awareness by keeping the mind and breath together. This helps to simplify life and increase awareness of path. There are many “inner alchemical” practices as well as physical practices such as Tai Chi, for balancing the Yin and Yang energies and the five elements.

Secular Meditation

Within secular society, meditation is sometimes used for self-improvement purposes. This type of

meditation is without spiritual goals and is utilized more to obtain good feelings, to improve concentration and performance in some activity, to help solve emotional or mental problems, or to relieve physical and mental stress.

Meditation is said to have physiologic benefits. It helps slow down the impulse to rush into the next moment, and since much stress is caused by anticipation, it reduces stress and promotes a relaxed state which improves focus and promotes inner calm. Many studies have reported that brain rhythms, heartbeat, blood pressure, skin resistance, etc., are changed by meditation with resultant health benefits. There are ongoing studies on the beneficial effects of meditation and mindfulness to the mind and body.

Meditation and Psychotherapy

The goals of both psychotherapy and spiritual meditation are to decrease suffering and increase happiness. They differ in that many types of psychotherapy aim to strengthen the ego and the self with the goal of improving the client's personal and social functionality while meditation aims to free the individual from identification with the ego for the purpose of increasing awareness of the self as part of a whole and attaining spiritual realization. They are similar in that with both disciplines, the focus is on exploring consciousness both within the self and between the self and the other. With both, the habits of mind are observed with the intention of letting go of illusion, unhappiness, suffering, and self-alienation. Meditation is a letting-go practice and helps clients to see where they are holding onto opinions and views, let go, and gain a wider perspective.

Knowledgeable therapists often teach their clients meditation techniques for use outside of the office since the meditation process is an individual internal experience. One of the benefits of meditation for both therapists and clients is the improvement of concentration and mindfulness or the ability to be fully present in the here and now of the psychotherapy session. Mindfulness of both the self and each other is an important aid to

the therapeutic process for both the client and therapist.

Self-refinement and personality transformation through meditation are goals in many religious traditions, but Buddhism and Yoga both especially emphasize psychology. In both Buddhist and Yoga psychology, freeing oneself from the grip of attachments is central to personal growth and development. Both traditions hold that past thoughts form impressions or *samskaras* (skrt) which form habitual patterns of thinking and behavior. Through concentrating the mind in meditation, the unconscious can be penetrated and the *samskaras* loosened, observed, and eventually dissipated. The Sufis through a similar process tap into unconscious forces and become aware of and transcend the egoistic *nafses*.

The use of meditation techniques within the therapy or advocacy of meditation for clients should be carefully considered. Many teachers do not advocate meditation for those who are emotionally or psychologically unstable as both the detachment process and the surfacing of intense emotions can be overwhelming for unstable patients. There is also a phenomenon known as “meditation sickness” wherein headaches, chest pain, or stomach aches may occur when the beginner practices excessively. This is believed to result from chi or kundalini energy rising too fast.

On the other hand, meditation is said to help patients with objectivity which can increase emotional stability. This skill in observing emotions rather than acting upon them helps to counter-impulsive behavior. Self-detachment rests and rejuvenates the mind. Mindfulness practices are sometimes used in psychotherapy to increase the patient’s awareness of their inner state. Dialectical behavior therapy, for example, teaches unstable clients mindfulness skills in order to increase their capacity for staying in the moment, sitting still with afflictive emotions and balancing the mind. The taking apart of self-concepts in mindfulness meditation allows clients to increase self-knowledge and correct misidentifications with negative aspects of their personalities. One can train oneself to identify and then relinquish painful mental habits. Meditation is also believed to

increase compassion towards others, thus, improving relationships.

Currently in the West, there is an increasing interest in the integration of meditation, specifically Buddhist meditation practices, and psychotherapy.

Meister Eckhart

Marta Green
New York, NY, USA
Mercury Pier Publishing, Hong Kong Special
Administrative Region of the People's Republic
of China, North Point, Hong Kong

Life

Johannes Eckhart (also called Eckhart von Hochheim, also spelled Ekehart) was born around 1260 in Thuringia in what is now Germany. He entered the Dominican priory around 1275. He studied in the University of Paris, receiving his master's degree in 1302 and the title of Meister meaning Master. In his lifetime, he became famous as an administrator, scholar, preacher, and spiritual director. In 1323, the Archbishop of Cologne inaugurated proceeding against him for heresy. After publicly declaring that he had no intent to preach heresy, Eckhart

appealed to Pope John XXII but died some time before he was to appear before the Pope in April of 1328. In 1329, the Pope issues a bull condemning 28 of Eckhart's propositions (Smith 1987, pp. 6–8).

Thought

Meister Eckhart was most concerned with the *union* of the soul to God. Of the birth of the Word in the soul, he writes, "What does it avail me if this birth take place unceasingly and yet does not take place within myself?" (Eckhart 1980, pp. 293–312).

Eckhart is concerned with knowing God, but for him, knowledge is in the form of union with God. You know about something by joining with it, the way Adam knew Eve. Knowing God cannot be achieved in the outer world but only by turning inward and experiencing God in the "*Foundation of the Soul*." Eckhart conceived the Foundation of the Soul as a place of pure emptiness and receptivity, unformed, unconditioned. Being that humans are made in the image of God, God also has a *Foundation*, a place Eckhart calls "the desert," "the abyss," where God is also purely empty. It is at the Foundation of the Godhead that the Foundation of the Soul finds union with God.

To achieve this place of union, individuals must practice *detachment*. We must detach not only from material possessions, relationships, and our sense of who we are as individuals but even our means of experiencing reality: memory, reason, images, sensations, and perception. We are to become empty, sounding boards for God (Smith 1987, p. 64). Eckhart writes: "Avoid the restlessness of external deeds! Flee and hide yourself before the storm of inner thoughts, for they create a lack of peace! If God therefore is to speak the Word within the soul, the soul must be in peace and at rest" (Fox 1980, p. 298).

When one has completely emptied oneself, then one can receive God (the Word) completely without reservation or thought and "*Breakthrough into the Godhead*." Breaking through means that God completely lives in the person so that the life

of God becomes the person's life. "The eye with which I see God is the same with which God sees me. My eye and God's eye, and one sight, and one knowledge, and one love" (Fox 1980, pp. 83–86, Sermon IV). When we are united with God, we can see the world not as creatures, but as God does (Kelley 1977; Smith 1987, p. 65).

There is one more step. Eckhart understands that God does not reside only in God's Foundation but that God flows out into the world. God animates the world by breathing out into it and then withdraws His breath into the silence and emptiness of His solitude. In doing so, God enacts a never-ending eternal process of life and death (Smith 1987, p. 70). As we are united with God, we also flow out into the world and return back to union with God.

Relationship to Psychotherapy

Although Eckhart's concern is union with God, not the healing of souls, aspects of his thought can inform the practice of psychotherapy, especially if psychotherapy does not limit itself to symptom relief, but is concerned with the development of the inner world of the patient.

One place where the thought of Eckhart and modern psychotherapy meets is in the commitment to radical interiority. Eckhart's insistence on and detachment from all is not dissimilar to the sort of discipline required of those in psychoanalysis. The analysand is asked to examine the inner meaning of outward events; sometimes to such an extent that the events of one's "real life" became nothing more than a screen for one's projected inner contents. This is certainly a process of detachment from the "reality" of everyday life. All internal contents are examined for their unconscious symbolic value in a detached manner, and interpretations are offered. Eckhart would eschew interpretations and insist on a complete house cleaning, sweeping away all labels and preconceived concepts. Eckhart doesn't even want to label God as "good" for fear that the word would be too confining (Fox 1980, pp. 177–180, Sermon XII).

Meister Eckhart taught a radical presence to God by cultivating a mind completely clean of

preexisting categories. In this, his thought is very similar to that of the Eastern mystics. The concept of radical emptiness may be of help in the work of psychotherapy. To the extent that therapists are able to become aware of the contents and categories of their minds and detach from them, maintaining an evenly hovering attention, to that extent, they are able to be wholly present to their patients. As Eckhart warned about images, counselors must detach themselves from all images of who they are and of what therapy is and allow each session to come alive in the spontaneity of the moment.

Eckhart's concept of image is also helpful in considering the self-image of the patient or counselor. Patients are people who have become attached to a few very rigid ideas of who they are and what is possible for them: "I am not good enough." "I am no one unless I am loved." They block out much of life returning to their core images (Shainberg 1983, p. 11f). Clearly, such individuals can be helped by learning to let go of their grip on such limited life scripts. Much can be gained by honoring Eckhart's in-depth understanding of detachment from images especially in detaching from self-images in the service of freeing up inner space for the client. The images must be dissolved not to be replaced with other supposedly superior images, but to permanently free up the inner world of the client, enabling them to live spontaneous, less scripted lives.

While the therapist may detach in approaching the patient and in helping the patient let go of inner clutter, for Eckhart, detachment creates a space for God which he defines as the Word entering human life. To experience the Word, Eckhart counsels not knowing or as his seventeenth sermon is titled: "Letting the Intellect Go and Experiencing Pure Ignorance" (Fox 1980, p. 238). Is this not also a useful model for a therapist? Can we likewise practice entering each session without "desire, memory or understanding" as Bion has counseled to await the birth of the one word that needs to be said in that session? The one word that will define and heal and connect the moment. Is that not the point of the session to sit and wait for the one right word to emerge spontaneously, in the session, out of the communion of the unconscious?

Melancholia

Nathan Carlin

McGovern Center for Humanities and Ethics,
University of Texas Medical School, Houston,
TX, USA

Notes on the Term

The term “melancholia” comes from Greek and literally means “black bile.” The condition of melancholia in ancient times, according to the medical theory of the four humors, was thought to be caused by an excess of black bile in the human body. Since ancient times, there has been a great deal of writing on melancholia, including works by such thinkers as the Hippocratics, Rufus of Ephesus, Galen, and Avicenna, to cite only a few of the most prominent names (cf. Jackson 1986). While Robert Burton's (1979) *The Anatomy of Melancholy*, published in 1621, is generally regarded as the most extensive and detailed treatment of the term, Sigmund Freud's (1963) “Mourning and Melancholia,” published in

1917, is perhaps the work most well known on the issue of melancholia, likely because of Freud's enormous influence on western culture in general and because of his impact on the practice of psychiatry in America in the twentieth century in particular. In this essay, Freud gave a psychological or mental, as opposed to a biological, explanation for melancholia in that he argued that mourning and melancholia are two kinds of reactions to losing an object, where mourning represents the normal grieving process and melancholia a pathological response – and he gives psychodynamic explanations for both processes. In melancholia, Freud suggests that one is prevented from mourning because the object is “still in the neighborhood” but is still nevertheless lost, and Pauline Boss (1999), a contemporary therapist, refers to melancholia as “complicated grieving” but notes that complicated grieving can be completely normal in complicated situations involving ambiguous loss.

The term “melancholy” today is often associated with sadness (a feeling or mood) and depression (a clinical disorder or symptom). In clinical circles, the term melancholia has fallen out of favor, much like the terms manic-depression and sociopath. In *The Diagnostic and Statistical Manual of Mental Disorders-IV-TR*, for example, there is no melancholia diagnosis, but there is a subsection titled “Melancholic Features Specifier” that is used to help clarify diagnoses of mood disorders, such as bipolar I and II disorders. However, melancholia as a term is making a comeback. William Styron (1990) writes in his memoir that

“Depression,” most people know, used to be termed “melancholia,” a word which appears in English as early as the year 1303 and crops up more than once in Chaucer, who in his usage seemed to be aware of its pathological nuances. “Melancholia” would appear to be a far more apt and evocative word for the blacker forms of the disorder, but it was usurped by a noun with a bland tonality and lacking any magisterial presence, used indifferently to describe an economic decline or a rut in the ground, a true wimp of a word for such a major illness (pp. 36–37).

Donald Capps and I (Capps and Carlin 2007; cf. Capps 2005) have endorsed Styron's view in our own writings in the fields of pastoral psychology and psychology of religion. In psychiatric literature, Taylor and Fink (2006) have also

endorsed Styron's view, as they quoted this very passage for one of their chapter epigrams, and they argue that melancholia has a more precise meaning than depression in terms of clinical diagnosis (p. 15). In any case, time will tell what the status of melancholia will be in *The Diagnostic and Statistical Manual of Mental Disorders-V* and beyond.

Melancholia and Religion

Historically, melancholia has also had religious significance. Jackson (1986) notes that "Whether the gods, a god, or the God, the supernatural being (or beings) visited the distressing state on the sufferer as punishment for his sin or because of his lack of repentance for his sin" (p. 325). Jackson also notes variations on these themes, that sometimes, for example, it was and is still sometimes believed that God can use mental illness as a means for growth or that the Devil, too, may be allowed to test God's faithful from time to time, as in the *Book of Job*. Such explanations for melancholia will likely sound offensive to the contemporary reader because these explanations appear to be blaming the victim and/or rationalizing, trivializing, or romanticizing suffering.

In any case, mental and emotional disorders in general continue to have religious significance today. While psychological insights into religion have not fared well among theologians (cf. Scharfenberg 1988), Paul Tillich is certainly an exception, and his theological thinking does not blame the victim, nor does it rationalize, trivialize, or romanticize suffering. Tillich's project was to correlate the teachings of the church with modern day experience, and so he redefined many traditional theological concepts, like sin. He argued for understanding sin as estrangement from God, others, and self. And he also argued that everything in existence is in estrangement. Existence, in other words, is estrangement. The upshot here is that, for Tillich, it would be correct to say that mental illness is a manifestation of estrangement or sin, but it would not be correct to say that it is the result of a particular sin. Tillich

wrote regularly for the journal *Pastoral Psychology* in its early years, and he (2000) also wrote at length about the religious significance of anxiety and despair. In terms of the religious significance of melancholia today, particularly for men, Donald Capps, whose work I will discuss briefly below, has written prolifically (see, e.g., Capps 1997, 2001, 2002, 2004, 2005, 2007a, b), and the topics of mourning and/or melancholia have been written about a great deal by both psychologists of religion and pastoral theologians (see, e.g., Carlin 2010a, b; Cole 2008; Hamman 2005; Homans 1989; Parsons et al. 2008).

Jackson (1986) also notes Burton's introduction of the term "religious melancholy" in his *The Anatomy of Melancholy*. Burton defined religious melancholy as a kind of desperation and "sickness of the soul without any hope or expectation of amendment" (quoted in Jackson 1986, p. 331; cf. Rubin 1994). Significantly, then, Capps (2001) has argued for the image of the pastor as an agent of hope (on depression, cf. pp. 101ff.). Depression and melancholia are obviously significant to pastoral care professionals, though mental illness in general receives very little attention in seminary education (Capps 2005, p. 1), even while there are excellent books available (Ciarrocchi 1993; Collins and Culbertson 2003).

Donald Capps on Male and Female Melancholia

Capps defines male melancholia as a form of religiousness that emerges in men's early childhood through their relationship to their mothers. This male melancholic religion "may or may not manifest itself in religious observances, commitment to spiritual disciplines, or religious participation in social causes or in acts of personal sacrifice" (Capps 2002, p. xvi). In fact, it is more often the case that men are *not* religious in these conventional ways but are often religious in experiential (in contrast to institutional) ways (cf. Capps 2007a, p. 256). As strange as it might sound, men are often religious in ways that, on the surface, do not resemble religion. But by understanding the origins of male melancholia, one can

then see how men are religious in unconventional ways.

When boys emotionally separate from their mothers (normally between ages 3 and 5), they acquire an ambivalent attitude toward their mothers because even though, or precisely because, she is still around, things are not the same. "Why has mother abandoned me?" the boy asks himself. And he also wonders, "Can this loss be reversed – and if so, what can I do to reverse it?" "[T]he very ambiguity of this situation," Capps writes, "and the anxieties that such ambiguity promotes are of key importance to the emotional separation that occurs between a small boy and his mother, and this separation is reflected in the form and style of men's religious proclivities" (2004, p. 108). Since all boys separate from their mothers, all men suffer from melancholia, and all men, therefore, are religious in this sense.

Capps suggests that male religiousness takes three forms, which are all directly related to the boy's separation from his mother. The first of men's religious proclivities is the religion of honor. By being a "good boy," men attempt to "win" their mothers back, perhaps by doing well in school, by earning a lot of money, or by achieving remarkable social standing. The second main proclivity is the religion of hope, and here men attempt to find a replacement for their mothers by finding someone like her or something to replace her. Here men might take interest in literal quests, such as traveling, or the quests can be of a more symbolic nature. The third religious proclivity, which Capps (2002) added in his *Men and Their Religion: Honor, Hope, and Humor*, is the religion of humor, "which stands overagainst the first two ways of being religious in the sense that it humors them" (Capps 2004, p. 108). This way of being religious asks, "Can one really win mother back, and can one really find a replacement?" It may also ask, "And why would one *want* to win mother back?" The religions of honor and hope may have their successes, but they have their defeats and disappointments as well, and one way that a man might cope with the latter is to develop a humorous attitude toward the first two ways of being religious. Here, Capps argues men make light of the commitments and efforts that they engender,

and by doing so they save themselves from bitterness and despair. The religion of humor accepts the reality of the loss yet refuses to be defeated by this loss. If male melancholia has no cure, Capps suggests that humor is a pretty good antibiotic. Put in theological terms, if the religion of honor correlates with what Christian theology calls "works," and the religion of hope fits with a mystical searching, often marked by tentativeness and doubt, the religion of humor, for Capps, paves the way for the religious notion of grace. The other forms of religion involve doing, whether by working or searching, but the religion of humor is simply being, mocking and relativizing doing. Honor and hope are retained but in a relativized form.

But what about women? Where do they fit into Capps's theory? In *Men and Their Religion*, a sequel to *Men, Religion, and Melancholia*, Capps (2002) notes psychoanalyst Julia Kristeva's view on the etiology of female melancholia. In *Black Sun*, Capps notes that Kristeva argues that female melancholia "is traceable to the two to three-year-old girl's need to begin adopting the dominant . . . language of her culture, which is male-oriented, and thus to leave the security of her mother's language world" (p. 5). Capps notes that Kristeva cites studies that link signs of depression with language acquisition. If this theory is correct, Capps suggests, then "it would follow that boys adapt more naturally to the symbolic language of patriarchal culture and are therefore less subject to lasting melancholia as a consequence of language acquisition" (2002, p. 5). Capps believes this argument has considerable merit. And it may also explain why more women than men suffer from depression.

In his work on the psychology of men, Capps has been greatly influenced by his mentor James Dittes. On the differences between boys and girls, men and women, Dittes (1996) writes:

Girls have the advantage that their primary caregiver (and life-giver) can be their primary role model. They know they are to grow up female, and to learn how to do that – how to behave and feel and think of themselves as female – they have both model and encouragement at hand in the person they are already closest to and dependent on (p. 24).

“For a boy,” Dittes writes, “it is not that easy. He knows he is to grow up male, and he also recognizes early on that to achieve this he must not honor and strengthen but disrupt the bonds between himself and his primary caregiver, his life-giver” (1996, p. 24). And so, “being male costs a connectedness with life” (Dittes 1996, p. 25). If Kristeva is correct, being female also costs a connectedness with life, but this cost is different than the one men pay, and it is one in fact that they would share with their mothers, perhaps even strengthening their bond. For more discussion on melancholia and gender, see Schiesari (1992), and for more of a discussion on mourning and melancholia in light of Kristeva’s work, see Diane Jonte-Pace (2008).

Mental Illness and Religion

Anisah Bagasra

Department of Psychological Science,
Kennesaw State University,
Kennesaw, GA, USA

Religion, for many, is an integral part of their daily lives, manifesting itself in forms of belief and practice, implicit and explicit attitudes, and decision-making. Religion, therefore, can guide an individual's conceptions of mental illness and beliefs about treatment of mental illness. Religious coping and traditional healing rooted in religious traditions are techniques used by some individuals suffering from mental illness. Religious imagery, language, and behaviors can also manifest themselves as part of the symptoms of a variety of mental health issues, especially noted in psychotic disorders and schizophrenia (Cook 2015). Research has also explored the impact of spiritual emergence emergencies (See entry on ► [Spiritual Emergence](#)) and religious crisis on mental health, leading to the creation of a separate DSM category in 1994 on religious and spiritual problems (Lukoff et al. 1998). Additionally, researchers are interested in the role religion plays in mental health outcomes; specifically, is there a relationship between religion and prevalence of mental illness. Put more plainly, researchers are interested in whether religion is beneficial or detrimental for a person's mental health.

Religion and Conceptions of Mental Illness

Previous research has acknowledged the role that religion can play in the way individuals interpret and approach illness. Most religious traditions have established conceptions of the causation and treatment of mental illness. These include psycho-spiritual origins of mental illness such as those resulting from the will of God, a test from God, or a result of sinful behaviors. The alignment

of spiritual health with mental health can be seen in religious traditions ranging from Fundamentalist Protestants (Malony 1998) to Muslims (Bagasra and Mackinem 2014). They also include supernatural origins of mental illness such as spirit, demonic or jinn possession, evil eye, and black magic. Supernatural causation of mental illness can be found in the Christian tradition (Mercer 2013), Islamic tradition (Islam and Campbell 2014), Hindu tradition (Sapkota et al. 2014), Buddhism (Nguyen et al. 2012), many traditional African religions, religious traditions practiced in the Caribbean, Eastern religious traditions, and most indigenous spiritual traditions. Spirit possession is commonly associated with symptoms that would most likely lead to a diagnosis of schizophrenia and psychosis with the contemporary biomedical model of mental illness. Acceptance of these causations ranges widely depending upon the cultural context and level of religiosity within individuals and communities. Explanatory models of mental illness are strongly influenced by religion in areas with less exposure to the Western biomedical model of mental health, distrust of medical professionals and researchers, stigma, and in more collectivistic societies (Padayachee and Laher 2014). There is also a great deal of overlap with many religious communities viewing mental illness as spiritual, environmental, and biomedical. Religious communities in which prejudice and discrimination are a regular part of their lived experiences are more likely to include trauma, the stress of war, and stress of discrimination as possible causes of mental illness. Multidimensional models of mental illness are therefore prevalent within contemporary followers of many religious traditions.

Religion and Treatment of Mental Illness

Religion can serve as tools for the treatment of mental illness and related psychological issues. Much research has been conducted in the last 20 years acknowledging that religion and spirituality can facilitate recovery from various types of illness, including mental illness (Fallot 1998;

Koenig 1998; Lukoff et al. 1998; Shafranske 1997). Koenig (2005) highlights the role of local religious congregations, faith-based services, and faith-integrated counseling in improving mental health outcomes. Pastoral and clergy counseling, perhaps the most developed of the faith-based treatments, can serve as a positive example of how faith and healing from mental illness can be effective partners (See entry on ► [Pastoral Psychotherapy and Pastoral Counseling](#)). Christian-based counseling programs have gained in popularity, increasing the competency of clergy and non-clergy who want to integrate faith into their therapeutic practices (McMinn et al. 2010). Other religious traditions have their own forms of therapy to treat mental illness including Zen therapy (Brazier 1995) and Islamic therapies (Abu-Raiya and Pargament 2010). Spiritually oriented therapies and interventions are being increasingly explored in both research and practice (Walker and Hathaway 2013; Aten et al. 2011).

Religiosity and Mental Health Outcomes

Many studies have examined the link between an individual's level of religiosity or religious commitment and mental health (Baker and Cruickshank 2009; George et al. 2002). These studies have resulted in mixed findings, with some studies suggesting high religiosity, and religious involvement is linked to better mental and physical health outcomes (Koenig 1998; Koenig et al. 1998; Sternthal et al. 2010), while other studies have found high levels of religiosity or specific religious affiliation correlated with certain mental illnesses such as anxiety and depression. Gartner (1996) noted that some of these studies have shown no relationship between religion and mental health, whereas others have shown either negative or positive relationships between religiosity and either positive or poor mental health. Gartner notes, however, that measures of actual religious behavior did influence outcomes. Religious participation was correlated more positively with mental health outcomes

than measurements of religiosity through scales. Current research in the area of religion and mental health outcomes suggest that religious individuals benefit from the support of their communities, religious coping tools, and explanatory models of mental illness that avoid placing blame for the illness on the individual.

Conclusion

As with many areas of research in the discipline of psychology of religion, additional study needs to be conducted to gain a full picture of how religion impacts interpretation of mental illness, manifestations of psychopathology in different contexts, treatment of mental illness, and mental health outcomes. Most importantly, more research needs to be conducted within international settings and encompassing a wider range of religious traditions. An analysis of religious or spiritual therapies outside of the major religions is largely missing from the current literature. Indigenous traditions have much to offer in terms of multidimensional explanatory models of mental illness. In addition, the impact of religious discrimination in many parts of the world targeting minority religious groups has an impact on mental health outcomes for individuals who endure the brunt of such discrimination. The long-term impact of such stressors and the role of religion in resiliency are future avenues for research. The increase in religious and spiritual therapies in psychology is continued evidence of the interconnection of religion and mental health.

Merton, Thomas

Fredrica R. Halligan

Mind Body Spirit Institute, Stamford, CT, USA

For Catholics and other Christians, Thomas Merton (1915–1968) has been a role model both for the contemplative life and for openness to the interfaith dialogue, in particular the sharing and learning from Eastern religions. A best-selling author, Merton first became famous for his autobiography *Seven Story Mountain*, in which he documented his conversion to the Roman Catholic faith. Death touched him early: he lost his mother at age 6 and his father at 15. Both his

parents had been artists and Protestants. Tom traveled extensively in Europe and was deeply moved by religious art. After he was orphaned, he was raised by his grandfather and attended private school in England, followed by a flamboyant and disastrous year at Cambridge. He returned to the USA and attended Columbia where, under the mentoring of Mark Van Doren, he began serious writing. While at Columbia, he also turned to Catholicism, and in 1938 he was baptized a Catholic. Three years later, he joined the contemplative Cistercian (Trappist) Abbey in Gethsemani, Kentucky. He chose the strictest order to do penance for his sins.

Contemplation and Activism

In his 27 years of religious life, Merton struggled with the contrast of strict monastic rule and the role he played in “the world” as he became increasingly popular, writing poetry, fiction, journals, and spiritual prose. Among his fellow monks and priests, Merton (who was known there as Fr. Louis) was both fun loving and deeply serious in this spiritual quest. He became novice master and was much beloved for his wisdom and his wit.

Thomas Merton was highly intelligent, a voracious reader, and deeply interested in all forms of contemplative experience. He corresponded with some of the great spiritual leaders of the East, including Buddhists, Hindus, and Moslems. He was spiritually nourished by this correspondence and by his own exploration of the inner life. In 1960 he was granted special permission to spend his days (part-time) as a hermit where, in addition to praying, he joyfully continued to study, write, and communicate via letters in a vast and burgeoning interfaith dialogue. The Dalai Lama, for example, treasured Thomas Merton for his intelligence, creativity, wisdom, humor, openness, commitment, and religious zeal.

In the 1960s when the Church was changing due to Vatican II and the USA was changing due to the civil rights movement and the Vietnam war protests, Merton became an activist by the “power of his pen.” *Conjectures of a Guilty Bystander* is an example of this social activism. He wrote

passionately about the Christian’s responsibility for humanity, including responsibility to speak up against injustice, prejudice, and war. Thomas Merton, the man, knew both pleasure and pain in his life; he shied away from neither. As a monk and writer, his genius lay in his capacity to express both intense pleasure and intense suffering, all with a sense for the whole.

Turning Eastward

Merton found in Eastern contemplation the same emphasis he valued from Western monasticism: silence, solitude, simplicity, emptiness, treasuring the sacred in the ordinary, surrender, meditation, and prayer. In 1968 he was invited to give two talks at interfaith events in Bangkok and India. In preparing for that journey, he read extensively in Tibetan Buddhism and Zen, Islam and Sufism, and Vedanta. He wrote a journal during his travels in the East which was published as *The Asian Journal of Thomas Merton*. In it he reflected on every aspect of his thought and varied experiences. He wrote, for example, about the abiding value of the interreligious dialogue:

... we can see the special value of dialogue and exchange among those in the various religions who seek to penetrate the ultimate ground of their beliefs by transformation of religious consciousness. We can see the point of sharing in those disciplines which claim to prepare the way for “mystical” self-transcendence. ... Without asserting that there is complete unity of all religions at the “top,” the transcendent or mystical level. . . it is certainly true to say that even where there are irreconcilable differences in doctrine and in formulated belief, there may still be great similarities and analogues in the realm of religious experience. ... [H]oly men like St. Francis and Ramakrishna (to mention only two) have attained to a level of spiritual fulfillment which is at once universally recognizable and relevant to anyone interested in the religious dimension of existence. Cultural and doctrinal differences must remain, but they do not invalidate a very real quality of existential likeness (Merton 1975, p. 311f).

Merton was on the cutting edge of East–West dialogue, and he opened the door for believing Christians to follow his footsteps in the dialogic encounter with Eastern thought. In October 1968, just after completing one of his planned talks, he went to his room to shower and rest. He

accidentally touched a fan in the bathroom that had faulty wiring and was immediately electrocuted. His death was a blow to all who knew him.

But his death itself gave a final exclamation to his closing offering at the first spiritual summit conference in Calcutta. He so eloquently expressed this prayer which remains as his final wisdom for all spiritual aspirants:

Oh God, we are one with You. You have made us one with You. You have taught us that if we are open to one another, You dwell in us. Help us to preserve this openness and to fight for it with all our hearts. Help us to realize that there can be no understanding where there is mutual rejection. Oh God, in accepting one another wholeheartedly, fully, completely, we accept You, and we thank You, and we adore You, and we love You with our whole being. Our spirit is rooted in Your Spirit. Fill us then with love, and let us be bound together with love as we go our diverse ways, until in this one spirit which makes You present in the world, and which makes You witness to the ultimate reality that is love. Love has overcome. Love is victorious. Amen (Merton 1975, p. 318f).

Metanoia

Thomas Cattoi
Jesuit School of Theology at Santa Clara
University and Graduate Theological Union,
Berkeley, CA, USA

The term *metanoia* comes from the Greek *meta* (after, beyond) and *nous* (intellect, or mind). In Classical Greek, *metanoia* indicated changing

one's mind or opinion and sometimes symbolized the virtue of repentance. Polybius (ca. 208–126 BCE) uses *metanoia* when he tells the story of the Dardani, a people who had moved war on Macedonia while its king Philip was away, but “changed their mind” and left when they heard that Philip was coming back (*Histories*, 4, 66, 7). More philosophical uses of *metanoia* tend to personify it as a female semi-divine figure symbolizing repentance: in his treatise *On the Virtues*, Philo (25 BCE–50 CE) introduces *metanoia* as a daughter of God, dwelling in the highest heavens and interceding with God on behalf of humanity (Gray and O'Day 2008).

It is thanks to the New Testament use of *metanoia*, however, that the term acquires its enduring cultural and theological significance. While the verb *metamelomai* denotes regret or sorrow in situations that are painful and unpleasant – Judas' regretting his betrayal of Jesus in Matt 27: 3 – *metanoia* and its cognate *metanoëō* indicate a conversion or a change of heart after hearing a call for repentance. The oldest use of *metanoia* in this sense is probably the passage in Mark 1 when Jesus announces that the kingdom of God is at hand. The New Testament contains 22 instances of *metanoia* and *metanoëō*.

The writings of the Greek Fathers and the *Philokalia* make great use of the term *metanoia* and deploy it to mark the initial stage of the spiritual life – a moment characterized by the rejection of one's previous opinions and attachments. In the *Shepherd of Hermas*, *metanoia* indicates an all-encompassing change in personality that comprises the intellectual, the ethical, and the affective dimension (Ehrman 2003). The classical Latin translation, rather than *convertere*, was *poenitentiam agere* – a choice deplored by Tertullian as *convertere* comes closer to the notion of change of heart or character implied by *metanoia* (Anton 2005).

The Medieval Western Christian tradition would move away from the Neo-Platonic paradigm of early Greek Christianity and use the language of *anima* (soul), rather than *nous* (intellect, or mind) In the sixteenth century, the reading of *metanoia* offered by the reformers emphasized the centrality of grace: in a letter to John Staupitz where he defended his *Ninety-Five Theses*, Luther

underscored how “*metanoia* signifies a change of the mind of the heart [...], but also a manner of changing it, i.e. the grace of God.” Modern and contemporary Christian literature continues to translate *metanoia* as conversion or repentance.

In the context of modern psychology, William James first used the term *metanoia* in the *Principles of Psychology* to indicate a fundamental transformation in the human personality (1890). In the *Structures and Dynamics of the Psyche*, Carl Jung used the term *metanoia* to indicate the radical reconfiguration of one's own inner life that takes place at moments of crisis such as a major existential challenge or a psychotic breakdown. Such process would ensure the elimination of maladaptive inner structures and the emergence of a more integrated personality that retrieves suppressed elements of one's own shadow (1960). In the antipsychiatry movement spearheaded by R.D. Laing, the term *metanoia* indicates a deep inner transformation that reshapes the way in which individuals present themselves in society (Cooper 1974). In the school of transactional analysis developed by Eric Berne, *metanoia* indicates the encounter with one's own inner void that leads one to abandon one's own inadequate self-understanding and embrace a more authentic self (Clarkson 1977).

Method in Psychology and Religion

Christos Orfanidis
University of Toronto, Toronto, Canada
Aristotle University of Thessaloniki,
Thessaloniki, Greece

From the emergence of the scientific study of religion, we observe the already matured social sciences, including psychology, acting as continuous sources of inspiration and guidance on the ways religious behavior can be studied. Although it seems like psychology and religious studies have generally followed distinctive courses of inquiry, their strong intersections result in many synergies. These synergies have added even more to the already existing plurality of methods in both fields. As a result, the search for the most appropriate method(s) for the concentrating point of inquiry renders the methodological architecture a very delicate craft (Slife and Melling 2012).

This entry could not have included a thorough analysis or even a list of every method used in

research on psychology and religion. Instead, it constitutes a theoretical panorama of methodological prospects, issues, and potentialities of tested methods and current trends, providing a concise overview of different methodological directions and the relevant criticism. Research methods in studies of psychology and religion generally fall under the categorization of qualitative, quantitative, and mixed methods, and within these categories they are subsequently analyzed.

Qualitative Methods

Qualitative research concentrates on acquiring in depth and usually microscaled information. It would be fair to claim that a big part of qualitative research in religion and psychology is represented by psychoanalytical work. Psychoanalytical perspectives developed their own methodological tools, a toolbox that seems to deduct individualized qualitative data. This individualistic perspective necessitated to an ongoing meta-methodological reconsideration on various patterns of analysis of the self. Thus, we can understand why the Jungian intraphysic model in the paradigm of analytical psychology, for instance, has resulted to multiple and multivariable later versions, while the Jungian approach itself was also considered a newer version of previous psychoanalytical ideas (Aziz 1990).

Due to the generally personalized agenda of qualitative research, qualitative data, such as religious and spiritual experiences, reach the researcher in the way that they are described by research participants (Coyle 2008). These descriptions during an interview, for example, will be perceived and re-described and interpreted by the researcher, raising a serious epistemological issue on whether recipients of such research works are being rendered readers of the researcher's views or re-readings (Nelson 2009). In addition, broader macroscopic approaches have been designed. Psychoanalytic cultural analysis, for example, examines the interactive dynamics of culture with the individual, utilizing interpretative tools from the gulf of psychoanalysis (Frie 2014). Furthermore,

psychoanalytic individualist approaches keep inspiring practitioners involved in pastoral counseling, indicating their practicality and direct applicability, raising however questions regarding how scientific knowledge can be sufficiently and successfully implemented with spiritual disciplines (Erickson 1987).

Quantitative Methods

The main concept of quantitative methodology is measurement. Consequently, the big issue that arises concerns the measurability of religious behavior, identity, and experience. Scholars of religion inspired by positivist and neo-positivist waves of thought maintain a strong position that arithmetic models and even tools of the natural sciences can be sufficiently utilized towards the achievement of that scope. On the contrary, other scholars claim that the reduction of religious experiences to numbers may generate various forms of abstract relativity and the actual aim of metrical approaches, which is the precise measurement and categorization, may prove to bring the opposite outcome (Alwin et al. 2006). Such scholars usually concentrate on the problems of measurement of qualitative characteristics and have alternatively developed different scales of categorization, which adapt to different cultural settings (Cohen et al. 2017).

Numerical religious researches' concentration has demonstrated that there has been a strong interest lately on global macroscale quantitative research and on attempting to predict (partially) the future dynamics of religious patterns, choices, and trends as well as the extent of religiosity of specific populaces. Such kind of research involves big data and utilizes a series of advanced computational techniques, shaping for some the future of digital humanities and bringing on the surface new accompanied ethical questions (Fuller 2015). It should be noted that quantitative research concentrates on specific cases, time frameworks, and geographical contexts. Thus, generalized conclusions should be drawn with caution and should be perceived as initiating points for future inquiry.

Mixed and Interdisciplinary Methods

In current research trends, it is observable that more and more scholars are sharing the conviction that religion is a spectral phenomenon and as such it requires spectral approaches. When properly designed and executed, mixed and interdisciplinary methods can constitute a very functional way of acquiring multifaceted knowledge. Qualitative knowledge can complement quantitative research and vice versa, in an effort of productively gathering and analyzing data, especially when the data comprise variables both quantifiable and interpretative, which is many times the case in religious research.

Such multimethodological patterns have given birth to interesting hybrid modes of inquiry, which would initially seem as mutually excluded, such as experimental ethnography (Sherman and Strang 2004). Significant research has been conducted so far regarding this method, especially in the exploration of ritual effects and their connection to biological bases of social and personal behavior within the community (Xygalatas 2014). The methodological paradigm of experimental ethnography proves that in a sense the lab can be set out in the field also in the social sciences, and methods such as ethnography and experimentation, which have been traditionally perceived as mainly anthropological and psychological respectively, can be harmonically combined to produce new ways of acquiring in-depth and multi-perspective knowledge.

Mid-life Transitions

Ann Moir-Bussy
School of Social Sciences, University of Sunshine Coast, Sippy Downs, QLD, Australia

Arriving at Mid-life

There are many transitions in our lives – from childhood to adolescence to adulthood, forging a

career, changing career, entering marriage, and beginning a family through to retirement. The morning of life is generally busy, full of external focus, building a strong ego, and either striving to make a mark in the world or, for some, simply surviving, raising children, and hopefully finding a balance between work, family, and life. The morning of life is often so busy that almost imperceptibly we find that we have arrived at mid-life and, as the poet and writer David Whyte describes it, we find ourselves facing the “great unknown.”

From both a religious and psychological perspective, much has been written about the journey through mid-life. Fowler (1995), in his book *Stages of Faith*, looks at it from the religious perspective and the stages of development in faith. Faith for him is a universal quality of life and is a dynamic evolving process. He sees the middle adulthood stage as that of Conjunctive Faith – a time when one moves beyond focus on the ego, opens out to others, and also becomes open to paradox and opposing viewpoints. He also notes that many can stuck be in this stage as it often leads to a crisis in faith and that the journey through to a universalizing faith is one of letting go of past constructs and ideas, where one needs to transcend specific beliefs and embraces a sense of oneness with all beings. This time can be both a religious and psychological mid-life transition.

The arrival at mid-life is also eloquently expressed by Dante Alighieri (1971) in his *Divine Comedy*. Dante was born in Florence in 1265 to a noble but impoverished family. His mother died when he was very young. At age 9 he met and became emotionally attached to Bice Portinari, who he called Beatrice – “bringer of blessings.” As a young adult, he became involved in the strife between the Guelphs and the Ghibellines and was condemned to exile. In this time of exile, he wrote his *Divine Comedy* – his journey to finding his own center. He begins by telling how in the middle of his life he awoke lost:

Midway along the journey of our life
I woke to find myself in a dark wood
For I had wandered off from the straight path.
How I entered there I cannot truly say,
I had become sleepy at the moment
When I first strayed, leaving the path of truth.

Dante is 35 years old – and in the dark wood, filled with fear and apprehension, he suddenly realizes he has missed his true path. Before he can find his true path, he has to travel to the depths (the inferno) and then on the mountain of Purgatory, learn that he has to take time to go inward, and trust in each step as he faces the great unknown. For many people, the arrival at mid-life is like Dante awakening to find oneself lost – elements of restlessness, discontent with the way life is unfolding – sometimes a frantic energy or wanting to do something completely different from what one has been doing. Mid-life transition can span several years, and the term mid-life crisis was coined to express what many experience as a crisis of meaning where one can no longer avoid the questions that surface into consciousness.

Transitional passages are a liminal time/space between one way of being and another. They are a time when the conscious views we have developed over the early years seem to be no longer available to us, and it may feel that we have fallen asleep on the road as with Dante. It is also a time when childhood faith can be challenged or tested.

Journey Through Crisis

Crisis in mid-life appears in varied ways and may include illness, death, relationship breakup, loss of career, and physical, psychological, or/and spiritual suffering. Accepted roles, values, our identity, and the familiar road map are all called into question in a substantial way. The inner voice can no longer be ignored.

However, the Chinese character for the word “crisis” carries two images – on the one hand, danger and, on the other, opportunity. It is a time of psychological or spiritual transformation.

Mystic and ascetic, John of the Cross referred to it as the dark night of the soul (See John of the Cross). For him it was a time to purge the self of ego and to open himself to the divine in order to become one with God.

In the Bible when Moses is called to the mountain, he is ordered to “Take off your shoes you are standing on holy ground.” The Hasidic word for

taking off the shoes in this scene means to shed your shoes in the same way as an animal sheds its skin. Moses then finds himself in this vulnerability standing on holy ground – the ground of his own divine being in God. It is a process of letting go of what has been before, letting go of living only the outer life, and standing on holy ground and paying attention to the inner life. It requires solitude and aloneness. Jesus also spent 40 days in the desert alone, facing the demons, and he could then move to the journey of death and resurrection.

Carmelite, John Welch (1982), in his book *Spiritual Pilgrims* contrasts Jung's idea of the journey to individuation and the path through mid-life to Teresa of Avila's journey in *The Interior Castle*. Teresa's movement through the castle corresponds with Jung's development of the ego – the first being controlling and active and the second phase similar to the mid-life transition where one needs to be receptive and letting go. Teresa's description of the early part reflects a one-sided development, all consuming, busy establishing oneself. She regards this as living only in the outer rooms of the castle. She sees the move to the entrance to the inner rooms as a call to become more aware of the inner life and, in religious terms, the call to deeper prayer and attention to the call from God to grow. This is the mid-life transition.

Ancient mythology has many similar images of the mid-life transition – such as the night sea crossing when one finds oneself in the dark, completely alone, no land behind, and no sight of the destination. Carl Jung (1945) says that the night sea journey is a “kind of *descensus ad inferos*—a descent into Hades and a journey to the land of ghosts somewhere beyond this world, beyond consciousness, hence an immersion in the unconscious” [“The Psychology of the Transference,” CW 16, par. 455.]. The night sea journey is associated with the sun setting in the west and traveling underwater to the east to rise again – a time in our life when we can be trapped by dark thoughts, loss of meaning, and a sense of isolation, but then coming through this to a new sense of consciousness. Biblical Jonah journeyed through this dark night in the belly of the whale.

We must not be passive; however, we must inhabit the journey as fully as we can.

Another mythological example is that of Inanna, Queen of the skies and the earth who travels to the underworld in a journey of personal growth because her understanding of life is limited. To make this journey, she has to give up her earthly powers – it is a journey into the unknown and she is full of apprehension. She covers herself with her seven veils, crowns, jewels, and costumes that are manifestations of her identity, thinking they will protect her like a talisman. This great unknown is ruled over by Ereshkigal, her sister. She has no compassions for relationships and she has just lost her own husband. When Inanna arrives, Ereshkigal is seized with jealousy at her beauty and has her stripped and hung on a peg like a rotting corpse. She is finally rescued by the God of wisdom, Enki, and she returns with new insight and a better experience of the complete cycle of existence (Gadon 1989).

Mid-life transition is a liminal experience where we find ourselves in that space in between. We cannot go back to the former way of living as this will lead to death. We have not yet arrived or, rather, have not yet found the new guiding values that will lead us in the second half of life. As Carl Jung said, “The afternoon of life is just as full of meaning as the morning, only its meaning and purpose are different. But we cannot live the afternoon of life according to the program of life's morning, for what was great in the morning will be little at evening and what in the morning was true, at evening will have become a lie.”

Embracing Mid-life Transition

David Whyte, poet and author, refers to the story of Moses, who, when told to take off his shoes, looks down and realizes he is standing on holy ground and that he has been all his life standing in the ground of his own experience with the Deity. It is coming to this realization that we have been living in exile and are not living the way we could have – there is more to life than the outer glamour, wealth, or status. This is indeed a powerful

metaphor for the experience of the mid-life transition as we find ourselves going through an awkward dismemberment and falling away of old skins and old values that no longer serve us, and we must confront our own reality and our own mortality and bring compassion to our own existence. It is a time to stop comparing ourselves to other people, to stop striving to be part of the status quo, and to embrace our own solitude and reflect, “What is my question? What question am I living? What questions have I been living since the moment I was born?” As the poet Rilke (1962) once wrote: “Be patient toward all that is unsolved in your heart and... try to love the questions themselves like locked rooms and like books that are written in a very foreign tongue. Do not now seek the answers, which cannot be given you because you would not be able to live them. And the point is to live everything. Live the questions now. Perhaps you will then gradually, without noticing it, live along some distant day into the answer.”

“Courage is the ability to create a relationship with the unknown., to create a form of friendship with what lies around the corner over the horizon – with those things that have not yet fully come into being” Whyte (2003). It is to respond to the situations and transitions in front of us. Mid-life is the period where we are challenged to return to the ground of our own being or as Whyte reminds us that in the Christian tradition, it is to be humbled (humus – soil) – to let go of the fancy ideas we had about ourselves and with elation to greet oneself at one’s own door – in our own mirror. The Chinese philosopher Hua Hu Ching, student of Lao Tsu, once wrote “If you want to awaken all of humanity awaken all of yourself. If you want to eliminate the suffering in the world then eliminate all that is dark and negative in yourself. Truly the greatest gift you have to give is that of your own transformation.” This is our major task as we begin the second half of life – to recover personal authority – that is, to find what is true for oneself and to live it, acknowledging humbly what wishes to come through us into life, and, secondly, to discover our own personal spirituality by being faithful to our own experience. A mature spirituality asks

larger and fiercer questions, and we need to become fiercer, as David Whyte says, more concentrated on the fulcrum on which our lives turn.

Midrash

Mark Popovsky
Department of Pastoral Care, Weill Medical
College of Cornell, New York Presbyterian
Hospital – Chaplaincy, New York, NY, USA

Midrash refers to a genre of classical Jewish biblical interpretation which flourished from the third

century to the thirteenth century. The term derives from the Hebrew verb “to pound” – suggesting that midrash *pounds out* meaning from the biblical text. The literary form refrains from determining one interpretation as normative, allowing for multiple and mutually exclusive interpretations of the biblical text to coexist.

Rarely does midrash attempt to comment on an entire biblical passage; rather it almost always focuses on a particular word, phrase, or individual verse. Following an extremely close reading of the biblical text, the interpreter will point out a textual oddity such as an unusual word choice, a variant spelling, or an unexpected syntax. Holding the premises that the bible’s author is divine and that the text was composed with ultimate economy, an individual midrash endeavors to show how the apparent error was actually intended by God to teach an additional lesson. The remainder of the midrash will expound that point, often making liberal use of wordplays, puns, and convergences of sounds. Similar to psychoanalysis, the midrashic process seeks to find latent meaning implied in the manifest material of the biblical text. Few Jews composed works of philosophy or systematic theology prior to the medieval period; midrash serves as the primary window into how the rabbis of the ancient world viewed God, morality, and the world around them.

Midrash can loosely be divided into two categories: narrative (*aggadic*) and legal (*halakhic*). Biblical style is typically laconic. The text provides only flashes of dialog and almost never directly reveals a character’s thoughts or emotions. Narrative midrash attempts to fill these gaps in the text, playfully imagining missing dialog, background stories, and motivations for behavior. One common method is to shift the reader’s point of view, retelling the story from the perspective of a peripheral or altogether invented character. This undermines the reader’s confidence in objective inquiry and directs his or her attention towards the relational field. Like many psychological interventions, the midrashic process provides individuals with license to

explore, question, and refashion narratives that may initially appear immutable.

Legal midrash purports to deduce practical rules for worship, daily life, and moral behavior from a biblical text which appeared sometimes too vague and sometimes simply outdated to its rabbinic interpreters. For example, the Bible commands that Israelites refrain from work on the Sabbath, but it provides no definition of work. The Sabbath laws observed today by religious Jews develop directly from midrashic efforts to elucidate specific practices relying on subtle clues within the generally silent biblical text.

Midrashic interpretation is traditionally viewed as divine in origin; consequently, rules derived through legal midrash are considered by rabbinic authorities as if they were stated explicitly in the Bible. Midrash served as a tool to connect sometimes radical innovations in religious practice to the biblical text itself, thus maintaining a direct link between devotee and scripture despite significant transformations in normative behavior over time. As Jewish tradition evolved through its encounters with other cultures and new technologies, midrash became the primary means by which rabbis validated these developments as consistent with divine will.

Migrant Acceptability and Unacceptability in the Psychology of Religion

Sajaudeen Chapparban

Centre for Diaspora Studies, Central University of Gujarat, Gandhinagar, Gujarat, India

Religion plays a very significant role in the process of migration from ancient times to the present. History of all major religions in the World witness and experience the episodes of migration and diaspora directly and indirectly either to save faith/people or spread faith. Religions like Islam, Judaism, and Christianity have the references of migration and exile within their scriptures too.

In Islam, the idea of *Hijrat* (migration) and the migration of Prophet Muhammad (Peace be Upon Him) along with his companions from Mecca to Medina plays crucial role in the history and psychology of Muslims. The Holy Quran instructs the believers to migrate from one place to another place when the situations are not comfortable. One of the major reasons to migrate in Islam is for the sake of *Din*/belief and for the sake of Allah. If a believer feels that s/he cannot practice his/her religion freely then s/he should migrate to a place where one can practice it without any difficulty. This has also shaped the thinking and migration process of Muslims. Similarly, in the Jewish Zionist philosophy, the concepts of *Yerida* and *Aliyah* have direct reference of migration. *Yerida* means an act of emigration from the land of Israel and *Aliyah* means an immigration of Jews from diaspora to the land of Israel. In the *Book of Deuteronomy*, the word “gault” (exile) is applied to the people of Israel for their dispersion.

Apart from this, religion and its dominance influence the process of migration both in expelling and welcoming the people “in” and “out” of the border. As a psychological agent, religion stimulates or discourages and facilitates or rejects the migrants according to the cultural similarities or dissimilarities of the migrant/group. One such

example is the recent case of forced migration of Rohingyas from Myanmar due to persecution. One of the obvious reasons is that the Rohingyas are linguistically, culturally, and religion wise different from the majority Buddhist community in Myanmar. As a result, the ethnic cleansing and genocide of Rohingya results in the flux of migration to the neighboring states. But when it comes to the question of who has accommodated or not accommodated the Rohingyas or not willing to accommodate is purely due to their religious and cultural similarities and differences. Bangladesh has accommodated almost 70% of the total Rohingya population – and there are not many religious or cultural problems in accommodating this community. But, on the other hand, in India, there was huge hue and cry about accommodating the Rohingya refugees because they are Muslims which was seen as the obvious threat to the majoritarian Hindu society. There was arrest and deportation of some of the Rohingya refugees and even public protest against this community in Jammu. On the contrary, the current Govt. of India has announced the citizenship to the Buddhist and Hindu refugee groups, *Chakma* and *Hajong*, from neighboring countries like Pakistan and Bangladesh. It has also accommodated, without any political or religious discomfort, to the *Shin Khalai* refugees from Afghanistan and the Buddhist Tibetan refugees from Tibet. The more apparent visibility of religion in the context of migration came on the floor when the *Citizenship Amendment Bill* (2016) was proposed and passed in Lok Sabha (House of the People) of India, wherein the Muslim refugees/migrants from the neighboring countries were not considered as refugees/immigrants. Although the Muslims in India's neighboring countries are also discriminated and persecuted, for example, in China (Ughir Muslims), Sri Lanka, Pakistan (the Hazara and Shias), Afghanistan (hazaras and Shias), Myanmar (Rohingyas) etc but they are not given space to reside and apply for citizenship in India as the Hindu and other similar religious communities from the neighboring countries. This bill categorically excluded the Muslim.

The articulation and application of the terms like “illegal migrants” is selectively applied to or made associated with the migrants and refugees from Muslim religious and cultural background in India as the “expat” and “migrants” applied to the whites and non whites in the West.

This way Myanmar’s *Citizenship Act* (1982) excluded Rohingya Muslim community from the nationality imagined and interpreted by the Buddhist majority; similarly, the Bhutan’s *Citizenship Act* (1985) discriminated the Lhotshampa – the Nepalese Hindu community from its Buddhist national imagination. In other words, the politics of exclusion and inclusion in terms of granting or taking out the citizenship is also deeply rooted in the religious identity.

The *invisible visibility* of religion of both the immigrant and the host society works in accepting or rejecting a particular immigrant or an immigrant community. It also controls the migration flows in both the mother land and the host land. Religion also shapes the people’s perceptions and behavior toward the migrants/refugees. Similar is the migrant/refugee’s to culture and religion of host society, the less is the hatred and suspicion. And the more different is migrant/refugee’s to culture and religion of the host society, the more is the hatred and suspicion. This can be seen in almost all migrant and refugee crisis across the globe today.

The dominant religious community in host country *imagines* its own religio-cultural geography, and this geography foresees the arrival of immigrants, who are culturally and religiously different from the geography of host societies, generate the xenophobia and fear of losing dominance, get influenced, hybridized, etc., and if the immigrant’s culture and religion is similar to that of the host societies, then s/he is welcomed and facilitated in the host societies without any excuse and reasons. Such dual approach toward the migrants/refugees is the result of the working of the religio-cultural identity, psychology of religion, and inherent communal animosity in our psyches.

Few examples of dualism in the process of migration or welcoming refugees/migrants can be found with reference to the Buddhist Tibetan and Muslim Rohingya refugees in India. The Tibetan refugees in India are given free space to work and educate and even run the Government in exile. They are given reservation in education and government job sectors because they are Buddhist, and on the other hand, the government is not ready to accommodate the Rohingyas because they are Muslims and in fact planning to deport the existing Rohingyas in India. The ironic part is that the Hindu migrants from Myanmar are given every right including the citizenship. The prominent example is the Chief Minister of the State of Gujarat Mr. Vijay Rupani who is a migrant from Myanmar with his Hindu identity elected at the India’s top most political position.

In the case of Europe and America, the Muslim migrant/refugees are treated as the “other” because of their cultural-religious difference. The host societies always afraid that they would be “Islamize” if Muslims are not control or stop entering the into the homogenized Christian societies of the West.

Recently, this year in a massive rally in Warsaw, Poland, there was a call for “Muslim holocaust” because Poland sees that arrival of Muslim migrants and refugees in Europe as a cultural threat. On the contrary, the same Poland which was unhappy with the arrival of Ukrainian in Poland is now ready to welcome the Ukrainians because they are not Muslims but the Christians.

An Arab migrant from the Muslim cultural-religious background and an Arab of Judo-Christian or Christian background receive different treatments in the Europe and America than an Arab immigrant of Muslim background. In fact, they are not even treated as the “outsider”/“immigrant” and most of the time their immigratory status remains silent. The migrants from the Muslim countries in America/Europe are presumed that they are potential terrorists, ready to commit crimes, or a social bomb about to explode only because they are not Christian. They are often excused while denying entry as the burden on

recourse of the host society. But at the same time, Christian and Jew migrants migrating from Europe to America or vis-à-vis are not even considered as the outsiders because their cultural and religious identities are similar to each other. The growing examples of the attacks on Muslims in the West and the discrimination, violence, suspicion, humiliation, Islamophobia are result of the religious difference of migrants and host societies. Trump's sanctioning and banning the entry of migrants from Muslim countries after taking the oath as the President of America is another such example.

In a nutshell, the imagined geographies of cultural and religious identities of both the migrants and the host societies/countries play important role in accepting or rejecting the migrants and also in initiating both the forced and voluntary migration.

Migration and Religion

Valerie DeMarinis

Uppsala University, Uppsala, Sweden

Introduction

The relationship between and psychological consequences of migration and religion are topics of historically long standing. The age of globalization and patterns of forced migration have brought new attention to this topic. The text is organized into the following sections: cultural function and worldview; voluntary and forced migration; host culture analysis and operant refugee paradigm; and mental health, religion, and trauma.

Cultural Function and Worldview

To understand the psychological implications of the interaction between migration and religion, the function of religion in cultural context needs

to be studied. The pioneering work of Arthur Kleinman in cultural psychiatry (1980) introduced a now internationally used model of the dimensions of culture for analysis of how healthcare systems, types of interaction in healthcare contexts, and patients' cultural understandings of illness and health are constructed. In this model, the symbolic dimension, which includes religious elements and rituals, is pivotal for understanding the deepest levels of how concepts of illness and of health are understood in a given cultural context. As illness and health are culturally influenced constructions, the religious or spiritual way in which these are approached informs the psychosocial and psychoexistential functioning of individuals and groups within the culture. Cultural psychologists Marsella and Yamada (2000) note that culture is a living entity that provides both internal and external artifacts. Included in the external category are societal institutions including religious and healthcare organizations. Included in the internal category are beliefs, rituals, and symbols, including those of a religious or existential nature. A change in one category necessitates attention to the need for change in the other as the internal and external categories are interdependent. The religious or spiritual systems operant in a monocultural or stable multicultural situation provide a means for creating a functioning worldview in which psychosocial and psychocultural understandings and behaviors are contained. Approaching the concept of worldview as a psychological construct, Koltko-Rivera (2004) defines it as a set of assumptions about physical and social reality that may have powerful effects on cognition and behavior. An individual's worldview needs to be studied in relation to personality traits, motivation, affect, cognition, behavior, and culture.

Religious and spiritual beliefs, rituals, and symbols can and very often do function as resources in such mono- or stable multicultural contexts. In cultural contexts where political stability, safety, and religious toleration exist, migration of different minority groups representing different religious traditions can have a positive

outcome for both minority and majority groups. Perhaps the most salutogenic and health-enabling acculturation process, in such cases, would mean that the migrant minority group members find ways to incorporate aspects of the majority culture's external and internal artifacts while maintaining and developing central resources for their psychosocial health and spiritual resilience originating from their original culture (DeMarinis 2003). Thus, a syncretism of cultural resources would emerge over time, experience, and exposure. Majority culture members would also be a part of the acculturation process, learning from and respecting the resources of the minority groups.

Voluntary and Forced Migration

International migration implies a shift from one cultural context to another. Depending on the differences between the old and new cultural contexts, the role of religion or spirituality can have very different consequences for psychosocial adjustment and development. Migration takes place in both voluntary and forced situations. The term "refugee" denotes an individual who is forced to flee in search of safety, in contrast to someone who chooses of their own volition to relocate. Bascom (2001) provides a helpful overview of the geographical and geopolitical dimensions of refugee (forced) migration patterns.

Migration of any kind can cause a dramatic change in the way in which and means by which a person or a group's religious or spiritual expression may function. The more dramatic and traumatic the situation of migration, the more one may expect situations of dysfunction. As Silove (2005) points out, it is important to pay attention to how changes in existential meaning are being handled, especially in situations of forced migration. Values and belief systems, the inner artifacts of culture, can become dysfunctional, leading in extreme cases to alienation and loss. Thus, addressing these areas in response to trauma may assist with the move from trauma to survival. It

therefore becomes necessary through both social and psychological interventions to include room for religious and spiritual expression in cultural reconstruction and adaptation processes. Elements of humanistic and existential material need to be included in counseling and psychotherapy.

Host Culture Analysis and Operant Refugee Paradigm

Another important psychosocial aspect regarding migration and religion is the fit between the host culture and the cultures of the migrating groups, with special attention to refugees. This aspect of research has been understudied but is now receiving much-needed attention. One of the central results of a research study on Polish children's attitudes to refugees (DeMarinis et al. 2001) points to the need for an analysis of functioning religious culture when investigating attitudes of the host culture population. Analysis of this dimension is important when conducting research or designing intervention programs in countries that have a defined religious tradition such as Poland but also as in countries that represent a more secular orientation such as Sweden. Concepts and policies such as religious freedom and tolerance may appear as simple and straightforward on the surface but may be impeded by underlying and underexplored worldview conceptions that often contain suspicious attitudes to certain religious traditions or religious expressions.

Host culture analysis in relation to refugee groups needs to be understood in relation to the operative refugee paradigm. Clearly, a paradigm shift has occurred in international responses to refugees. After September 11, 2001, the *security paradigm* has taken form, where refugees are not infrequently viewed with deep suspicion and in the extreme as being terrorists (Frelick 2007). A sign of this paradigm shift is reflected in the decline of asylum applications in the Western industrialized countries. Refugees are often viewed as moral blackmailers, exploiting the

goodwill of the host nations (Ingleby 2005), or as a result of terrorist threats, a major devaluing of refugees among receiving countries has taken place (Frelick 2007).

A comparison of European and North American attitudes to immigration (Livi-bacci 1994) noted that the factors explaining the different immigration policies in North America and Europe are not economic or demographic but stem rather from history, social structure, the functioning of the labor market, and social mobility. European countries tend to perceive themselves as totally formed and not requiring further cultural contribution. Homogeneity in culture, language, and religion is valued. Finally, in Europe, restrictive policies are in perfect harmony with public opinion.

A study of refugee problems in Europe (Veiter 1988) points out the large influx of refugees coming from places with other cultural and religious attributes. Accordingly, the Islamic immigrants often declare themselves as political refugees and hope to be acknowledged as such by the receiving state. The fear of the governments and populations of the receiving countries is that it will not be possible to assimilate refugees who do not belong to the Christian culture of Europe (Veiter 1988).

Mental Health, Religion, and Trauma

Research on mental health and religion has become timelier because of a resurgence of interest in religious belief and practice in many parts of the world and because of the increased movement of the world's population (Boehnlein 2006). Mental health providers in developed countries increasingly are treating immigrants and refugees whose backgrounds are much different from their own, so it is important for them to understand cultural belief systems, including religious thought and practice that relate to mental health and illness (Bhugra 2004; Ingleby 2005).

During and after traumatic events, individuals frequently report great cognitive dissonance

between what they observe and experience in reality and what they previously believed were stable, secure, and predictable relationships, not only with other individuals but also with the supernatural or the metaphysical (Boehnlein 1987). Incorporating religious and spiritual perspectives in the clinical assessment of patients takes into account the effects of philosophical viewpoints, cultural values, and social attitudes on disease (Fabrega 1977). Religious teachings recognize the transcendental meaning of suffering and the fact that suffering, such as agony, despair, pain, and conflict, belongs to the totality of life (Kirmayer 2008; Rhi 2001).

In PTSD recovery, spiritual awakening can play a role in relieving survivor guilt (Khouzam and Kissmeyer 1997). Traumatic memory and unresolved issues may be helped in psychotherapy through an understanding of and addressing of the rituals of importance to the patient. Working with re-ritualization in the new cultural context, through connection to the patient's religious or meaning making system, may help to create a new perspective and a means of containing painful memory as well as providing a new memory resource (DeMarinis 1996).

Exposure to inexplicable evil, cruelty, and extreme violation can shake and sometimes shatter the foundations of the survivor's existential worldview. The survivor and the community face crises of trust, faith, and meaning (Silove 2005). A very useful conceptual framework for understanding the existential meaning-system in mental health initiatives among refugees in post-conflict societies is the *survival and adaptational model* by Silove (2005). On the level of existential meaning-system, the challenges are to the undermining of cultural and belief systems values. The adaptive responses are existential doubts and the adoption of new/hybrid identities, while the extreme responses are alienation and loss of faith. The social interventions can be made on religious, political, and cultural reconstruction levels. The psychological interventions may include elements of humanistic and existential therapy (Silove 2005).

Several recent studies in different contexts point to the importance of religious coping strategies and resources in the management of traumatic stress after forced migration: Gozdziaik (2002), Hagan and Ebaugh (2003), Myers (2000), and Shoeb et al. (2007). These and other studies are providing a base for understanding the potential of certain kinds of religious engagement and involvement for identifying resources for coping and moving beyond surviving. However, there is the need for caution in examining these results as so many factors are involved at many different levels. Keeping such cautions in mind, three initial observations can be made. First, that religion and spirituality can be beneficial to people in dealing with the aftermath of trauma. Second, that traumatic experience can lead to a deepening of religion or spirituality. Third, that positive religious coping, religious openness, readiness to face existential questions, religious participation, and intrinsic religiousness are factors that may be associated with posttraumatic growth.

Mikveh

Lynn Somerstein

Institute for Expressive Analysis, New York, NY,
USA

The mikveh, a word denoting “the collection or gathering of water,” is a ritual bath used for purification purposes by women, after their menstrual cycle is completed or after childbirth, making a woman ready to resume intimate relations with her husband, and by men, to achieve ritual purity. Women also immerse themselves before the day of their wedding. Immersion in the mikveh is part of the conversion experience, too, symbolizing the change from the old identity to the new Jewish identity. Immersion in the mikveh marks an intermediate step towards a new state. The entire body, including the hair on one’s head, must be totally immersed in the waters of the mikveh.

The mikveh is a deep pool filled with a mixture of pure springwater or rainwater, called living water and tap water. Tap water alone cannot be used because it is pumped. Mikveh water must flow into the pool by natural means, such as gravity, although tap water can be mixed with what is called “living water.” The emphasis on the use of “living water” symbolizes water from the earth, like amniotic fluid from mother earth.

The narrow deep pool of water symbolizes the amniotic fluid; the pool itself is like the womb, a return to the mother. A person totally immersed in the mikveh is like a fetus inside the mother’s body.

New cooking implements are also immersed in the mikveh to ready them for kosher use.
